HALL'S SANITARY WASHABLE DISTEMPER.

THE new specimen card of the colours in which Messrs. Sissons Bros. & Co., Limited, of Hull, now manufacture their excellent water-paint contains upwards of thirty different tints and shades, and all of these are exceptionally bright and pure, and at the same time very solid. This paint, the many excellent qualities of which cannot be too well known, is applicable alike to inside and outside work, and to any surface, whether of metal, wood, stone or brick. It may be put on a damp wall where, it is said, it will last better than oil-paint, and it has a notably hardening effect on plaster which from past dampness or other cause has perished. It does not crack or rub off and is perfectly easy to use, and it only requires to be thinned with a little water, either hot or cold. It has great covering powers, and can be painted on or varnished without previous sizing. Applied to woodwork which it is desired to finish in oil-paint, it makes an excellent filling, stopping all cracks and saving one of the finishing coats of the paint. It is essentially sanitary, and at the same time is death to vermin. It is, moreover, cheap in price and economical in use; in fact, Messrs. Sissons claim for it that it saves altogether about 80 per cent. as compared with oil-paint.

FIRES IN HOTELS.

AN engineer writes:—"While the great fire at the Hotel Windsor, in New York, is still fresh in the memories of every one, I think it is important that we should remember that no building can be considered absolutely fireproof while combustible materials are kept in it. In most of our hotels large quantities of inflammable goods are always on the premises, such as coal, wood, linen, oil and much besides. Were an outbreak to occur among these materials, very considerable damage might be done and great expense incurred; for although such a fire could not spread to any great extent, owing to the way in which most of our hotels are constructed, there would be nothing to check its progress until the fire reached one or more of the fireproof walls. It is therefore very necessary that some means for checking these comparatively small outbreaks should be provided in every hotel. Those who have stayed at the Royal Pavilion Hotel at Folkestone will have noticed the means for fire-extinguishment employed there. The Merryweather firm have fitted up very complete arrangements for the protection of visitors to this hotel from fire. Another hotel which I have noticed as being so fitted is the Savoy, London, where a very complete installation is provided. Those whose duties compel them to be constantly travelling about must feel the necessity for better fire protection in our hotels, and I most sincerely wish that all hotels were similarly equipped to those I have named."

A SILENT PAVEMENT.

THE North British Rubber Company may be cordially congratulated on having supplied a manifest want in a very thorough manner. We refer to the pavement which they have laid in the *porte cochère* of Claridge's Hotel.

This is made of a special quality of hard rubber and answers admirably the purpose to which it is applied. It is made in sheets about an inch in thickness and is laid on a bed of concrete, to which it is attached by means of solution. It cannot be claimed for this pavement that it is the cheapest on the market, but it may certainly be said that it possesses advantages to which others can have no pretence, and not the least of these is that it is absolutely noiseless. That it is durable is demonstrated by the section which was laid as long ago as ten to twelve years at the entrance to St. Pancras Station, which by nature of its position is subject to continuous hard wear, and is still practically as good as when laid down; in fact, the company claim for it that it is everlasting.

It can be made in various designs and colours, and is particularly suitable to such positions as quadrangles or courtyards of hotels, mansions, flats, &c.

"HE'S A BRICK."—Plutarch, in his life of Agesilaus, king of Sparta, gives the origin of this expression, which is regarded as slang. On a certain occasion an ambassador from Epirus inquired where were the walls and battlements to his capital. The king led the ambassador out on the plains where his army was drawn up in full battle array, and, pointing proudly to the serried hosts, he said, "There, behold thou the walls of Sparta—10,000 men—and every man a brick." This is one piece of classic "slang."

TRADE NOTES.

ESSRS. MELLOWES & Co., of Sheffield and London, have ently completed the roof glazing of the new Nottingham st Office on their eclipse patent imperishable system.

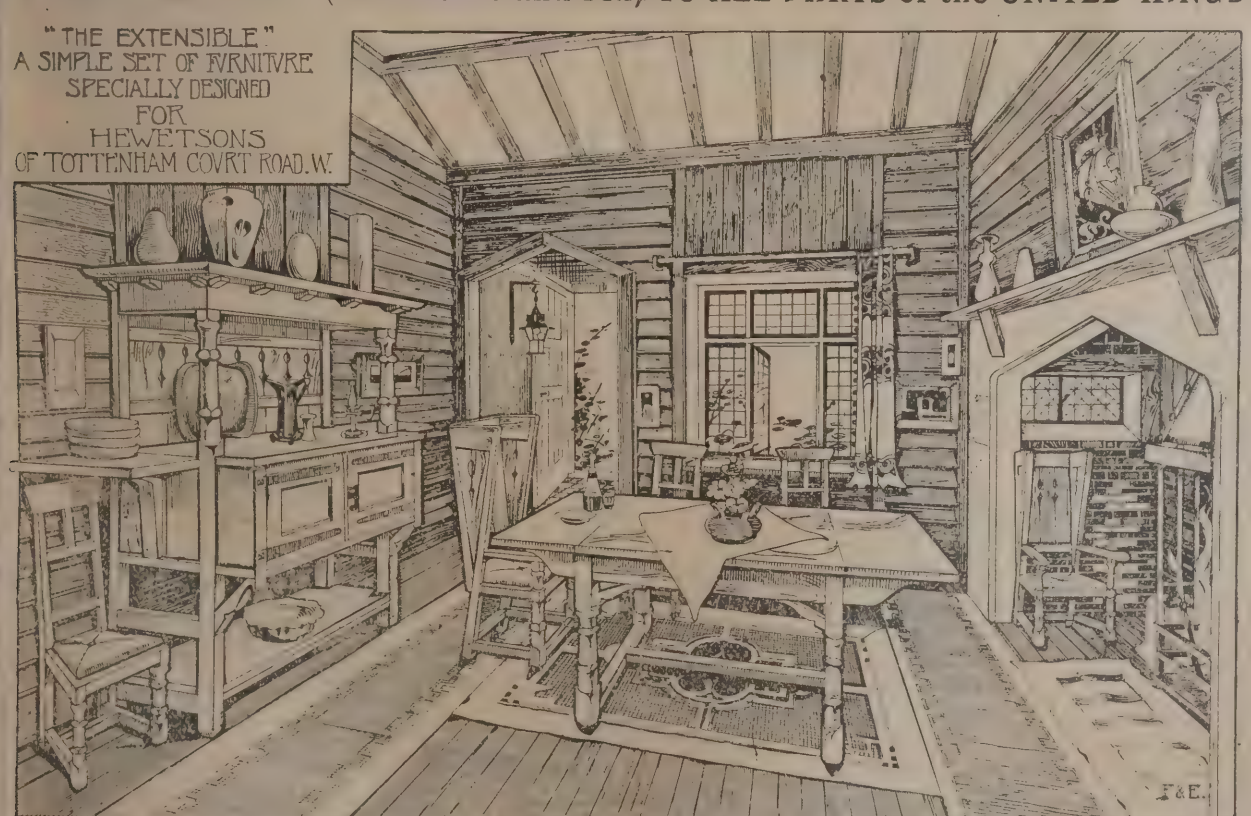
MESSRS. B. WARD & Co., of Great George Street, S.W., e just got out a pattern card of the latest designs in their f-keyed wood block floors, for which they claim that "they the cheapest in the market." The principle is certainly a ple one. No discs, disc-keys or wood or metal dowels are uired, as each block is keyed all round to the adjoining cks. They are made in all descriptions of wood, and the igns are pleasing and varied.

THE Shawlands Free Church Hall, at present in course of ction (Mr. J. Hamilton, architect, Glasgow), is being venti- d by means of Mackay's patent direct-acting invisible roof itilators, manufactured by the sole makers, Cousland & ckay, 150 Hope Street, Glasgow.

MESSRS. MAINZER & Co., LIMITED, have been entrusted h the carrying out of the mosaic floors at the Heath lum, Bexley, under Mr. G. T. Hine, the architect for the lding. The same firm have just completed the mosaic and azzo floors at the Whittingham Asylum, Lancashire, which been designed by Messrs. Simpson & Duckworth, archi- s, of Blackburn.

IN the ventilation of the Ballinasloe County Asylum, great ntion is being paid to the efficiency of the ventilation, which arried out by means of "Cousland's Improved Climax" nt direct-acting louvre ventilators of an ornamental design, by the "Climax" Ventilating and Heating Company, Limited, 93 Hope Street, Glasgow.

A LARGE clock has been erected in the parish church, Seighford, near Stafford, which chimes the quarters, strikes the hours and has two dials facing west and south. It is fitted with all modern improvements, and is guaranteed to keep accurate time. Messrs. John Smith & Sons, Midland Clock Works, Derby, have carried out the work. The same firm are making a large chiming clock for Swansea parish church.



MESSRS. WOOLISCROFT & SON, LIMITED, of Hanley, Staffs, are preparing an object lesson which they hope to have ready by the opening of the Building Trades Exhibition. It consists of the paving of a portion of the roadway in Upper Street, N., in close proximity to the Agricultural Hall, with their new paving bricks. These bricks, which are of the hard, red, pressed variety, are specially moulded and prepared, and have the upper edges bevelled. They are laid on a bed of sand some 1½ inches thick, which rests on a concrete foundation, and are united by a grouting of bitumen. This system of pavement obviously possesses many advantages, among which may be cited cheapness (its cost being about the lowest of any of the systems at present in use), its neatness, its cleanliness and its durability. Of the latter quality there can be no question in localities where the traffic is not unduly great, but whether it will stand the wear and tear of the heaviest description of town traffic has yet perhaps to be demonstrated; the mere fact, however, that Messrs. Wooliscroft & Son have chosen such a position as Upper Street, with its numerous 'buses and trams, for a demonstration is very positive evidence of their confidence in the new material.

ELECTRIC NOTES.

AN inquiry has been held at Grimsby by Mr. W. A. Ducat, Local Covernment Board inspector, into an application by the Town Council to borrow 43,500*l.* for electric-lighting purposes. The scheme met with approval.

THE latest and most remarkable outcome of Signor Marconi's demonstrations of his wireless telegraphic system is the proposal to connect London with New York by its means. It appears that the Wireless Telegraphy Company have been approached by the representative of a proposed syndicate which desires to acquire the sole rights of establishing wireless

telegraphic communication between England and America. It is stated that the proposal is made in all seriousness, and that there is every possibility of its being carried to a practical issue if the company and the syndicate can only come to terms. The directors of the company will consider the matter at their first meeting, which is fixed for an early date

VARIETIES.

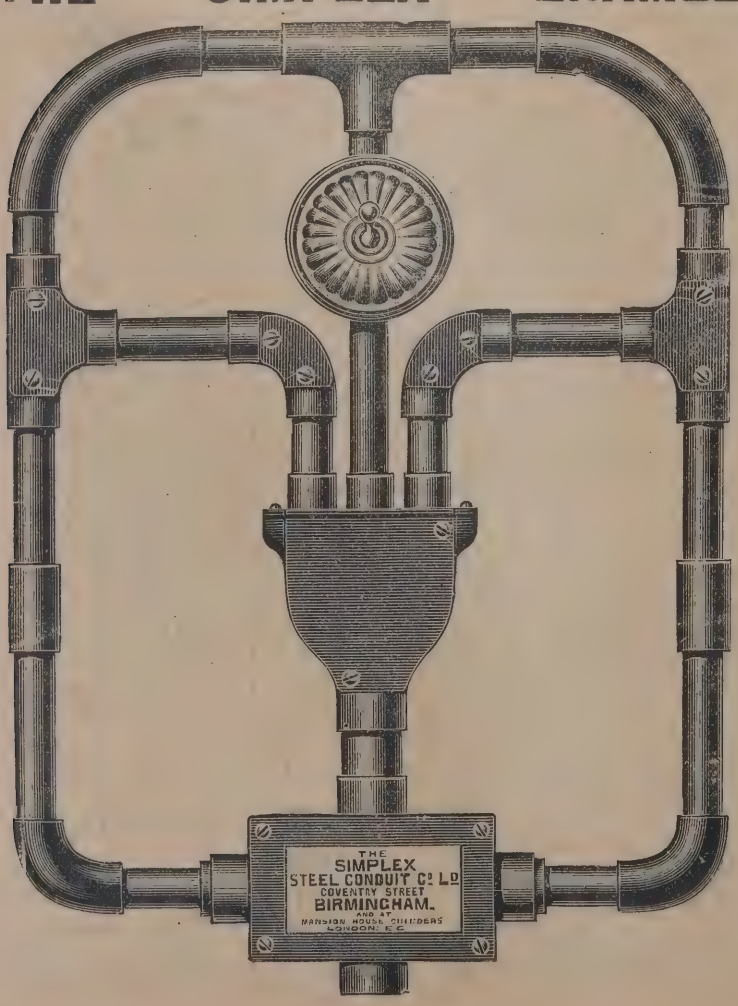
A new church which has been erected at Newport, near Hull, at a cost of 10,000*l.*, was consecrated by the Archbishop of York on Saturday.

The new addition which has recently been made to St. Mary's schools, Rathbone Road, Wavertree, Liverpool, was opened with a meeting of the parishioners and the children of the schools.

The London Geological Field Class, conducted by Professor H. G. Seeley, F.R.S., will commence their annual series of Saturday afternoon excursions on April 22. Full particulars can be obtained from the hon. sec., R. Herbert Bentley, 43 Gloucester Road, Brownswood Park, N.

Arrangements are being made by the Office of Works for the forthcoming visit of the Queen to the South Kensington Museum for the purpose of laying the foundation-stone of the new buildings which have been designed to replace the present unfinished structures. The ceremony, which will take place on May 17, will be a semi-State function, as was the case at the Imperial Institute. It will be performed in a large marquee, the site for which has now been cleared.

The student section of the Dundee Institute of Architecture completed their winter syllabus on Monday last, when they travelled to Edinburgh per saloon. Mr. T. Delgaty Dunn, Technical Institute, Dundee, conducted the party during the day over all the places of architectural importance, finishing up by spending a couple of hours in the Science and Art Museum. The outing was very much enjoyed by the members, who numbered over thirty.



Sir Edward Lawson may well be satisfied with the successful début made by the *Sunday Daily Telegraph* Whether regarded from a literary or from a business point of view, the new Sunday paper is an admirable example of what can be accomplished by liberality and well-directed energy, and it is a foregone conclusion that the new paper has come to stay.

Midford Castle, near Bath, where the sale this week of the effects of the late Marchesa di Sant Agata takes place, was built about 200 years ago. The castle is of singular construction, being triangular and in the form of the ace of clubs, the angles being rounded off and embattled. A Mr. Roebuck, a great gambler, is said to have built the mansion with the proceeds of a night's gambling, and by backing the run of luck of the club suit. It came into the possession of the old Catholic Conolly family 120 years ago, one of whom married Louis Brancaccio, the late owner.

The agricultural and horticultural committee of the Glasgow International Exhibition have accepted proposed plans and specifications from Messrs Spiers & Sons, engineers and builders, West Regent Street, for the erection within the grounds of the forthcoming exposition of a model farm-steading upon the latest and most approved principles. The plans show a pretty little place laid out in rustic style. There will be shown all manner of dairy work, and bee-keeping will also be practically illustrated. To the farmhouse proper it is proposed to attach a modern poultry farm, in which the different breeds of poultry and so forth will find a place. In addition to the usual dairy work—butter and cheese making—there are to be byres fitted up in the latest way, implement sheds, stables, harness-rooms and probably a model farm dwelling-house. Should the latter be found to be impracticable, a farm labourer's house will probably be substituted.

The annual meeting of the Worcester Architectural and Archæological Society was held on Monday at the Guildhall, Worcester, the Rev. J. B. Wilson presiding. The balance-sheet presented by the treasurer (Mr. J. Jeffrey) showed that the balance in hand of 55*l.* 14*s.* 3*d.* with which the year was commenced had been reduced to 52*l.* 1*s.* 5*d.* The balance-sheet was adopted, and the forty-third annual report, giving a *résumé* of the year's work, was read by the Rev. J. K. Floyer, joint hon. secretary with the Rev. H. Kingsford, and was duly adopted. The hon. secretaries, hon. treasurer and committee were re-elected. The Rev. R. R. Duke and the Rev. H. Kingsford were appointed delegates to the congress of archæological societies, and on the suggestion of the former gentleman, the Revs. R. R. Duke and J. K. Floyer, Professor Littledale and Mr. Jeffrey, were appointed a committee to conduct the work of restoring wayside crosses, which work has been very effectually commenced at Eckington. The summer excursions of the Society will this year be to Huddington and

Sudley and Wynchcombe. Earl Beauchamp wrote thanking Society for their congratulations and good wishes on his ointment.

Mr. Chas. Morton has certainly got together a splendid ipany for his matinée in aid of the National Lifeboat urday Fund, which will take place at the Palace Theatre on irsday, the 27th inst. It includes such popular favourites Mesdames Kate Rorke, Mary Rorke, Edna May, Ada ve, Marie Dainton, Ethel Haydon and Edith Courtney; Messrs. James Fernandez, Arthur Roberts, Herbert npbell, Eugene Stratton, Sydney Brooks, Fred Russell, rry Paulton, and others, and the programme promises to be ost attractive one.

BUILDING AND BUILDERS.

CASHIRE master builders, according to an official report, preparing for a general lock-out of their men to bring the ent plasterers' dispute to a settlement. In this action they supported by the Engineering Employers' Federation.

THE foundation-stone was laid on the 8th inst. of the Glade Club, Church Road, Tranmere, Cheshire. The club will ide a billiard-room with three tables, a large hall accomating 500 people, and at the rear a bowling-green, which be the largest in the district, measuring 51 yards by ards.

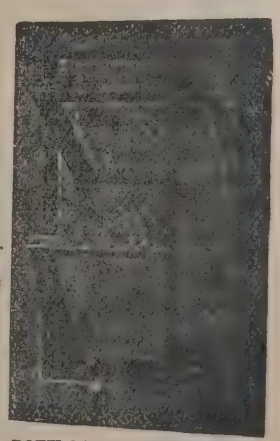
THE directors of the Glasgow and Renfrew District Rail- at a private meeting on the 6th inst., considered the ers that had been received for the different portions of their osed new line to Renfrew, and decided to place the con- for the construction of that portion of the railway begin- at Shieldhall, Govan, and terminating at Renfrew, with William Kennedy, contractor, Merkland Street, Partick.

THE master plasterers, who up to the present have been nised only by being federated through the Master Builders' ciation, have decided to have a national association of own, which while continuing to work in conjunction with the ers' organisation will pay attention to the interests of erers in particular. This decision was arrived at on the inst, at a meeting of about 100 delegates from all parts of ountry, held at Bradford. Mr. J. W. Sugden, of Bradford, elected first president. The present strike was subsetly discussed, and a communication forwarded to the onal Builders' Association.

A large derrick used in the construction of a bridge over the Harlem river, in 132nd Street, New York, overturned on Tuesday afternoon the workmen on it being thrown off. Three of them were killed outright and nine injured, while several others were drowned. Trustworthy reports place their number at ten, though the estimates vary from six to twelve.

Before Provost Stewart at Kirkintilloch Burgh Police Court on Monday a case of considerable interest to Scots builders was heard. Mr. Charles Murrie, joiner, was charged at the instance of the public prosecutor, under section 180 of the Burgh Police Act, with having, between March 18 and 28, permitted six dwelling-houses to be occupied before they had been certified as fit for habitation. The case occupied over two hours. For the defence it was sought to be proved that Mr. Murrie was not the person who should have been charged, as in the month of January he sold the houses to Mr. Charles Goodwin, who issued the permits granting entrance at March 1. The prosecutor held that, as Murrie had submitted the plans as proprietor, and notified the completion of the houses with a view to their being examined by the burgh surveyor, he was the party liable. The Provost found the charge proven, but in the circumstances, and in view of the scarcity of house accommodation in the burgh, he did not feel disposed to inflict a penalty, although he hoped the case would be taken as a warning by others. Mr. John Stevenson, on behalf of accused, intimated an appeal on the ground that he was not the person responsible for the letting of the houses.

NEW CATALOGUES.



We have just received from Messrs. Fleming, Birkby & Goodall, Limited, Halifax, a useful catalogue of their various manufactures, which include leather and indiarubber beltings, belt-fasteners, driving bands, driving ropes, belt plates and bolts, pickers and buffers, leathers and leather goods, fire fittings, suction and hydraulic hose, tubings and various rubber goods, telegraph and telephone appliances, &c. The book is tastefully got up, admirably printed on excellent paper, and is issued in an attractive cover.

A catalogue and samples are also to hand from the Patent Wood Carving Company, of Ilkeston Junction, Notts. The catalogue gives a large number of the designs in which the company produce mouldings, panels, &c., which can be supplied in oak, mahogany, satin wood, walnut, &c., and the

samples show that these designs work up sharply and produce an effective decoration, such as, if one may judge by the recent Furnishing Trades Exhibition, is now greatly in vogue.

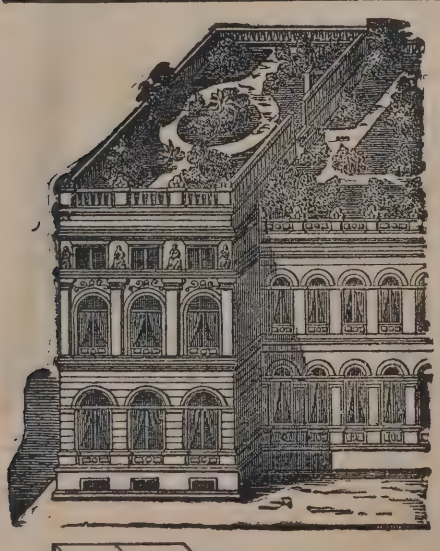
MESSRS. NEWTON, CHAMBERS & CO., LIMITED, of Thorncliffe Ironworks, Sheffield, are issuing a revised catalogue and price list of stable fittings, cowhouse fittings, and farm and garden requisites. They have been brought thoroughly up to date, and the former is confined exclusively to well executed illustrations of all the various fittings and appliances which go to the making of a thoroughly well constructed and perfectly appointed stable. The reputation of the firm is such that it is needless to enlarge upon the excellence of the goods supplied by them, while sticklers for "the latest thing out" have only to turn over the numerous pages of this catalogue in order to find the newest and most recently improved models in the various goods carefully delineated.

MESSRS. COUSLAND & MACKAY'S (of Clyde Place, Glasgow) catalogue will be found a very useful epitome of their latest forms of ventilating appliances, many of which are figured in well-drawn and clearly printed illustrations. Among these sketches we may mention a section showing the method of applying the firm's various specialties to a building; the recent "Mackay" patent improvements on the invisible roof ventilator and ridge ventilators; specially designed ventilators for prevention of down-draught; patent valve-box for the same purpose, with removable valve-trays; a recently introduced specialty in ceiling extractors, in which the "underfloor" ventilator fits in between the ceiling and the floor above, between parallel joists, providing an efficient and inexpensive means of ventilator. These ventilators are fitted with specially designed patent valves to insure protection against an inrush of cold air. Messrs. Cousland & Mackay have also produced a number of new and artistic designs at moderately low prices in turret, louvre and ridge ventilators, as well as in other specialties.

WORKMEN'S COMPENSATION ACT.

AT Southwark County Court, on the 11th inst., before Judge Addison, Q.C., William Robert Brown, a bricklayer's labourer, sued Mr. H. W. Brown, a builder and contractor, of Albert Road, Dalston, to recover 200*l.*, under the Workmen's Compensation Act, for injuries sustained. Mr. W. M. Thompson, barrister, who appeared for the plaintiff, said that on November 14 last his client, who was at work for the defendant, was ordered by a foreman to place a board in front of a steam exhaust pipe. After he had done so plaintiff was about to descend from the roof, when he became enveloped in steam, with the result that he stepped through an unguarded skylight. He fell a distance of 24 feet and injured both legs in such a manner that one would probably have to be amputated. Mr. Thompson contended that the accident happened as the result of a negligent order by the foreman. His Honour gave judgment for the plaintiff for 100*l.* and costs.

GLASS BLOCKS FOR PAVEMENTS AND WALLS.



THE United States Consul at Lyons has sent to the American Bureau of Foreign Commerce a report on new uses of glass. He says:—

Early in October 1898 a paving company of this city began laying on the Rue de la République a piece of pavement of ceramo-crystal, ceramic stone or devitrified glass. During the months of November and December of 1898, and thus far in January 1899 this pavement has been driven over during all hours of the day and night. It has stood as hard usage as any pavement could be subjected to during that time, and is still in an admirable state of preservation.

The glass or ceramic stone pavement is laid in the form of blocks, 8 inches square, each block containing sixteen parts in the form of checkers. These blocks are so closely fitted together that water cannot pass between them, and the whole pavement looks like one large checkerboard. Like all thoroughfares in France, the roadbed slopes gently to the walk on each side. Some of the edges of the checkers have been broken during their three months' service. I counted twenty of the blocks that have been slightly chipped on the edges. It is contended, and I think with justice, that this does not argue against the value of the material as a pavement, and that any kind of stone would have suffered just as much or more in the same time.

I visited the Ceramo-Crystal Manufacturing Company's works yesterday, at the suburban village of Demi-Lune, about six miles from Lyons. The factories cover nearly 8,000 square yards of ground. Work is now stopped in them while additions are being made to the buildings in the shape of second stories. In the yards are many tons of broken bottles, which the superintendent told me was their "raw material." On the fa

PATENT
VULCANITE ROOFIN

Since the introduction of the patent Vulcanite Roofing into this country it has been by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and than under any other roof. When properly laid repairs are never required, and all guaranteed. The roof-surface can be used as a garden, or for any other purpose. T construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, B TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width inches, being more convenient than the usual damp-course slabs, and saving laps. Price quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., SARKING under slates or tiles, manufactured in five different qualities and in rolls of ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and r annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

s of a large brick smoke-stack are specimens of ceramo-
tal for buildings and interior decoration, some of the pieces
mooth as highly-polished marble, others being rough, like
stone, and still others having a surface like common brick.
The advantages attributed to this ceramo-crystal by the
ufacturers are—as a pavement, it has a greater resistance
n stone; it is a poor conductor of cold, and ice will not
n upon it readily; dirt will not accumulate upon it as easily
pon stone, and it will not retain microbes; it is more
ble than stone and just as cheap.
The Central Architectural Society of France made a report
ntly on this ceramic stone, of which I give a brief synopsis.
officer of the society reported that he had examined a
re, suitable as a pavement or floor for a stable, a court-
or factory; a block imitating polished marble; a block
ting mosaic; and a panel with moulding or ornamenta-

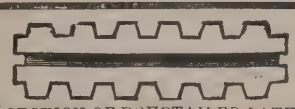
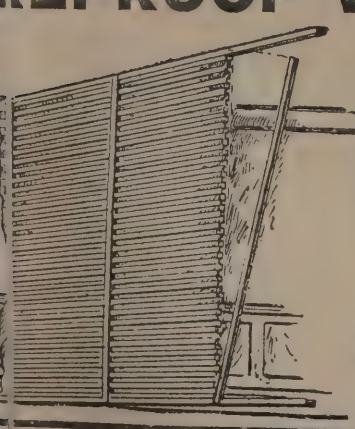
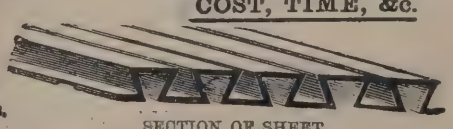
purposes. On careful examination it is found that the
hey ceramic stone is nothing but glass brought to a
al molecular condition. In a certain sense it constitutes
v substance, which resembles flagstone, granite or marble.
manufacturer assures us that with this material he can
any model that is presented.
his new product is obtained from broken glass heated to a
erature of 1,250 degrees and compressed in matrices by
ulic force. The physical transformation of glass is due
vitrification under the Garchey process. The phenomenon
vitrification produces a sort of dissolution more apparent
real; for, upon chemical analysis, the devitrified glass
rves the identical composition of natural glass.
may be said, then, that devitrified glass possesses all the
sic qualities (physical and chemical) of glass except the
parency, while taking on an entirely different aspect.
ermore, glass treated under this new method is made to
crushing, frost and heavy shocks, and to stand usage.
his subject is being discussed in the press, and is receiving
al consideration. An elaborate and exhaustive article in
Revue des Deux Mondes for November treated the
ion under the heading "A Glass House," the writer
ing that a large house constructed entirely of glass would
attractive feature of the coming World's Exposition in
He said that glass could be used for tubes, pipes, vats,
smoke-stacks for factories and for buildings. Double
glass walls in a house would admit of the circulation between them of cold or warm air, thus regulating the temperature. "As to the resistance of such a structure, it would certainly be equal to that of the most solid houses of the day . . . and it is lighter and less expensive than brick. The Garchey glass-stone had hardly come into existence before a method of using it, both simple and inexpensive, was revealed by the device of the American inventor Golding."

The glass house, or the luminous palace, which it has been decided to build on the grounds of the 1900 Exposition, parts of which are now being constructed, is thus described by the writer last quoted:—

The principal façade, in the form of an immense portico, its roof surmounted with spires and with a winged statue representing Light, will be supported by heavy columns. The ground floor, reached by a double flight of stairs, will be used as a great exposition-room. To the right and left will be large glass basins, overhung by grottos of glass. In the interior of the hall will be five large openings, in which will be represented the five divisions of the globe.







ILLICIT COMMISSIONS.

THE subject of the discussion after the monthly dinner of the London Chamber of Commerce, on the 11th inst., was "Secret Commissions, Rings and Corners." Sir Edward Fry presided, and in the course of his address said:—

I pass from corners and rings to the subject of secret commissions. There, I think, we are all agreed, because the report which was presented by the committee on the subject appointed by your Chamber of Commerce has, as I understand, received the sanction of the council of the Chamber. Therefore it appears to be the judgment, the conclusion, of the body of men in this City most competent of all others to express an opinion upon this most important subject. Now what is the conclusion expressed by that most competent body of men on this subject? It is that secret, and therefore I will say corrupt, commissions in various forms are prevalent in almost all trades and professions, that in some of them they have increased and are increasing, and that the existence of this system of secret commissions is prejudicial to the community. That is a most important point. It is one which, as far as I have been able to observe, has passed unchallenged. I do not observe that any

of THE ARCHITECT. Handsomely Bound in Cloth, Price 12s. 6d. Office—Imperial Buildings, Ludgate Circus, E.C.

one has come forward to say that the conclusion of the Chamber of Commerce or the evidence on which they have come to that conclusion is inaccurate or in any way open to challenge. I therefore take it that we have the judgment of the commercial community of the City of London upon that most important question concerning the existence of this great evil.

The Misery Caused by the System.

I have had a very considerable correspondence on the subject, and I must say that one aspect of it impresses me very much; it is the misery which this system causes to a great many people. I am not speaking of the way this evil undermines the security which man ought to feel in dealing with man or of the way in which it interferes with honest trade and honest enterprise, but of the misery which it causes to individual men, who, perhaps brought up in awe of anything that is dishonest, find themselves in an atmosphere where such prejudices are common, and where they feel almost compelled to follow the example. I have in my possession letters from people telling me of their experiences—letters of the most affecting description. I therefore appeal to you to bestir yourselves in this matter, not only on the ground of the vast injury it entails on commerce, but on the ground of the misery it causes to honest and honourable men.

The Proposed Legislation.

As you are aware, the Lord Chief Justice is about to bring into the House of Lords a Bill upon this subject, of which I will only say this—that you will find that the lines of that Bill follow the lines laid down in the report presented to you by your committee. I am very anxious to impress this point on you—that it is highly important that we should not rely too much upon that Bill by itself. I am by no means one of those who agree with the observation that you cannot make people honest by Act of Parliament. In one sense that observation is true, but it is generally used in an untrue sense. It is not true that you cannot help men to be honest by Act of Parliament. It is not true that laws have no influence on the morals of men. It is quite true that you may have an Act of Parliament which falls into desuetude and is worthless, but it is equally true that we owe a great deal to the admirable character of our legislation. I do not for a moment deprecate the value of statutory enactments on this subject. It appears to me that there is a branch of legislation which can encourage us in this respect—I refer to the legislation addressed to the subject of corruption in electoral matters. I think no one whose recollection goes ba can doubt that there is a vast improvement in that respect that corruption in electoral proceedings and elections, bo municipal and Parliamentary, was viewed with much great leniency some years ago than it is now. I think it is impo sible to doubt that the improved condition in that respect h been due to the legislation which has taken place, and we ha perhaps in that legislation as nearly a parallel case to this pr posed legislation against corrupt commissions and bribes as w can expect. While I would have you support the Lord Ch Justice in his proposed measure, what I am very anxious impress upon you is that it should not be supposed for o moment that, even if the Bill passed into an Act, the whc work is done. In order that the legislation may be effectiv it must be supported by your zealous concurrence.

What may be done without Legislation.

If that Bill never becomes an Act, there is much that y can do without it. You may apply yourselves to informi those in your employment, watching those specially subject the temptation of these bribes, keeping a more vigilant e where these bribes are administered, and also impressing o those you employ when you engage them the necessity abstaining from taking such bribes. Therefore quite ind pendently of legislation much may be done, but without yo help legislation will do little. Therefore I say that, wheth the Bill passes or does not pass, much may be done by t community, especially the commercial community, of Engla in checking the great abuse which has been pointed out. will only say further that I think it is highly important th some vigorous action should now be taken. It seems to r that you can never be in the same position that you were before. Before there was a general but vague impression th these bribes existed. Some people knew with more exactitu than others of their existence. Some did not know abo them—like my friend on my left (Mr. Margetts). But y have investigated the subject, and have found the existence the evil and the greatness, and therefore you can never be the same position that you were in before. You are like a s man whose physician has diagnosed his disease and told h of it, and you must therefore make an effort to get well, continue to languish as a miserable and hopeless invalid.

The Report of the Chamber of Commerce.

I say, therefore, that this report of your Chamber puts matter of illicit commissions on a new standpoint, and

TO ARCHITECTS, SURVEYORS, &

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator,
CHING'S New Patent Silent Chimney Breast Ventilator

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM

requires now more than ever that a zealous effort should be made by this great community of London to stop this evil. You have taken the lead; you have had a report which certainly confirms the suspicions of those who had suspicions before. You acknowledge the evil, and I venture to say that it is your duty to try and crush it. I repeat that it appears to me that we must not trust too much to legislation. I am very glad that this should be the subject of legislation, but you know what it is when legislation stands alone—when it is not supported by those whose duty it is to zealously support it. The law then falls dead, and the question which is so often asked would again have to be answered in an unfortunate way if you were not to avail yourselves of this opportunity to put an end to it.

IMPROVEMENTS AND WORKS IN THE CITY.

The City engineer (Mr. D. J. Ross), in his annual report to the Corporation, states that the length of new sewers constructed during the year was 137 feet, and the number of houses drained 176. Negotiations had been continued to acquire the various interests in the premises required for the widening of the southern side of Fleet Street. Several claims had been settled, and one frontage set back to the new line. The remaining claims were ready for settlement. The premises, 19 and 20 Fleet Street, nearly opposite St. Dunstan's Church, being about to be rebuilt, a favourable opportunity occurred for widening Fleet Street at its western end, and the London County Council had agreed to contribute 20,000*l.* towards the cost, which the Corporation had accepted. The improvement at the western end of Cheapside had occupied attention, and many interests had been acquired. All remaining claims were under negotiation. Preparations had been made for completing the Basinghall Street improvement, commenced as far back as 1861. With regard to the widening of Lower Thames Street, between Fish Street Hill and Monument Street, for which an application was made in 1897 to the London County Council for a contribution towards the cost, no reply had yet been received. The question of making an improvement by opening a passage-way between Drapers' Gardens and Copthall Buildings had been before the court for a considerable time, but owing to legal difficulties no progress had been made, and until those difficulties had been removed the matter remained in abeyance. The London County Council had declined to contribute to the widening of London Wall on the ground that as the land in Finsbury Circus, &c., having realised a higher price than it would have otherwise fetched owing to the intended widening, the Corporation were not entitled to compensation. With regard to the large area destroyed by the great fire in Cripplegate, when 3½ acres were demolished, the Corporation gave great attention to the question of effecting improvements. Many schemes and estimates for widening the existing thoroughfares and for forming new streets were prepared, but the London County Council had declined to contribute towards any of them. Failing in obtaining any contribution from the London County Council, the Corporation, considering that any improvement, if carried out, would be of a metropolitan and not a local nature, did not feel justified in proceeding by themselves. The result had been that the properties on the site had been rebuilt on the old lines of frontage, and no improvement effected. An arrangement had been made for widening Lothbury off the south side between Princes Street and the Old Jewry. The London County Council had agreed to contribute one-third of the cost of making the street 50 feet wide. The Corporation were forming a new street between Fenchurch Street and Crutched Friars, 40 feet wide, the owner of the land paying 6,000*l.* towards the cost, and on the invitation of the London County Council were contributing one-half the cost of widening Mansell Street, one of the direct approaches to the Tower Bridge. The price paid to the Gas Light and Coke Company for public lighting had been 2*s.* 3*d.* per 1,000 cubic feet. As regarded the electric light, 502 arc lamps were being used, but the question of lighting the side streets by electricity was still under consideration. The number of defective lamps observed was 886, for which the company was fined in each case. The cost of the water for flushing sewers, street watering and other public purposes was 3,736*l.* Beneath the City streets were 2,392 yards of subways. The lengths of gas, water and hydraulic mains, and telegraph, pneumatic tubes, and electric-lighting conduits laid in them amounted to nearly 10½ miles. The electric-light and telegraph conduits contained about 440 miles of wires and cables. The work of the Corporation in regard to street cleansing was important, conceiving that over a million people and nearly 100,000 carriages entered and left the City, and over 300,000 passed the day within the City. The quantity of water used for washing the streets was 26,000,000 gallons. The refuse removed amounted to 73,705 van loads. At the City Cemetery, at Ilford, 4,752 interments

took place. The fire hydrants in the City were 831 in number, and were in proper working order. On the application of the Drinking Fountain Association, the whole of the cattle troughs and drinking fountains belonging to them within the City were transferred to the Corporation, who had undertaken to maintain them.

PROPOSED ZOOLOGICAL GARDEN FOR EDINBURGH.

A REPORT has been prepared by the committee appointed at a recent meeting to examine sites for the proposed zoological garden for Edinburgh. The committee have visited and carefully examined a number of sites in and near Edinburgh which they considered might be found suitable for a zoological garden. The following is a list of these, with the approximate feu-duties which the committee were informed would be demanded:—

1. *Redbraes Nurseries.*—This ground belongs to the Corporation of Edinburgh, and is situated in the Broughton Road, and adjoins the refuse destructor. It consists of about 10 acres, and includes a small mansion house and a pond. The committee was unable to obtain definite information as to the feu-duty, but even if this were very moderate, it is thought that the ground would be entirely unsuitable for the object in view. A large number of public works are in close proximity, and the health of the animals would be sure to suffer from the vitiated atmosphere. It would take a very large sum to put the grounds in order.

2. *Ground at the Dean.*—The Corporation possesses a large number of acres of ground on the north side of the Queensferry Road. This ground, while in close proximity to the city, slopes towards the north, and is quite bare of trees. The committee could not get definite information as to the rate of feu-duty, but from the fact that the Corporation recently refused 90*l.* per acre per annum for ground in the vicinity, it is probable that the feu-duty expected would be so high as to be prohibitive.

3. *Ground at Warriston.*—There are about 15 acres of fine ground situated to the north of Warriston Cemetery, belonging to George Heriot's Trust. This area is in close proximity to the car line running to Goldenacre. The nearest railway station at present is on the Caledonian line at Granton Road. This ground was offered to the Warriston Cemetery Company some time ago at a feu-duty of 65*l.* per annum, but was refused.

4. *Ground at Betlevue.*—This ground also belongs to the Heriot Trust, and is situated near the spot where the old zoological garden existed. It extends to only a few acres, and the smallest feu-duty which has been charged for ground here is 120*l.* per acre per annum.

5. *Hawkhill Recreation Grounds.*—This ground is situated in Lochend Road, Leith, and extends to about 13 acres. The price expected is not less than 16,000*l.*

6. *Grounds of Restalrig House.*—These grounds enter from the Restalrig Road, and are abundantly supplied with trees. There is also a large mansion-house. They are somewhat inaccessible to Edinburgh people, and can only be approached by the car to Portobello and from Piershill station on the Portobello line. The price would probably be much the same as Hawkhill.

7. *Joppa.*—There is a large number of acres of ground at the east end of Joppa, and within easy reach of both Joppa station and the tramway. The ground is much exposed, but is in very close proximity to the sea, and would thus be valuable for a marine biological station and aquarium. There are a large number of holiday visitors to Portobello and Joppa from Glasgow and other cities, in addition to those from Edinburgh. The feu-duty would probably be about 35*l.* per acre per annum.

8. *Comiston Estate.*—Sir James Forrest, of Comiston, is agreeable to feu 10 to 15 acres for a zoological garden at a feu-duty of 35*l.* per acre per annum. The ground seems fairly suitable, and the Braid Burn which runs through the ground would be of great advantage for watering the animals.

9. *Barton Estate.*—The proprietrix of this estate is willing to feu 15 or 16 acres of ground for the proposed garden at the rate of 12*l.* per acre per annum. The sub-committee visited the estate, and were generally much impressed with the suitability of the ground which was pointed out to them. It lies a little to the north of the Queensferry Road, and is bounded on the north by the Caledonian Railway to Barnton. Barnton Gate station is within a few minutes walk of the site. The main drawback to this ground is its distance from the city.

The sub-committee also made inquiries as to ground at Craiglockhart, Prestonfield and the Hermitage of Braid, but it was found that the proprietors of these estates were disinclined to feu for a zoological garden, principally on the ground that, as they think, the amenity would be injured. The sub-committee were not satisfied with the entire suitableness of any of these areas of ground. The three requisites most to be

desired are proximity to population, amenity for an attractive garden and price. The ground at Barnton is, in the opinion of some members, by far the most desirable; it possesses great amenity and is reasonable in price, but the committee hesitate to recommend the formation of a zoological garden at a distance of three miles from the city, even although the railway facilities would be excellent. So far your sub-committee have exhausted their remit. Wherever the proposal for a zoological garden has been discussed it has been welcomed in the most cordial way as a real municipal and national gain, a much-felt want, and a scheme to be encouraged by public support. It appears to some of the sub-committee that the most feasible of all the sites would be a portion of the Arboretum, and they submit it might be worth consideration whether or not a movement should be made to acquire from the Government, on terms and conditions which could surely be adjusted, a sufficient area at Inverleith, and this would possess all the qualifications to make the garden a success.

THE PLASTERERS' DISPUTE.

A CONFERENCE between the National Association of Master Builders and the National Association of Operative Plasterers has been held at the offices, Bedford Street, Strand. The employers were represented by Mr. W. Houldsworth (Huddersfield), who presided; Mr. R. Neill (Manchester), Mr. T. F. Rider (London), Mr. B. J. Greenwood (London), Mr. J. Bowen (Birmingham), Mr. W. Symonds (Cardiff), Mr. W. Lowry (Newcastle-on-Tyne), Mr. W. Nicholson (Leeds), Mr. J. Higson (Manchester), Mr. W. Blake (Plymouth), Mr. G. Nicholls (Leicester), and Mr. John Rule (Sunderland). The points to be discussed were set forth in the masters' circular of February 1 last. In this the masters said that it was quite obvious that unless the master builders were prepared to surrender their right to direct and control their own business, prompt and effective measures must be taken to check the increasingly aggressive policy of the operative plasterers. The operative plasterers had assumed an attitude towards the masters beyond endurance, and it was, therefore, proposed that the master builders' associations throughout the kingdom should simultaneously require from the National Association of Operative Plasterers an official assurance that the following objectionable practices should cease forthwith:—(*a*) The present attempt to coerce foremen of plasterers or superintendents of plasterers' work into the membership of the National Association of Operative Plasterers; also (*b*) the threat to withdraw all members from the building firms employing such foremen or superintendents; (*c*) the practice of boycotting certain building firms and employers of plasterers, in spite of the fact that such firms adhere to the rules agreed between the Master Builders' Association and the National Association of Operative Plasterers; (*d*) the practice of printing and circulating amongst the members of the National Association of Operative Plasterers a list of such firms for whom they are forbidden, under penalty, to work; (*e*) the refusal to work on buildings where some of the workmen employed may not belong to a trades union; (*f*) the refusal to accept the decision of the employers as to which workmen shall do certain work in cases where the plasterers dispute with other trades as to their right to do such work; (*g*) the practice of withdrawing all their members when such work may not be placed in the plasterers' hands; (*h*) the objection to submit all trade disputes to discussion at a conference between employers and employed, with a view to arrive at an amicable settlement prior to any strike or withdrawal of workmen. The masters added that none of these demands were in any way antagonistic to the legitimate action of trades unions, and that they involved nothing but that to which employers of labour were reasonably entitled. After considerable correspondence the masters wrote asking the men to say definitely whether they persisted in coercing any men into their union, and, if so, what men. To this Mr. Deller, on behalf of the men, replied:—"We have not any desire, neither have we ever had any desire, to coerce anyone into our association. We claim the right and privilege to persuade any plasterer working at the trade to become a member."

The conference was held with closed doors. The delegates assembled at 2.30, and after some considerable discussion, as there appeared to be a deadlock, the masters retired, and agreed to put four questions to the men in writing, to which answers were also to be given in writing. The questions and answers are as follows:—

1. Are you properly authorised to definitely agree to and sign any agreement we may arrive at with reference to the employers' circular of February 1?—Yes.

2. It must be understood that an agreement shall be applicable to the whole of the country?—Agreed.

3. Are you prepared to enter into a monetary guarantee on

both sides for the faithful observance of any agreement arrived at?—We cannot agree to a monetary guarantee.

4. In your letter of March 24 you state that you have no desire to coerce anyone into your association, and claim the right to persuade only. Do you confirm or withdraw that statement?—We wish to be honest with you, therefore withdraw the word persuade only, as we could not guarantee that our members would agree to such action on our part.

This is the official statement as supplied to the Press:—With reference to the last answer, which appears ambiguous, the secretary to the masters stated that it was understood that the men withdrew the word "persuade," but refuse to withdraw the right to coerce.

The masters and men then reassembled, and discussed the matter for another hour. The conference having lasted two-and-a-half hours the delegates left the room, and the secretary handed the following official statement to the Press:—"A general discussion took place with reference to the various objectionable practices set forth in the masters' manifesto, but virtually no progress was made, for on the first point, *re* coercion of foremen plasterers, the men's representatives not only refused to abandon the practice, but deliberately withdrew the assurance given in their letter of March 24 that they had no desire to coerce anyone into their association, but claimed the right to persuade only." After further discussion the employers then explained that it was the assurance in the plasterers' letter of March 24 that induced them to accede to the men's request for a conference, and that as that assurance had been withdrawn the employers must decline to continue the conference.

As the masters have declined to confer with the men until this point is cleared up it consequently remains for the men to make the next move.

Mr. Deller, the secretary of the Plasterers' Union, when seen by a reporter, said:—"The conference broke down simply because we refused to give a guarantee to coerce our members to work with non-unionist plasterers. The question put to us was whether we would be prepared to coerce our members to work with non-union men. We refused because we cannot bind any member to work with a non-union man if he is not willing."

One of the employers said to the same reporter, "The fact of the matter is the men are not ready for a conference. The time won't be ripe for a conference until they feel our (the masters') power."

SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers, held at the Roy United Service Institution, Whitehall, on Monday evenir April 10, Mr. John C. Fell, president, in the chair, a pap was read on "Machine Tools," by Mr. Ewart C. Am M.I.Mech.E. In his opening remarks the author pointed c the importance of engineers being well acquainted with t most modern practice in regard to the construction of machi tools. He further added that, owing to the important part n played by machinery in the world, the progress of this coun in relation to others would be largely determined by capacity to turn out the best and most improved tools. T author then referred to the distinctive features of modern too directing particular attention to the fact that it had n become the practice to substitute for one machine doing great variety of work a number of machines, each dealing w one class of article. Modern practice also called for grea accuracy and more automatic machinery.

He observed that ball thrust, hollow spindles, cut-tooth gear and other refinements had now become very general, a resulted in the production of better work at less cost. He th divided his subject into a series of headings, which includ amongst others lathes, drilling, boring, milling, planir shaping, slotting, keyway-cutting, punching and shearing, pla bending, metal sawing and forging, and welding machine Under the lathe section, descriptions were given of son powerful machines by Sir William Armstrong, Whitworth Co., Limited, including a 20-foot faceplate break lathe weighir 178 tons, also a special lathe for boring out and chambering gun The author also devoted considerable space to a description various forms of capstan lathes with wire feeds and chasin apparatus, pointing out what an important tool this ha become. Of drilling machines several useful types we described and illustrated, including a semi-radial drill American design, which is of entirely novel construction. T author's reference to milling machines indicated the impor ance he attaches to this class of tool, which is now in so mu demand in all well-appointed shops, and is made in such variety of shapes. A number of other tools under the headin enumerated were also described, and in most cases illustrate

The author then described several hydraulic power machine and under another heading gave a description of a class of to now coming very much to the front, viz. the pneumatic. Son useful information was given as to their advantages ar

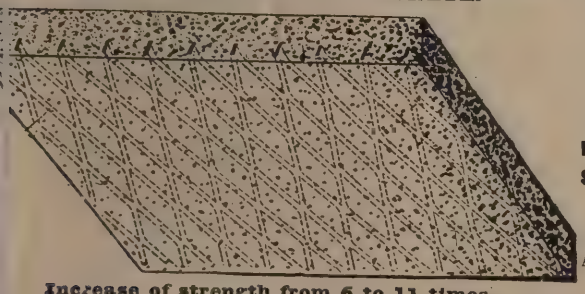
Messrs. W. B. SIMPSON & SONS, 97 & 99 St. Martin's Lane, W.C.

conomy. Some figures and data given in this connection owed that in drilling four times as much could be done as mpared with hand drilling, and that they effected a saving some 50*l.* to 75*l.* per annum per tool, even in a comparavely small drill. A working size pneumatic hammer was chibited. The last two divisions, viz. British *v.* American ols and good *v.* cheap tools, were as interesting as any, and forded considerable scope for the discussion which followed e reading of the paper.



Under the British *v.* American heading the author closely mpared the two makes, and whilst he said he felt bound to ve considerable credit to American manufacturers for their genious and well-thought-out designs and well-finished achines, he also considered that the home products would obably excel them if our manufacturers could see their way discard some of their old patterns. The author concluded is section by pointing out that although our markets were ready encroached upon by the American makers, yet the ospect of a largely increased demand for machinery in the ar future would tend to provide business for makers of both untries, securing at the same time a healthy competition. nder the heading of cheap *v.* good tools the author expressed mself very strongly in favour of good tools, and showed that ey were, in the long run, cheaper than the so-called cheap ols, although higher in the first cost.

THE NEW GLASGOW BRIDGE.

OR more than three years, says the *Scotsman*, operations ve been going on in connection with the rebuilding of asgow Bridge, and as it is now approaching completion it ay be of some interest to give a general description of the rk. There has been a bridge over the Clyde at the oomielaw for some centuries, but the oldest one of which y authentic drawings exist is one which was removed about 35 to make way for the bridge which was built at that time m the designs of Telford. That old bridge was one of six ne arches of unequal spans, with a steep incline from both nks towards the centre of the river. As originally built it s only about 22 feet wide, but this was subsequently increased about 35 feet by the erection of cast-iron girders outside the asonry arches. Telford's bridge, which was an immense provement on the old bridge, consisted of seven stone ches, the spans increasing from 52 feet at the abutments to 59 feet at the centre. The width between the parapets was 58 feet, and the approaches were on a much easier gradient than those of the bridge which it superseded. It is the common belief that Telford's bridge was constructed of granite, but as a matter of fact it had only two granite faces, and the whole of the rest of the bridge was of sandstone. Sixty years was a short life for such a structure, but Telford had but little idea of the enterprise of the Clyde Trustees. When he built the bridge it was almost possible to wade across the Clyde at the Broomielaw at very low water, and when he put in his foundations about 9 feet below low water, on a timber platform supported on piles, he no doubt thought that he was quite safe for at least 100 years, if not for all time. The operations of the Clyde Trust during the last thirty years have, however, changed all this, and for many years the foundations of the piers were practically condemned, and had to be protected with mounds of rubble and concrete, which formed an insecure protection at the best, and seriously impeded the navigation of the upper reaches of the river. Although not much subsidence could be observed in the structure of the bridge, the arches were seriously rent, and it became quite apparent some years ago that Telford's bridge was doomed. The Town Council of Glasgow took up the matter in earnest in 1892, when they obtained an Act of Parliament to enable them to remove the bridge and to erect a new one in its place, but much had to be done before the scheme could be carried out. A temporary bridge had to be erected to carry the enormous traffic which passes over the river at the place, and this was done at the cost of about 13,000*l.*, the piers being of piles strongly bound together, and the spans being formed of steel girders, bound with two layers of planking, on which the causeway and tramways were laid. This temporary bridge was of the same width as the old bridge, and has answered its purpose admirably for the past six years.

For various reasons it was resolved to build the new bridge practically with the same elevation as the old bridge, one reason being that the granite piers could be redressed and replaced on the new bridge, but as a matter of fact the whole of the new bridge is of granite, the arches being of granite throughout and the piers faced with the same stone. The most difficult and most expensive part of the work was in obtaining a proper foundation, and as all the piers and the abutments have been carried down to a depth of about 60 feet below low-water level, and from 20 to 30 feet below the founda-

THE PROBLEM SOLVED.
ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.
THE BRITISH NON-FLAMMABLE WOOD COMPANY, LTD., who have recently introduced into Europe the process now being so largely used in America, have erected large works in this country, and are now taking orders for the supply of their NON-FLAMMABLE WOOD. PRICE LIST AND ESTIMATES ON APPLICATION

tions of the quay walls along the Clyde, one can hardly imagine that any possible future operations of the Clyde Trustees will in any way interfere with the stability of the new bridge. The foundations were sunk under pneumatic pressure by means of steel cylinders, having an air-tight chamber at the bottom, in which the workmen dug out the excavations, while the cylinders were sunk by being gradually filled up with concrete, the superincumbent weight forcing the cylinders down as the excavations were removed. Each pier is supported by four cylinders, each 15 feet diameter, these being connected with each other at low-water level by semicircular granite arches, on which are built the solid piers which support the main arches. The abutments and wings are also supported by cylinders, those for the abutments being similar to those for the piers, but those for the wings being considerably smaller and being built of brickwork instead of steel and concrete. One of the main features of the new bridge will undoubtedly be the parapets, which are of polished granite throughout. The old parapets were of rather a handsome design, consisting of moulded balusters supporting a moulded cope. Although these were all of grey Aberdeenshire granite they had, in course of time, become so ingrained with dirt as to be quite black, and it was almost impossible to recognise the nature of the stone of which they were made. Almost the whole of these balusters and copestones were found to be perfectly sound, and now that they are redressed and polished they add a most imposing feature to the structure, while they can be kept perfectly clean for all time by a judicious application of an ordinary street hose. The pediments surmounting the piers of the old bridge were rather insignificant, and served merely as bases for gas lamps. These have been superseded by elaborate moulded and polished granite pediments rising considerably above the level of the parapets of the arches. No provision has been made on them for lamps, as the whole lighting of the bridge is to be carried out by means of a row of electric lamps placed along the centre of the carriageway. The new bridge is 80 feet wide between the parapets. The footpaths on either side are 15 feet wide and the carriageway 50 feet. A double line of tramway occupies the centre, and there is on each side ample room for a double line of ordinary street traffic between the tramway rails and the kerb. Provision has been made on the bridge for a large number of pipes, including two 27-inch water-pipes, two 24-inch gas-pipes and a whole array of smaller pipes connected with the hydraulic pressure, electric lighting, electric traction, telegraphs and telephones. The bridge will be opened for traffic during the summer, but the precise date has not yet been fixed. The engineers of the bridge are Messrs. Blyth & Westland, M.M.Inst.C.E., Edinburgh, the contractors are Messrs. Morrison & Mason, Glasgow, and the whole of the new granite has been supplied by Mr. John Fyfe, Aberdeen. It may be of interest to mention that the granite in the old bridge also came from Aberdeen, the builders of it being Messrs. John Gibb & Son, who were the lessees of the Rubislaw Granite Quarries there.

PATENTS.

The Architect.

THE WEEK.

HERE have been many more alarming fires in London ıan was witnessed on Monday morning at Hyde Park ourt, the colossal building at Knightsbridge which puts 'erything in the neighbourhood out of scale. The money ss is not supposed to be more than 17,000*l.*, and that sum ɔes not appal insurance offices transacting business in the :etropolis. But the circumstances were dramatic, and ɜre therefore adapted for imparting extraordinary im-ɪrtance to the fire. In the first place, there was no real nger to any of the inmates. Some got excited and shed to the spots where there was less chance of safety. lady's maid who possessed self-control, and who tried to part her quietude to the hysterical creatures rushing ɔund, told a reporter how "every one seemed to lose his ɪses, and paid no heed to the assurances of the autho-ies of the hotel that the fire-escapes would soon arrive. any who leaped from the windows could have escaped m the place as I did, by keeping cool and following one the porters, who acted admirably throughout, along a ridor to a staircase which led to the rear of the building." at is a picture of a common scene at most fires, and, atever means of safety are devised, we fear there will be ays people who at the first alarm give themselves up for t, and will involuntarily seek death instead of avoiding There was a special staircase in the Court to meet such ergencies, but nobody used it. At Knightsbridge part of building collapsed, but it was as much from the weight water with which it was deluged as from failure of erials. Firemen in such cases cannot be discriminating. ɜ property which was destroyed testifies to the energy of fire brigade and the abundant supply of water rather ɪ to the strength and universality of the flames.

WE recorded a few weeks back the results of the petition for the prizes to be awarded for the most tive of modern façades in Paris, and mentioned the ıouses selected. The next question was the degree of t. It has been unanimously decided to award the place to No. 104 Rue de Grenelle, which was designed M. MARQUET and constructed by M. BARRAUD for MARCHAND. Visitors to Paris will therefore be likely ek out the house before examining the others. The nd place was gained by a house in the Rue du Roi-de-ɜ, designed by M. DEBRIE; the third by the Castel nger, Rue La Fontaine, by M. GUIMARD. The latter been subjected to more criticism than the rest of the lings, and although it is supposed to be an effort to ıcipate Parisians from English ideas about houses, it ves general approbation. The remaining buildings house in Avenue d'Anton, MM. BUNEL & DUPUIS, itects; house on Boulevard La Villette, M. RABIER, tect; and house in Rue Croix-des-Petits-Champs, ɜREFFENDILHE, architect.

.N interesting experiment is now in progress at Orrell, ɜ parish of Sefton, near Liverpool. Alderman JONES, ɪmber of the Bootle Corporation, has erected about ɔlwellings for the workmen who are employed in various ɪtries in the district. There are three classes of dwell-s viz. small, medium and large. The rent charged for ur-roomed cottage is 5*s.* per week, for the five-roomed ıd for the largest size, which has five rooms and a room, 8*s.* a week. Oil lamps used to supply the light, ɜe electric light has been introduced. Two lights of ıle-power are given to the small houses, three to the e-class houses, and four to the large. The tenants l., 6*d.* and 9*d.* per week for the new light respectively. reets are lighted at the owner's cost. In each street will be three incandescent lamps, each of 16 candle-at every 40 or 50 yards. The current is switched on k, and remains lighted till midnight in the houses l dawn in the streets. During the winter months the houses will receive the light from five o'clock in the morning till dawn. The electric plant that has been laid down is capable of supplying between 2,000 and 3,000 8 candle-power and 16 candle-power lights. The dynamo is of the Clayton type, and the motive power will be obtained from TANGYE'S high-speed vertical engines. The main cables are carried overhead on insulators from the generating station not far distant from the houses. In each house there will be one main switch-board, volt meter, watt meter, and automatic cut-outs.

DEAN GREGORY has long possessed a reputation for prudence. It is to be regretted that so venerable a dignitary should at so late a period of his life create doubts about the truth of the opinion relating to himself. The Dean in theory bears most of the burthen of the responsibility for the freaks from which St. Paul's suffers, and the sternest critic would be disposed to let him off lightly. But Dean GREGORY will insist on making the affair ridiculous by appearing to lay down the doctrine that St. Paul's has ceased to be national or diocesan property, and that only those who subscribe to the degradation fund have a right to take an interest in the operations. On Saturday he was more reasonable, for he went so far as to say to the architects who waited on him that the stencil ornament which has been applied to parts of the building is largely experimental. He might have added a few other adjectives expressive of its quality, but we suppose we ought to be thankful for the least concession to common sense. It was also said that the drum was to be adorned with glass mosaics. Although Mr. BALFOUR a few nights ago again stated that the Government were without any control over the cathedral, Lord WEMYSS intends on to-morrow to make inquiries in the House of Lords on the subject, but a satisfactory result is not anticipated.

ON Wednesday a meeting of the Master Builders' Association was held at Derby under the presidency of Alderman HOULDSWORTH, of Bradford. After a very long consideration, a resolution was adopted to the effect that it was quite impossible to conduct business with the existing restrictions and disputes on trivial matters, and that decisive measures must be taken to settle the matters in difference on a permanent basis. It was further resolved that, unless the plasterers agreed to resume work on reasonable conditions at once, a general lock-out of all the men in the building trades be ordered. The resolutions were carried unanimously, and it was agreed to submit them to the Council of the Association at a meeting to be held in Birmingham on Thursday next, the 27th inst. In connection with the plasterers' strike, it is stated that during the first three weeks of the lock-out the funds of the National Association of Operative Plasterers were reduced by about 25 per cent., and this in spite of the fact that, in addition to the special levy, the members paid in during this time about 1,000*l.* in ordinary contributions for sick benefit and superannuation purposes. Some of the members of the Association, who have been bound to the Association by the anticipation of sick or superannuation benefit, are said to have already recognised that any such prospect is rapidly vanishing. They are consequently refusing to make any further purposeless sacrifice, and are leaving the Association.

A SCHOOL in Aix-la-Chapelle, which was founded by CHARLEMAGNE and has been carried on continuously from his time, is about to be suppressed. The education was mainly theological, and therefore was not affected by the advances in secular knowledge. In the Middle Ages the reputation of the school stood high. The old revenues were applied from time to time to other uses, and of late years all that was to be obtained was a sum of about 300*l* a year, which was inadequate to support the Höhere Stiftsschule on its ancient footing. When NAPOLEON held possession of the city at the beginning of the century he decreed that the school should be laicised, and his arrangements were subsequently upheld by the Prussian Government.

GIORGIO BARBARELLI, OR GIORGIONE.*

VASARI expressed the belief among artists in his day when he said, "Giorgione, having seen some of Leonardo's pictures, which were painted with wonderful softness and expressed relief by the unusual darkness of the shadows, was so impressed by them, ever afterwards he continued to imitate the treatment, and succeeded in his oil-paintings to approach the excellence of the originals." The indebtedness of the young Venetian to Da Vinci has been doubted, but it must be allowed there was a great similarity in their lives. Both came into the world irregularly or illegitimately; they were both of fine physique, and their accomplishments made them favourites. According to Vasari, Leonardo's conversation was so pleasing as to win all hearts, and the radiance of his beautiful countenance compelled the most melancholy to become cheerful. He sang to the lute most divinely, improvising verses and music with equal ease. Giorgione likewise "played and sang with the most exquisite perfection, insomuch that he was for this cause frequently invited to musical assemblies and festivals by the most distinguished persons." We are told also by Vasari that from the character of his person and the exaltation of his mind he was called Giorgione, which Mr. Ruskin interprets as Stout George or George of Georges.

There were also differences between the two partly caused by racial peculiarities. Giorgione was happy in the contemplation and creation of beautiful forms. All the more eminent artists believed, says Vasari, that "he was born to infuse spirit into the forms of painting, and acknowledged that he copied the freshness of the living form more exactly than any other painter, not only of Venice, but of all other places." The same authority tells us how much less simple was Leonardo's delight as a painter in beauty, for "it appeared to him that the hand could never give its due perfection to the object or purpose which he had in his thoughts or beheld in his imagination." Giorgione was satisfied with the superficial aspect. Leonardo's mental vision went beyond outward form; he sought the causes of the effects. In fact, his life was a continuous searching. To paint a monster, he lived among putrid bodies, as if ideas could be excited by stenches no less than terrible forms. To paint shadows he produced a black of an intensity more deep than any known to painters. His anatomical drawings are so painstaking they were admired by William Hunter. But to a Greek of the days of Phidias the restless, unsatisfied longing of Da Vinci would appear to be less becoming in an artist than the ardour of Giorgione, who "gave his whole heart to the beauties of nature, and would not attempt to represent anything for which he had not found a living model."

Time has, however, treated the two men with equal severity. Where are Da Vinci's works? His *Last Supper* was so often repainted, it is no longer in a state for which he could be held responsible, and he would be likely to disown it. His cartoons have vanished, including one showing a landscape with which Vasari was acquainted, and which in spite of his prejudice against the artist he considered so beautiful, "there is no genius in the world, however god-like, who could produce similar objects with equal truth." Among the works attributed to Leonardo, the unfinished *Mona Lisa* alone is generally accepted as authentic. Luini, Salaino and other pupils now receive credit for works which once were ascribed to the master.

Giorgione is no less unfortunate. At one time his works were considered essential in all galleries of any note. Modern criticism has reduced the number to a surprising extent. Crowe and Cavalcaselle maintain there is only one genuine work by Giorgione, viz. the *Concert* in the Pitti Palace, Florence. In the latest "Kugler" it is described as an early picture by Titian. The altar-piece in the church of Castelfranco, the painter's birthplace, and long ascribed to him, has probability in its favour; but it is only tradition which supports the belief of Giorgione being a native of the town. Herr Mundler, however, says, "Only one picture is quite certain and authenticated by documents, the altar-piece of the principal church at Castelfranco." The *Concert Champêtre*, of which we publish an illustration, according to Crowe and Cavalcaselle, is by an imitator of Sebastian del Piombo, who was a pupil of Giorgione. Signor Morelli, who has devoted much pains to the study of the painter's works, says it is a genuine example of the master, and that "the introduction of nude female figures contrasted with the rich dresses of the two musicians gives a measure of Giorgione's power." The Signor believes that twelve pictures exist which can be accepted confidently as productions of the painter. They are the *Ordeal by Fire* and the *Judgment of Solomon*, with the *Knight of Malta* in the Uffizii; a *Christ Carrying the Cross* at Vicenza, the altar-piece at Castelfranco, *Giorgione's Family* (a gipsy woman and child and a soldier separated by a stream) in Venice, the *Madonna with SS. Roch and Antony* in the Madrid Gallery, a cassone picture in the Seminario, Venice; the *Three Stages of Life* in the Pitti, a fragment in the Esterhazy Gallery, Pesth; the *Three Philosophers* in the Vienna Gallery, the *Sleeping Venus*, formerly ascribed to Titian, in the Dresden Gallery. By many experts this list will be considered extremely lax, but it will be observed that although he has widened the bounds Signor Morelli is unable to admit a single picture in an English collection.

There is so much uncertainty on the subject, Raphael Mengs was not to be blamed for having in the last century declined to believe that Giorgione was the inventor of the deep and glowing style of colour associated with his name. Tradition ought, however, to count in such cases, and the Italian connoisseurs may be right in their eulogies of Giorgione, and in crediting him with an influence upon the early works of Titian and Sebastian del Piombo.

In his frescoes Giorgione has been as unlucky as in his easel pictures. Time, or rather the salt spray of Venice, has operated on them in merciless fashion. Artists and owners may have anticipated that result, but it could not be avoided. So much of Venetian life was passed in the open air, the beauty of buildings was not confined to interiors. It was considered a duty to expend wealth on the outsides of palaces and public buildings. In a like spirit frescoes were commissioned to adorn parts which could be seen by all who passed. In that way Giorgione came to paint a façade near Sta Maria Zobenico, a second near S. Vitale, and two others in the same neighbourhood, the Casa Sorenzo near S. Paolo, his own house near S. Silvestro, and the Casa Grimani near S. Ermacora. He and Titian painted the façades of the Fondaco dei Tedeschi, but of their work only a single figure remains and its authorship cannot be determined. Vasari says Giorgione's part, and owned he was unable to understand the meaning of the figures, nor could he discover any one who was able to instruct him. Evidently there were many single figures, some with symbols, and, in spite of the obscurity, Vasari testifies to their fidelity to nature and their originality. Although destined to be evanescent, the frescoes exercised much influence on the Venetian style. As Eastlake says:—

The Venetian painters, as compared with those of the schools of Lombardy and the Netherlands, appear, with few exceptions, to have systematically avoided a preponderance of deep shade. This must be understood as meaning no more than that their treatment of light and shade was calculated for works of large dimensions. From the first the great Venetian colourists were accustomed to execute frescoes in the open air, and sometimes in situations where the distance at which their paintings could be viewed was far greater than their size required. The elements of distinctness and breadth were thus familiar to them, and, it must be confessed, were sometimes transferred to works which, admitting of near inspection, might have suggested a different treatment. "Venetian shadow, which, notwithstanding the occasional darings of Tintoret in more capricious directions, is characteristic of the school, and which the praise of Agostino Carracci has rendered proverbial, is the worthy auxiliary of composition on an extensive scale, and is fitted, by combining distinctness with breadth, to convey the uncertainty which arises from distance or want of light. It is calculated to give place and meaning to form, to display remembered attributes of colour, and, while it renders forcible local hues indispensable, to combine solidity with clearness. The view which the Venetian artists took of nature was consistent with the ordinary destination of their works. They appear in most cases to have assumed that the objects to be represented were seen by the diffused light of the atmosphere, as opposed to the case where the light is derived from a particular source. The practical result of this is that in

* See Illustration.

shadow is smaller in quantity, and that the picture is chiefly composed of gradations of half and reflected light; brightness thus marking projection, and obscurity depth. It has often been said that in Venetian pictures (more constantly than in those of other schools) the foreground objects are, relatively to their lines, the lightest, the retiring ones being lower in tone. The diminution of the force of shade in remoter masses, the introduction of accidental cast shadows, of dark hues near, and bright objects, buildings or sky in the background and distance, may conceal without altering the artifice. This system of effect in Venetian pictures corresponds with that of nature, and, like that, is too familiar to be remarked; but its apparent simplicity conceals a scale of gradation the fulness of which may be more difficult to compass than the pronounced effects of confused light. Hence the unaffected character of "Venetian shade;" and hence, at the same time, its power in marking the essentials of form, while it leaves the general idea of colour unimpaired.

Owing to its relation with external fresco-painting, Venetian painting could not fail to assume a decorative character. In that way we also see its affinity to Eastern work. But the Venetian artists were not disposed like their Byzantine predecessors to formal arrangements. VASARI, as we have seen, was nonplussed before the fresco of GIORGIONE because there was "neither arrangement of events in consecutive order, nor even single representations depicting the history of known or distinguished persons, whether ancient or modern." The Florentine, we suppose, expected to see the Fondaco de' Tedeschi covered with scenes like those which MICHEL ANGELO and LEONARDO DA VINCI designed in rivalry, or a series of biblical scenes resembling those of the gates of the Baptistery. The disregard for precedent shown by GIORGIONE could not be approved by VASARI. He should have known that decoration in Venice was designed on principles which differed from those adopted in Florence. It would, perhaps, have been better if some universal principles were adopted. But the Renaissance signified liberty, and each of the schools wished to be distinguished by qualities which could be considered as characteristic. The Venetians could not have laid definite rules to separate decorative from ordinary easel pictures. In both the artists were inspired by the spirit of the time and place. Comely figures which usually appear to be portraits, rich costumes, noble architecture, figure the elements of the pictures. Then there was uncommonly animation which appeared to be bustle, and recalled the scenes of daily life. The wealth and vigour of the inhabitants are recalled by scriptural scenes, and consequently artists like TINTORET and VERONESE were bound to be popular.

But in human nature there is always a tendency to reaction. Many men and women in Venice must have been wearied by the constant activity they saw everywhere, and were eagerly sought to escape from it. ALFRED DE MUSSET expressed a natural instinct when, in his story "Le Fils du Titien," he represented the son of the great painter as trying to forget what he owed to his name and his ability. The daughter of one of the senators wishes to see him recognised as the successor of his father, but he realises that much labour is indispensable, and he considers that is of too brief a tenure not to be enjoyed. To the last he was faithful to idleness and to his fair counsellor. In the *Concert Champêtre* we can see the expression of a like mood. Mr. PATER at least interprets the picture in that way:—

"In the school of Giorgione you drink water, perfume, music, in receptive humour thus for ever, and the satisfying moment is assured. . . . Life itself is conceived as a sort of dreaming—listening to music, to the reading of Bandello's tales, to the sound of water, to time as it flies. Often such moments are really our moments of play, and we are surprised by the unexpected blessedness of what may seem our least important part of time; not merely because play is in many instances that to which people really apply their own best powers, but also because at such times, the stress of our servile, everyday attentiveness being relaxed, the happier powers in us without us are permitted free passage, and have their will with us. And so, from music, the school of Giorgione loves often to play which is like music; to those masques in which men avowedly do but play at real life, like children dressing up" disguised in the strange old Italian dresses, richly coloured or fantastic with purfling and furs, of which the painter was so curious a designer, and which, above all the rich dress white linen at wrist and throat he painted so dexterously.

And when people are happy in this thirsty land water will not be far off; and in the school of Giorgione the presence of water—the well or marble-rimmed pool, the drawing or pouring of water, as the woman pours it from a pitcher with her jewelled hand in the *Fête Champêtre*, listening perhaps to the cool sound as it falls, blent with the music of the pipes—is as characteristic and almost as suggestive as that of music itself. And the landscape feels and is glad of it also—a landscape full of clearness, of the effects of water, of fresh rain newly passed through the air and collected into its grassy channels; the air, too, in the school of Giorgione, being as vivid as the souls which breathe it and literally empyrean, its impurities burnt out of it, no taint, no trace or floating particle of aught but its own clear elements allowed to subsist within it. The scenery is such as in England we call "park scenery," with some undefined refinement felt about the rustic buildings, the choice grass, the grouped trees, the undulations deftly economised for graceful effect.

It may seem unaccountable why there should be such a mixture of nude and draped figures as we see in GIORGIONE'S picture. In the sixteenth century there was less strangeness about the contrast. Pictures were to be seen even in churches which were composed in a like manner. Groups in which the figure of St. SEBASTIAN was an element were familiar. MASACCIO'S *Recovery of the King's Son* has one naked figure in the centre of a crowd. Two are seen in BOTTICELLI'S *Calumny*. The incongruity when seen in the *Concert* and in TITIAN'S so-called *Sacred and Profane Love* imparted interest to the work. It became a riddle for which many solutions could be offered. Modern realism does not see any absurdity in the contrast, for in M. ZOLA'S "L'Œuvre," the unfortunate hero endeavours to gain a footing among artists by attempting a similar work, not merely out of rivalry to GIORGIONE, but because he was inspired by a love of symbolism, and he imagines the public will gladly try to give a solution of what he attempted. There was unquestionably such a picture exhibited, and those who remember it will be disposed to conclude that GIORGIONE is unapproachable.

PONTOISE.

By JOHN A. RANDOLPH.

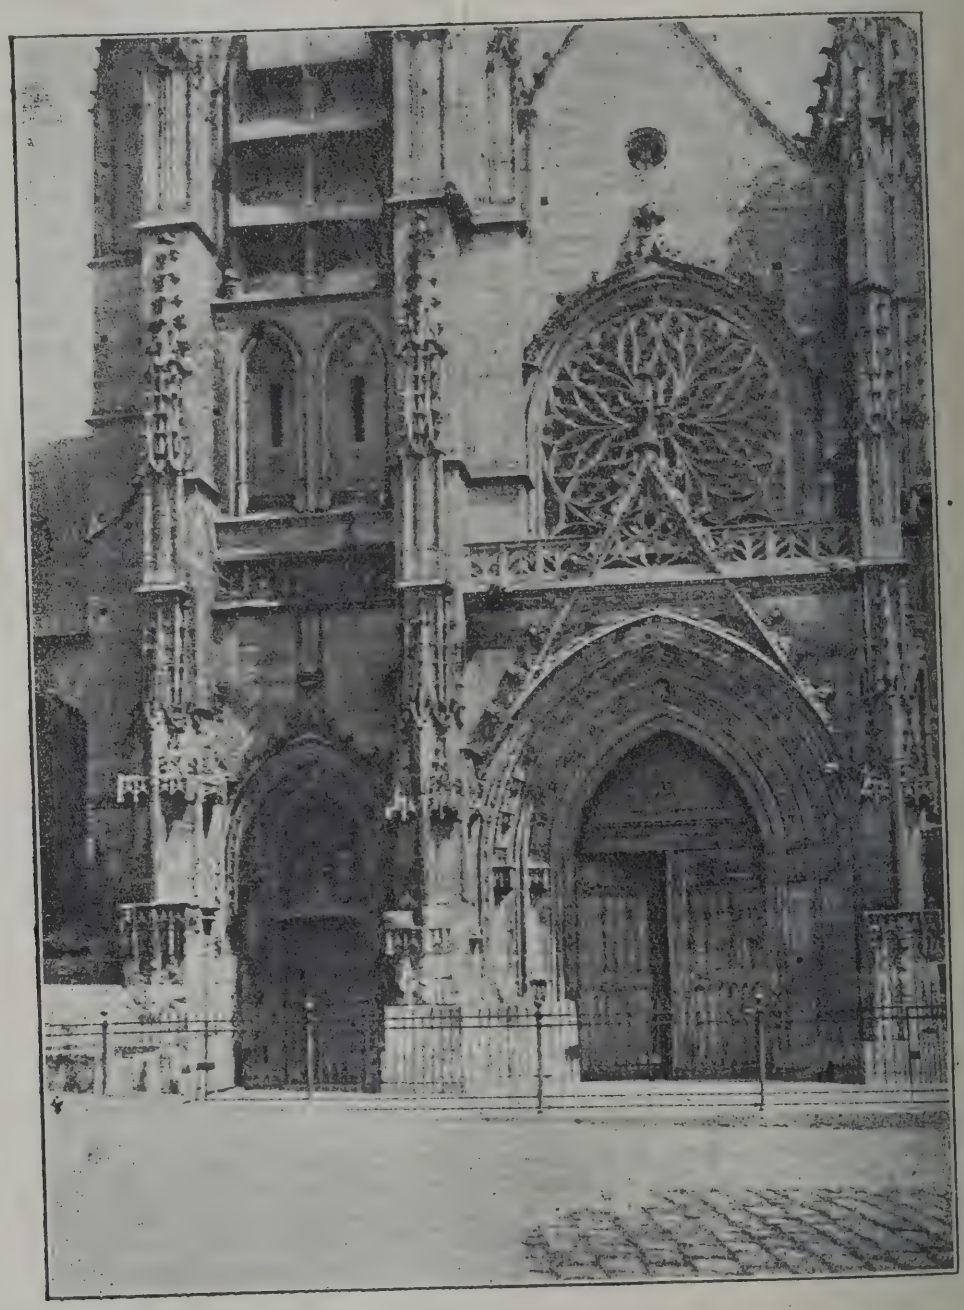
ON the Oise (from which the town takes its name), a tributary of the Seine, at about 25 kilometres north-west of Paris, lies this town. It is a strange architectural medley and full of irregularly-formed streets, some in the lower town on level ground, and some on the stupendous church-crowned hill which overlooks a fine broad street leading to the station, and whence the country round is visible for miles, the lay of the land being very flat about the approaches to Paris on that side.

Few people think of breaking their journey between charming Dieppe and Paris otherwhere than at Rouen, and they therefore, as a rule, leave Dieppe by the boat train as if that were the only way thence to Paris. However, the route to Pontoise, by Gisors (whose church is well worth a visit), is preferable, from a mere landscape point of view, to that from Dieppe to Paris by the boat line, and many of the churches en route are picturesque, to say the least.

On leaving the station towards the town, a few paces down the broad avenue of trees bring us to a cross-road, and on the right over the bridge is an excellent hotel, and from there, through irregular streets and over some very fine specimens of cobbles, an otherwise easy road leads us to the Place by the church of St. Maclou.

The fifteenth-century west front is not unlike that of St. Jacques at Dieppe, at first sight. The north-west chapel is due to the design of PIERRE LEMERCIER, who also designed the church of St. Eustache at Paris. He was born here, and died after 1560. JACQUES LEMERCIER, Cardinal RICHELIEU'S architect, also a native of Pontoise, worshipped in this church, which dates from the twelfth century. The west door is under a rich canopy, which cuts through a Flamboyant cusped and panelled balustrade near the top, and has a graceful circle in its apex. Slightly receding is the gable, with a beautiful and elaborate rose-window under a pointed arch, with a rich be-crocketted dripstone, its finial serving as a carved bracket for a statue over, but that idea was not carried out, and the crocketted gable has a tiny traceried circlet instead.

On either side of the door are richly niched and pinnacled buttresses, also statueless like the arch of the door. The base of the tower has an elegant window and door, almost a replica of the side door of the west front of St. Maclou at Rouen.



The balustrade pattern crosses the tower front, and above it are comparatively plain shafted lancets without capitals. The top of the tower, though picturesque, is Renaissance, the structure not having been completed in Gothic times.

The church, which is fine inside, with good glass of the ixteenth century, has a most curious "Entombment" of hat period, with eight figures grotesquely carved in stone.

reach the church of Notre-Dame—a low structure with very late Gothic tracery, the church being, generally speaking, Renaissance. It contains the twelfth-century tomb of St. Gautier, with quatrefoils on each of its sides and bearing his statue. The arrangement of the church is a trifle out of the ordinary, with a votive chapel in the thickness of the west front and close to the door, whence there are a few steps down to the floor of the nave.

The chapel of the Hôtel-Dieu contains a painting by Philippe de Champaigne, who painted the portraits of Cardinal Richelieu which are now in the (inter-) National Gallery.

Among the well known names of history Pontoise can

Pontoise, St. Maclou.

Underneath the group are six others, representing the "Resurrection." There is also a fine Madonna in stone and some funeral monuments, and Jouvenet's picture of the "Descent from the Cross."

Walking round the church, one comes to the parapet overlooking the wonderful flight of steps which lead down to the main road to the station. The view from the parapet is striking. It is said that this great feat of construction was necessary in order to save the church. Near by is Jacques Lemercier's house, which, we believe, is not but should be a "monument historique."

Descending the staircase and proceeding along the road to the station we branch off to the right in a line where we made for the hotel on arrival; after a few minutes' walk we

lay claim to the following natives:—Philippe le Har (1342-1404), Pierre and Jacques Lemercier, Gene Leclerc (brother-in-law of Napoleon); while the Depa ment itself boasts of, among others, Philip-Augus (1165-1223), king of France; St. Louis (born at Poiss Henri II. and Charles IX.; Bullant (one of the great French architects of the Renaissance); Duplessis-Morn (the Huguenot Pope); the Duc de Sully; Louis XI Philippe V., king of Spain; Louis XV. and XVI.; Phili d'Orléans, Philippe-Egalité, the Abbé de l'Ep Louis XVIII., Geoffroy St. Hilaire, Daguerre (inventor of the Daguerreotype), Dantan and Ferdina de Lesseps.

Pontoise being within easy reach of Paris (St. Laza

passengers from Dieppe preferring to go straight on to the capital first can visit Pontoise in the morning after café au lait, and have déjeuner there, do Mantes in the afternoon, and be back at Paris for the table-d'hôte. Several interesting day tours can be got in from Paris on the same plan.

"THE DRUIDS ELECT."

WAGNER'S howlings and trumpetings and drummings have overcome the sweetest music ever associated with archæology. Norma and Oroveso the arch-priest, Pollio and Adelgisa have vanished, and their melodious recriminations no longer move us. With them the Druids have ceased to have a footing on the British stage, and those who are ambitious to be initiated into the ancient rites and mysteries must go through a novitiate in the "grove" of some humble public house. We are therefore grateful to Messrs. G. B. Carvill and Gervase Bailey, the authors of the Architectural Association's play at St. George's Hall, for reanimating those ancient and renowned Britons who in the possession of all knowledge, including architecture, deserve respect, and who have bequeathed to us in Stonehenge a bewildering puzzle which can never be made out and a structure which no painter, wax-coater or stenciller would dare to improve. But the dramatists have not fully risen to the height of the great argument with which they were inspired. Instead of endeavouring to fathom the profundities of Druidism, and in that way to discover the mechanical and other power employed in raising the temples, the geological skill seen in the selection of stones from unknown quarries, and the mastery of principles which must have been exhibited in covering the enclosure in days when waterproofs and umbrellas were unknown, they have allowed themselves to be effeminately vanished. Instead of a poetic elucidation of statical problems, we have a love story. What is more terrible, they have dared to rhyme disrespectfully not only about the Northern gods but their ministers, who are supposed to express themselves in the following frivolous style:—

When Thor has turned his face in wrath, his pity must be wooed
With a couple of fat oxen—and beef is very good;
And when we're getting tired of beef and want a change of diet,
Then Woden asks for chicken, which is given to keep him quiet;
And Friga's fond of sausages, and Saturn's keen on veal.
Oh! 'tis thus the gods reward us for our piety and zeal.
Benedicite.

Whether the poets have caught that sort of language from the chorus-girls, or the reverse, we cannot decide. All we know is that those young people appear to exercise far more influence than is consistent with the safety of a State like Druidic Britain. The time, too, is momentous. Fifteen years before, Julius Cæsar had landed in order to send the historic telegram *Veni, Vidi, Vici*, and then departed, arriving in Rome prior to the delivery of the message. An exploring party from Rome had just arrived when the play opens, in order to establish civilisation among us, with its school boards, county councils and strikes. The leader was Rodesius, the chairman of the Roman Chartered Company of Great Britain, Limited. This is and the company's aims are explained by another explorer, Rougepot, who, although he has risen to be arch-druid—and a very arch one he is—we suppose was not an ancestor of the renowned traveller who enlightened the British Association at Bristol. Architecture is not excluded from the purview, for the company has representatives in a street which recalls the other financier who conquered at Blenheim. Says, or rather sings, Rougepot about the unlimited capacity for receiving commissions to be found there:—

If to planning you aspire
And would gain your heart's desire
With a site that is distinctly limited;
And you need to cut it fine
In eighteen ninety-nine,
When the length of the British purse is limited;
Say a fifteen-frontage plot
To accommodate the lot,
You'll grant that that is just a little limited.
Just call at Marlborough Street,
The boys will do the feat
With varieties clever and unlimited.

Chorus.

With varieties clever and unlimited,
Though the trials to contend with are unlimited.
But with Voysey on the night
You bet it goes all right,
For the student's keenness is unlimited.

For the moment Rougepot's own designs are for abstracting a part of the wealth of Ashlar and Rubble, architects, but not in partnership, who are rivals for a seat on the Council of the Druids, vacated by the death of the eminent and lamented Stucco. Rubble holds that services should be rewarded, and pays his gold pieces like a believer in illicit commissions, but Ashlar holds with Lord Russell of Killowen. The Arch-druid accordingly manœuvres and demands that whoever wins must surrender his greatest treasure. For Ashlar it is his daughter Blodwen.

The young British damsels therefore resolve to seek some happy region where "the sun of freedom shines undimmed by the dark clouds of priestcraft and tyranny, where the rights of women are respected, where men will grant us the honours that are due, will acknowledge our superiority in intellect, insight and wisdom, and will finally lay at our feet the government of the world." Their resolve becomes known to Rougepot and Rubble, who, like respectable members of society, are resolved to endeavour to avert the impending calamity and save the thoughtless creatures. They have a sympathiser in Superfinus, who, although a Roman lieutenant, is a weak being, prone to sing sentimental songs, and who admires Blodwen, who also expresses her troubles in a tuneful manner. Ashlar, by force of circumstances, is not only willing to offer that young person as the victim, but adds, he would willingly sacrifice a hundred daughters to Art, which in this case, we suppose, means the advantages of being on the Council. For a new temple is to be raised, and a lady is a more economical offering than coins of the realm and a collection of newspapers.

The preparations for laying the foundation-stone show the familiarity of the dramatists with such proceedings. As on such occasions there is conversation among the witnesses, and Rodesius describes the Institute he once founded for the promotion of elementary knowledge among architects, in which fees are obligatory, although the candidates never pass. His revelations anticipate the practice in another institute where the wind is raised by the aid of a succession of dupes:—

The students went in one by one to the Institute at Rome;
The students went in one by one to the Institute at Rome;
The students went in one by one, and some were in earnest and some in fun,
But we took all their fees and said, "Let 'em all come
To the Institute at Rome."

The students went in two by two; when told to describe a pargetted blue,
Said, "A hole where the smoke is supposed to go through"
At the Institute at Rome.

The students went in three by three; they designed with a pencil bold and free;
The result was something for Barnum to see
At the Institute at Rome.

The students went in four by four; when asked to describe a fireproof floor,
Said, "A thing that falls down on the salvage corps
At the Institute at Rome."

The students went in five by five; to answer our questions they'd honestly strive,
But they left the room more dead than alive
At the Institute at Rome.

The students went in six by six; when asked the process of burning bricks
They said, "Oh, that's one of the builder's tricks
At the Institute at Rome."

The students went in seven by seven; when told to design a mansion in Heaven
They asked if the site was sold or given
To the Institute at Rome.

The students went in eight by eight; the husbands described a "Ladies' Slate"
As "A thing that you got when you came home late
From the Institute at Rome."

The students went in nine by nine; when told to define a building line,
Said, "A thing invented to spoil design
At the Institute at Rome."

The students went in ten by ten; to the question, "By whom was Rome built and when?"
Said, "In 1900 by Christopher Wren
For the Institute at Rome."

The students went in eleven by eleven; to make up a rhyme I have
painfully striven,
But I can't get anything different from seven
For the Institute at Rome.

The students went in twelve by twelve; we packed all their papers in
rows on a shelf;
If you want any more you can read 'em yourself
At the Institute at Rome.

But the sacrifice of Blodwen is not to take place. Rodesius, as becomes a company promoter, has an admiration for simplicity; and Superfinus, if he were only possessed of money, would be sure to believe in a prospectus which promised an enormous dividend. So he resolves to help the lieutenant, and meanwhile he moralises on simplicity as it appears in some modern forms, and particularly in modern architectural practice :—

To the arty-crafty genius who wishes to be known,
It's simple—oh, so simple;
He nurses up a theory till it's very fully blown;
He's simple—oh, so simple.
And if it is a subject for which no one cares a jot,
To the editors he'll cotton till they publish all his rot,
You cannot check his ardour, he's possessed of such a lot;
He's simple—oh, so simple.
Oh, it's really very simple if you want to climb to fame
By a little gentle puffing just to advertise your name;
But there's a little maxim—remember it, I beg—
"It's not the hen that cackles most that lays the largest egg."
The art of modern architects is tending towards the plain
And simple—yes, the simple;
We build for Truth and Beauty, and not for worldly gain;
We're simple—oh, so simple.
If you want to build a house that will the mouths of critics stop,
Put four bare walls with windows, like a warehouse or a shop,
And a fat unwieldy drain-pipe from the bottom to the top;
That's simple—oh, so simple.
Oh, the simple simplo-maniac has got us in his claws,
He'll soon dispense with windows, and he'll do away with doors;
We'll return to what we were before the dawn of history's page,
And we'll play the noble savage in the Neolithic Age.

All is arranged satisfactorily and there is a general emigration to Rome, for, as is said :—

As far as architecture goes this country is a frost,
I agree with Mr. Aitchison, poor Britain's art is lost.

We ought to say more about the neglect of an opportunity for a disquisition on the Druids, their works and their philosophy. We are, however, afraid it would be labour in vain. Messrs. Carvill and Bailey are too impressionable to do justice to a subject that is archæological and scientific. It was pardonable to suppose that Ashlar was possessed of a fair daughter, but having once evoked her presence they were unable to restrain themselves from spending time which could be so well employed for the Association classes in listening to her singing such strains as the following, and which express Druidic magic :—

Last night the blood-red sun sank down in the crimson-clouded west,
And the shadows crept when the forest slept and the flow'rets had sunk
to rest,
The peace of Night held land and sea and every heart but mine;
For black-robed Fear came stealing near and looked—but made no sign.

The night wind sighed till the echoes died in the nightingale's low
refrain,
And the rustling trees like far-off seas murmured of grief and pain;
The sad-eyed stars looked down and wept for the sorrow that is to be;
Oh! the gods are great who weave our fate—but their wrath is poured
on me.

But as I gazed one star alone stooped from the skies above,
And the heavens grew light and the earth grew bright as it whispered
to me of love,
Whispered of love and of patient hope and of faith that sees afar;
Joy in sorrow, hope for the morrow—Night and the Morning Star.

All who heard Miss Sophie Tyler interpret the words and Mr. Butler's music, on Wednesday, would, we suppose, be willing to condone the authors' disregard of technical subjects. Mr. G. B. Carvill as Rubble and Mr. Gervase Bailey as Pennialinus did ample justice to their own composition. Mr. Herbert Passmore as Rougepot and Mr. F. D. Clapham as Rodesius were excellent. The voice of Mr. Constanduros rendered justice to the serenade of Superfinus. The whole performance upheld the reputation of the Association for amateur acting.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, W., Mr. G. H. Fellowes-Prynne, president, in the chair.

The Chairman, who announced the commencement of Mr. Weedon's water-colour class, said he could not advocate too strongly the many advantages which this class offered to the student.

The house list as nominated for the ensuing session was read, the name of Mr. G. H. Fellowes-Prynne again appearing as president, Messrs. E. Howley Sim and H. T. Hare, vice-presidents.

Mr. F. W. Pomeroy, Royal Academy Gold Medallist for Sculpture and instructor of the Association's Modelling Class, gave an illustrated lecture on

Carving and Modelling as Applied to Architecture.

Mr. Pomeroy said it would be presumptuous on his part to take up so important a subject, which had been treated exhaustively by many distinguished authors, and attempt to unfold it within the compass of a lecture. He intended to supplement his own want of originality and literary skill by cribbing boldly from a paper by Professor E. A. Gardner, who had devoted much time and thought to the study of early Greek carvings, and whose conclusions were approved by many sculptors. In order to exemplify the subject, photographic slides of typical works would be presented. In starting, it would be well to remember that, like all things, sculpture was ruled by laws, and its history was a story of evolution rather than of creation. When the art ripened in one place germs were carried elsewhere, which took root, and coming under new influences, the flower exhibited corresponding differences. There was a connection between art and government, which when settled was favourable to development, but conquest and internal decay led to the decline of art. In cities especially the handicrafts flourished, such as those of builders, stone-cutters and carpenters, and out of the tribes of artisans the artists came forth as architects, sculptors and painters. It was not enough to provide habitations for the living, tombs and temples were likewise required, and all were connected with art. In primitive times artistic needs were easily satisfied. A heap of stones served as a memorial with the Israelites, and the simple terminus with the archaic Greeks. But when the beauty of ornament became recognised it was employed to adorn the temple, as the worthiest structure. Massive stones were considered insufficient so long as they were plain. Ornament, according to Mr. Ruskin, was eloquence, and with its aid the truths of religion were expressed from the roof and walls and capitals of temples. In tombs there was no less dependence on art. The effigy of the occupant and the story of his life on reliefs were considered to be records for the benefit of posterity. Architecture might thus be considered as a stem from which the other arts sprang. At first imitation was in the ascendant, and the early Egyptian and Greek sculptors spared no trouble to reproduce in granite and hard marble their copies of floral or human forms. But the superiority of conventionalised forms could not long be concealed. Various interpretations of that process have been given. To a Frenchman the conventional was allied to the trite or commonplace. The word should be taken to express artistic feeling, or the power of the artist to select from an infinite variety of qualities whatever was most characteristic and adapted to his purpose. The Egyptian realised that with porphyry, basalt and granite simplicity of treatment was indispensable, and he took care to avoid whatever was not in keeping with his material. Possessing a less obstinate and more even textured material in his marble, the Greek could allow himself greater subtlety in execution, but it never exceeded the true sculptural limits. He invariably worked from a normal front plane, cutting inwards, but keeping the plane free from projecting proportions. An example is found in the Lion Gate at Mycenæ, where the masonic expression is retained, the outline of the animals being cut in square, while little or no surface carving was attempted. Although archaic work, yet its composition and dramatic force cannot be surpassed.

An unfinished work was often more suggestive of the manner of production than one that was complete. A statue of the archaic Apollo type, about two-thirds life-size, found in Naxos and now in the museum at Athens, served as a revelation of practice. In the first place, we observe the extreme flatness of the surface, front, back and sides. There was a marked curve in the back if tested vertically, but a rule laid horizontally against the back at any height would be found to touch every point from shoulder to shoulder or from side to side. Almost the same sort of treatment was to be observed in front. At the side there was a similar flatness of the breadth of the arm, the outline of the arm had been cut-in parallel to the back and front planes from the side and parallel to the side planes from the front, so that almost rectangular pieces were cut out. If we imagined the statue to be cut through horizontally at almost

any height the section would be contained by lines parallel to the back and front of the statue, and other lines at right-angles to them parallel to the sides. Taken across most parts of the body the section presented a rectangular parallelogram, with a smaller rectangle attached at each side for arms. The corners were not of course quite sharp, but they were not worked off enough to obscure the rectangular form. It was evident the vertical outline of the figure from the front or side must have been drawn freely, while the horizontal section at any point was dependant for its outline on two parallel systems of lines at right-angles to one another. The ancient process was the same as that now employed whenever a sculptor set to work on a rectangular block of marble and began to hew a statue out of it. But how far were the results derived from the Naxos Apollo applicable? There was no doubt that many archaic figures were square on a horizontal section, and especially those which belonged to the Ionic and Island schools. Among the examples might be cited the Brachidæ figures in the British Museum; the archaic statue of a woman dedicated to Artemis by Nicandra, found at Delos by Homolle; the winged figure by Archermos from Delos; the Apollo of Thera, some of the female statues found on the Acropolis at Athens. Other figures showed round horizontal section, particularly at the waist, such as the Hera of Samos, the early figures of Apollo from Bœotia, the Apollo Orchomenus, the Apollo Ptous. The inference could, therefore, be drawn that they were produced similarly to the unfinished figure from Naxos.

Another example of an unfinished statue dated from a later period, probably the fourth century B.C., or Phidian era. It was one of a group of sepulchral memorials from Rheneia, and was also less instructive about modes of execution. Over the brow in a part of the marble that was to be removed after completion of the figure are three small drilled holes. Between the feet was a similar projection with another hole, and a third was outside the left foot. They must have served for fixing a rod or line that was intended to aid the artist in dealing with the front plane. We also find that the block was still in its original untouched state at the back up to the shoulders, while it was roughly chipped from the feet to the middle of the shins. From the shins to the junction of legs with the body there was still more chiselling, and the limbs were consequently indicated. In another part irregular round holes were found evidently produced by a rounded chisel or gauge, and which were sunk preparatory to the removal of the intervening layer of marble. In another part the marble was worked sufficiently to give an approximation of what was contemplated. In the upper part of the chest and arms, neck, head and drapery there was evidence of the use of a running drill and of a fine claw chisel. It was not, however, clear how the fine detail and play of surface was to be rendered. It was important to know that there was no indication of the employment of a finished clay or plaster model from which, as in modern practice, points were taken mechanically. The Roman sculptors possessed "puntelli," and in an earlier time possibly such aids were known. Whether clay models were used was disputed. But it seemed incredible that Phidias could have had so large a quantity of sculpture executed as existed at the Parthenon unless with the co-operation of craftsmen who worked from models.

Modelling in clay was familiar from an early period. The Egyptians represented their god Num as a clay-worker or potter. The Greeks used terra-cotta extensively, not only for buildings, but as statues and, on a small scale, as votive figures. Some of the clay figures were of a toreutic nature, having parts formed of other materials. The Greek sculptors also employed gypsum or plaster for their figures. They were masters in moulding, and for statues which were too large for that process they used cores of wood and covered them with metal plates. Sometimes wood was employed without a metallic covering. In the British Museum was a cast of a figure of a charioteer which was presented by the French Ambassador. It was taken from a work in bronze, but the peculiarities of sculpture in wood were manifest in the long straight lines of the draperies. The head, arms and feet suggested a different treatment and texture, and originally must have been modelled in wax or clay.

Modelling in clay or soft wax was a system of building up forms by the addition of pieces of the material, until such a surface as the sculptor desired was obtained. The material was worked with boxwood or ivory tools and wire, but the fingers and thumb were the modeller's tools *par excellence*, and since the old legend of the "potter's thumb" French artists attained in their modelling a very high level, it may be at the loss of that monumental dignity and repose which is essential in all architectural work. Modelling could be employed for many purposes in connection with architecture, such as preparing details for ornament whether in stone, wood or plaster. One of its best uses was in the production of small scale models for portions or the whole of a building. There was no better means of arriving at the general effect of light and shade in a building than by preparing a rough model of about two inches to a foot, and for the architectural sculptor it would be invaluable.

The subjects selected for illustration ranged from Assyrian sculpture to modern works. They included bas-reliefs from the Palace of Assur-Nasir Pal, the Pediment of the Parthenon, with metopes and portions of the frieze, the *Venus of Melos*, the Castellani Head of Venus, Mexican sculpture, Roman portraits by Greek sculptors, Indian sculpture, Renaissance altar or shrine from Padua, *St. George* (Florence), Ghiberti's Gates, Cellini's *Perseus*, Verocchio's *Colleoni*, Michel Angelo's works, Donatello's *Madonna*, Della Robbia's *Madonna*, Jean Goujon's reliefs, ceiling from Bromley Palace and other buildings, carving from Paul Pindar's house, &c., Fremiet's *Jean d'Arc*, Foyatier's *Spartacus*, group by Barrias, *Gloria Victis* by Mercie, *St. John* by Rodin, *Mirabeau* by Dalou, *General Outram* by Foley, group from Wellington Monument by Alfred Stevens.

The Chairman said it was hard to realise why students put off the study of modelling in their architectural work, but he regretted that modelling was ignored by many young architects. It seemed the truer part of their craft, and if a student wished to understand the orders in architecture he (the chairman) thought there was no better way than by modelling their forms instead of hanging over a drawing-board.

Mr. Stirling Lee, who proposed a vote of thanks, said the lecturer had ably brought before them the problems which came into a sculptor's work. Perhaps the range of a sculptor's art was so large that it could be easily understood that many difficulties did arise in the work, but he (the speaker) thought a capital of a column could afford all those problems which did exist in sculpture. When dealing with the embellishment of a building the sculptor was controlled by the line of the building, the relief of his work being governed by the light and shade of the architect's mouldings.

Mr. W. H. Seth Smith seconded the vote, which was supported by Messrs. A. W. Hart and E. Howley Sim.

Mr. Pomeroy briefly returned thanks, and, in answer to a question put to him as to the most effective depth of relief to work in, said the depth of relief depended on the exigencies of the design.

BRISTOL SOCIETY OF ARCHITECTS.

THE monthly meeting was held at the Fine Arts Academy, Clifton, on the 10th inst., Mr. W. L. Bernard, F.R.I.B.A. (president), in the chair. Mr. Edgar Singer, of Frome, read a very interesting paper on "Memorial Brasses and Enamels," and the lecture was illustrated by numerous rubbings of fine specimens of German, Flemish and English brasses. The different varieties of enamels were explained, and specimens of Limoges, cloisonné, &c., exhibited. The lecturer traced the evolution of these interesting links with the past from the simple inscribed cross of pre-Christian times to the elaborately chased and enamelled brasses found on the Continent in the Middle Ages, which so clearly portray the costume, armour and textile fabrics of that period. At the conclusion of the paper a very hearty vote of thanks was accorded to Mr. Singer, upon the proposition of Mr. G. H. Oatley, seconded by Mr. La Trobe.

The voting papers for the election of officers and Council for the ensuing session were then opened, Mr. W. L. Bernard being again re-elected president, Messrs. Joseph Wood and Frank Wills were elected vice-presidents, and the hon. secretary and treasurer (Mr. H. Dare Bryan) was unanimously re-elected to fill these offices, the members of the Council being Messrs. Bond, La Trobe, Oatley, W. S. Paul, Skinner and J. Foster Wood.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE annual meeting was held at the School of Art, Mr. R. W. Fowler in the chair. The following were elected members of the Society:—Mr. Henry Coverdale as fellow, Mr. W. T. Lancashire as an associate and Messrs. S. M. Gibson, B. H. Loukes and B. J. B. Marsden students. The treasurer's statement of accounts, which showed a balance in hand of over 124*l.*, was adopted. The annual report, which dealt chiefly with technical matters, was adopted. The total membership is 116. The following were elected officers and Council for the year 1899-1900:—President, Mr. J. Smith; vice-president, Mr. A. Smith Denton; hon. treasurer, Mr. Fred Fowler; hon. secretary, Mr. W. C. Fenton; council, the above and Messrs. E. M. Gibbs, C. Hadfield, C. J. Innocent, T. Winder, J. B. Mitchell Withers and J. R. Wigfull.

The Annual General Meeting of the Liverpool Architectural Society will be held at the Law Library, 41 Castle Street, on Monday, May 1, at 6 P.M.

NOTES AND COMMENTS.

IT is not everybody who has the "Parentalia" at hand, and consequently when the question is asked about WREN'S intentions for decorating St. Paul's an answer is not forthcoming. Mr. C. L. EASTLAKE has opportunely supplied an extract which explains WREN'S scheme for the dome. It is as follows:—"The judgment of the surveyor was originally, instead of painting in the manner it is now performed, to have beautified the inside of the cupola with the more durable ornament of mosaic-work, as is nobly executed in the cupola of St. Peter's in Rome, which strikes the eye of the beholder with a most magnificent and splendid appearance, and which, without the least decay of colour, is as lasting as marble or the building itself. For this purpose he had projected to have procured from Italy four of the most eminent artists in that profession; but as this art was a great novelty in England, and not generally apprehended, it did not receive the encouragement it deserved. It was imagined also that the expense would prove too great and the time very long in execution. But though these and all objections were fully answered, yet this excellent design was no further pursued." Economy prevailed, and contrary to WREN'S wishes, the decoration of the cupola was entrusted to Sir JAMES THORNHILL.

THE position of the Basilica Æmilia in the Forum Romanum has been one of the problems which have caused contests among archæologists. It was by some supposed to be near the Secretarium Senatus, where the decisions of the Senate were given, and the Tabernæ, where "a flesher on a block had laid his whittle down," which was caught up by VIRGINIUS and used to smite his daughter. To increase the difficulty a still more ancient Basilica Æmilia stood in that part of the Forum. The church of St. Adrian was by many archæologists taken as a successor to the Basilica, but the building is now considered to be not older than the fifth century. Opinion is now generally in favour of the theory that the building erected by L. ÆMILIUS PAULLUS was on the site of the so-called Fiori houses. In order to settle the question, Mr. LIONEL PHILLIPS has given 2,400*l.* for the purchase of the houses, on the condition that they are to be taken down and the site excavated within a reasonable time.

THE returns relating to the cost of the works for the completion of the harbour at Madras will probably be considered more amusing than instructive by engineers and contractors in this country. Indian workmen and labourers are sometimes said to resemble machines, but no machinery known to us could come so close to anticipated results. The deposit of rubble at the north was estimated to cost 24,378 rupees; the cost was $24,377\frac{9}{16}$ rupees. For setting blocks the cost agreed with the estimate, or 1,05,569 rupees. The north pier caisson cost about one-sixteenth of a rupee less than the estimate. At the south pier, for depositing ordinary rubble, there was no difference between estimate and outlay, and the like phenomenon was witnessed in the setting of blocks. The deposit of large rubble cost three-sixteenths of a rupee less than the estimate. In no case was there the smallest increase over estimate. The works committee of the London County Council may well ask themselves, "How was it done?" It is mysterious, but it puts to shame the blundering efforts at Spring Gardens to compel estimates and outlay-returns to agree. Why not send the committee and all their officers to Madras to discover a solution? It is at least certain that, however long they remained in India, they would not be missed in the Metropolis.

IT is believed that the Guildhall of Exeter contains parts which have existed since 1466. The very remarkable front is, however, Elizabethan, and is not older than 1593. Restoration of the front being considered necessary, the estates committee of the Council recommended that a contract should be entered into for the work. The proposal having come under the notice of the Society for the Protection of Ancient Buildings a protest against the arrangement was sent to the City Council. It was explained that contracting for a work of the class must necessarily result in great extravagance as well as destruction. It was only as the work proceeded that what was needed could be ascertained. Although the Society could not inform the Council what the cost of the repairs would be without a specification describing what was necessary, it was recommended that only such work as was needed should be done, and only what was done should be paid for. Contracts should be avoided in order to effect that arrangement. The inteference of the Society has in many places made public bodies more determined to carry out what was proposed, but in Exeter a better spirit prevailed. The wisdom of the suggestions was appreciated, and it was decided to adopt them.

WHEN A. W. PUGIN was appointed professor of architecture at Oscott College some half-century ago, he poured out all his scorn, and it was abundant, on the church of St. Mary's, Moorfields, which at the time was the most important of those belonging to Roman Catholics in London. He compared the front of the sanctuary to the proscenium of a theatre. PUGIN was anxious to convince the young ecclesiastics that Gothic alone was worth their attention, and no other style was to be adopted by them in the churches they would be called on to erect. He did not take into account the difficulties which had to be encountered in the erection of such a church in London at a time when the funds were mainly contributed by poor Irish labourers. What was then sought was a large building, and the immense painting behind the altar was more pleasing to the humble congregation than would be one of RAPHAEL'S works. The building of late was placed in a precarious condition by subterranean works of the city, and although an immense sum was expended on under-pinning, there were apprehensions about its endurance. The alterations in the district have driven the classes it used to accommodate to other localities. Although the church was a memorial of many sacrifices, and was rich in associations of a transition period in ecclesiastical affairs, it was wise to accept the inevitable by selling the building. The price, it is said, was over 200,000*l.* In such cases it is usual to expend the purchase-money on new buildings, and Catholic churches are required in several parts of the Metropolis. But there may be other calls which must take priority, and the sum available for building is not unlikely to be more modest than is expected.

ILLUSTRATIONS.

LE CONCERT CHAMPETRE.

THE picture we reproduce was at one time in the Collection of CHARLES I. The king had purchased it with other works belonging to the Dukes of MANTUA for 80,000*l.* The Mantuan Collection was considered to be the finest in Italy. On the death of the king it was decided to sell his pictures and other works of art. Among the largest purchasers was JABACH, a banker of Cologne, who at the time was living in Paris. He was rich, and could afford to pay liberally for any work that pleased him. JABACH was not more secure against reverses than other speculators. He was compelled, in consequence of losses, to sell his treasures. Most of the pictures which he derived from the collection of the English king were bought by Cardinal MAZARIN. On the death of the Minister LOUIS XIV purchased from his heirs no less than 546 pictures. Subsequently he acquired some other collections, and in this way the "Cabinet du Roi" was formed. Among these were eight works by GIORGIONE, but the Louvre now possesses only two, the most important being the *Concert Champêtre*.

XVIII.

Dijon.

[Y way back to Vespers at St. Benigne led me past a very extraordinary church, St. Jean. Desecrated until 1872, n it was reconsecrated after undergoing restoration and emshment, this church forms an important factor in the archiıral group viewed from the railway, and in many respects be looked upon as a model for a large town church, consistıs it does of a very wide nave without aisles, transepts, and ncated eastern limb flanked by square towers. An impresof great religiousness is created upon entering St. Jean ıe disposition of its windows, all of which are placed high ı their respective walls, leaving a great space, which has ented an advantageous field for polychromatic display w. It struck me that Mr. Bodley must have had St. Jean ijon in his mind when designing that noble town church of alvador at Dundee.

he tracery in the windows at St. Jean is early Flamboyant, ood. Two windows of three lights apiece, with a rose arly traceried above, serve for the west front; the principal of each transept is similarly fenestrated, but the windows ng the nave are simple lancets. Below these are very plain arches opening into separate chapels. A grand on roof covers nave, transepts and short chancel—this by the way, was reduced to its present dimensions in —and the roof at the crux meets in a great wooden corbel or ant. There is no east window, but the wall space above gh altar is frescoed with scenes from the lives of the two hns and a representation of the Eternal Father. Bossuet, p of Meaux (1681-1704), a native of Dijon, was baptized s church, which until its restoration to sacred purposes d the Marché du Midi. The adjacent St. Philibert, used ay store, is a fine example of Burgundian twelfth-century having that localism, the western narthex. The Romandoorway on its south side is a good specimen of the and the lofty octagonal tower and crocketed spire play a important part in the architectural ensemble of Dijon.

he bell of St. Benigne had ceased to toll, and the canons inging None in choir, when, shortly after three, I passed the western porch and pushed open the door, from which t flight of steps conducts to the nave of this Middle d cathedral.

e dimensions of St. Benigne are not vast. Originally ctual, it became, on the re-establishment of the hierarchy ance early in the present century, the Bishop's seat, the r cathedral having succumbed to revolutionary fury. Cruci n plan, it is distinctly Burgundian in its details. These are ally graceful in the transepts and short one-bayed apsidal n limb, in whose windows, by the way, we strongly deside painted glass. There is no procession path, but its side s open to apsidal chapels east of either transept. Of these uthern one is most gorgeously decorated with colour and d-glass, and contains a good modern Gothic altar. By y, the use of Benediction created—now some fifty years a revolution in the *instrumenta altaris*. Almost uniy in France, over the altars placed in restored chapels hedrals and churches, stands a closed tabernacle sured by an open baldachin, canopying over the mon, which again soars up into pinnacles and turrets, g to combine the movable monstrance and ciborium, anish metallic custodia, the German *Sakramenthaus*, and lian baldachin.

ometrical tracery prevails in all the windows of the choir ansepts of St. Benigne. Those in the lowest stage of e are of two lights apiece; the upper ones have three. ansept has a noble window similarly traceried, and placed gh up in its wall. From clusters of reed-like shafts, all xquisitely foliaged, spring the arches of the crux, not as at Notre-Dame, where it forms a lantern, but atly light and elegant.

I was much disappointed with the nave. It is later and very inferior in its workmanship, while the absence of cusps to the lights and of foliations to the circles composing the tracery of its clerestory windows, imparts an impoverished air to this part of the church, which is, however, enriched not only by the statues bracketed upon its pillars after the Belgian manner, but by the gallery and case of the western organ, which makes a very imposing show.

The external feature, *par excellence*, of St. Benigne, its tall needle-like spire of local celebrity and known to me by engravings, had disappeared, together with the whole of the nave roof, for purposes of "restoration." I trust, however, that this interesting and picturesque old spire will be replaced entirely on the old lines, and that no fanciful modern erection will supplant it, as was the case at Notre-Dame. A pair of octagonal towers with tiled pyramidal cappings flank the western façade. One of these low spires has had its old sober, time-coloured tiles replaced by new ones. Their flaunting green and red patterns are most offensive, and this, I suspect, is what is taking place with regard to the roofs of the cathedral generally.

The contrast between the roof of the tower which has been renewed and the one still retaining its old tiling is too striking to be overlooked. There is a very fine western narthex. The arch opening into it from the street has a single row of arcades above it similar to that at Notre-Dame, but very much later in style. A lean-to roof connects it with the west front, whose window, now bricked up, exhibits a curious sort of debased plate tracery devoid, like the clerestory, of foliation.

This spacious narthex afforded an admirable retreat from a very heavy storm which passed over Dijon during the afternoon offices. The afore-mentioned portly priest and his party of ladies were among the imprisoned here, and frantic were their efforts to invite the attention of the drivers of sundry "flies" which occasionally scudded by with their "fares" snugly boxed up inside. At last, however, they succeeded in securing an empty vehicle—a ramshackle-looking affair, by the way—into which they packed themselves, and drove off to the ducal palace, which, it appears—being on a visit to Dijon from some country fastness—they wished to lionise. Taking advantage of the contiguity of St. Benigne to the railway station, I fled thither as soon as the rain had somewhat abated, and got some food in the buffet. Here, while making inquiries respecting the departure of the evening train for Autun, I attracted the attention of an Englishman seated at an adjacent table. And now, positively for the first and only time during this tour, was I enabled to converse in the mother tongue. Learning my destination, my compatriot inquired whether I was bound to Autun for the races. No! my visit to Autun had quite a different object. Learning what this was, my newly-found friend called for writing materials, and thereupon indited for me a letter of introduction to the President of the Society of Antiquaries at Autun, which, although its addressee was away from that city at the time of my visit, proved exceedingly helpful in procuring admittance to places not ordinarily accessible.

By the time the repast and an agreeable chat was finished, courtesies and cards exchanged, and so on, the storm had passed over, and when I sallied forth for another hour's ramble about the city the sky was quite clear, and Dijon had assumed quite a different aspect. Haunted by Notre-Dame and the western façade of Saint Michael, I paid each another visit; peeped through a chink in the door of the desecrated St. Etienne—an eighteenth-century church built in admirable imitation of Romanesque; sat for a brief space in the cathedral, where a cough or the shutting of a door alone broke the silence; retraced my steps to the railway station, reclaimed my knapsack from the garçon of the buffet, and, knowing what French trains are on a Sunday night, wisely secured a seat in the corner of a third-class compartment.

The journey from Dijon to Autun passed through various phases, and was sufficiently picturesque and amusing. At first it lay *viâ* Beaune, whose church and ideal Hôtel Dieu I deeply regretted my inability to visit, through the vineyards district, along which the summer twilight began to steal, long after the last rich crimson glow of sunset had left the towers and square

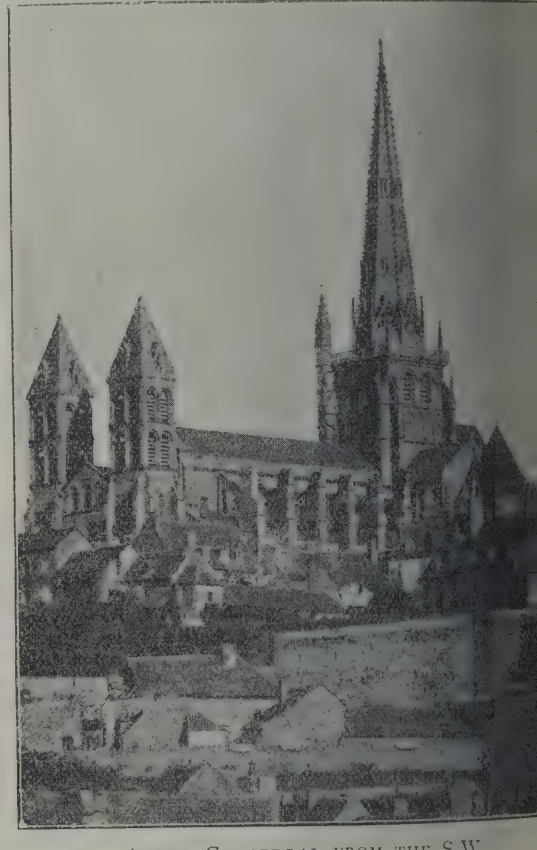
spires of its thickly-set village churches cold and grey once more.

As far as Chagny—where carriages must be changed for Autun—the journey was pleasant enough. But at Epinac, where some military manœuvres had been taking place, there came an irruption, and the remainder of the ride was performed under such discomfort that, after a mental resolution never to travel on Sunday night in France again, I was relieved to hear vociferated along a dimly-lighted platform, "Autun! Autun! tout le monde descend!"

The crush getting out was fearful, but these perils overcome, I climbed to the box-seat of the omnibus belonging to the Hôtel des Négociants, my request as to whether I might do so having been met with a polite "Oui! oui! Monsieur; oui! oui! si vous voulez!" from Monsieur le Cocher.

As we drive through Autun its streets are as silent as the grave. The barking of watch-dogs behind the *porte-cochères* alone breaks the stillness; lights here and there in the upper windows of houses betoken that their inmates have sought the regions of the drowsy god; and the sweet smells wafted down from the thyme-clad hills under which the city nestles, mingling with that arising from the freshly-watered earth—for rain has been falling heavily here, as at Dijon—greet the olfactory nerves in a manner doubly welcome after the confinement of the railway carriage. A few people are sitting before the cafés in the great market square as, just upon the stroke of ten, the omnibus rumbles over its stones, presently depositing me at the bureau of the Hôtel des Négociants. This is a typical French house, with a most affable proprietress, "une vraie dame," as a more than ordinarily communicative *commis voyageur* remarked to me on the following morning while partaking of an early bowl of *café au lait* and bread and butter in the privacy of Madame's sanctum, the *salle à manger* being in the hands, or to speak strictly under the feet of, the *frotteurs*, and therefore not available on this occasion.

A Day at Autun.



Roquette dans son temps, Talleyrand dans le nôtre,
Furent les évêques d'Autun.
Tartufe est le portrait de l'un:
Ah! si Molière eût connu l'autre!

Evidently an atmospheric depression is passing over the Autunois district of Burgundy, for when—shortly after seven on the morning of Monday, July 30—I throw back the jalousies of the bedroom window at the Hôtel des Négociants, the sky is gloomy and overcast. Arriving at dark on the previous evening, I had been unable to distinguish the environments of the inn; now I perceive that it lies somewhat removed from the market square, being approached therefrom by a *porte-cochère*; while from the fact of several droves of sheep passing beneath my window, I assume not only that it is market morning, but that the road is a public one, and forming, as I found later in the day while on a tour of inspection, a short cut from the market square to the upper part of the old city.

As I leave the hotel for an early ramble I encounter the *décrotteur* of the establishment—Jules, who, by the way, after ushering me to the bedroom with the regulation candlestick on the previous evening, quitted that apartment upon wishing me 'Bon soir" with one of the grandest dancing-masters' bows conceivable—I encounter Jules, I say, who, returning from executing some commission or other in the city, greets me with a pleasant "Bon jour, Monsieur! voilà! les moutons et les bœufs," as though sheep and oxen were animals perfectly beyond my most acute conjectures as to their anatomical construction.

The immense market square is a moving mass of sheep, who invade even the steps of a gaunt-looking church, which frowns with Classical severity upon the crocketed Gothic spire of the cathedral as though in reproof of its lightness. The oxen, noble-looking creatures with great mild eyes, are yoked together in a line, below a species of raised causeway common in the markets of this part of France; while underneath an avenue of trees, on the same side of the square as the hotel, are ranged stalls, upon which is heaped the *omnium gatherum* of domestic articles usually seen in such places. Above all this, rising with a background of gently undulating hills, is seen the iron-grey spire of Autun Cathedral, towards which, having exhausted the intoxicating pleasures of the market plac make my way. The streets are steep and cobbled—fe places to ascend on a hot day in tight boots. If, however, should have the misfortune to visit Autun *chaussured* thus will find a easy cut from the market square to the prin street *viâ* an avenue of shops—a forlorn-looking place, g one the idea, to take a home illustration, of the Lowther A when it shall have fallen on evil days. Like the celeb portico at Cambridge, how such a place got into Autun difficult to conceive. Not a quarter of the shops seemed tenanted. Up the winding streets you go until presentl emerge upon a roughly-paved and, if I remember rightly, g grown square, whose south side is occupied by this smal very interesting cathedral, its crocketed spire and Flamboy fenestrated aisles giving, at a first glance, the idea of a building, little preparing you for the simple, solemn sitional character of its interior.

Like many churches in this part of France, the cathed Autun is dedicated to St. Lazare, first Bishop of Mars Until early in the twelfth century, when it underwent exte structural changes, it had for its patron St. Nazaire—an of Lérins, near Cannes, in the fifth century, and said to been a disciple of St. Honoratus, afterwards Bishop of It is almost needless to say that the legend of Lazarus h been first Bishop of Marseilles has nothing but the gr credulity for its support. The cult, however, grew, and had its influence on the Gallican Church. Lazarus, M and Mary, the legend runs, came to Marseilles, driven fro Holy Land by the persecution of the Jews. Martha was b at Tarascon, Mary at Marseilles and Vézelay, and Lazar Autun. Thus it came about that, upon the rebuilding

Autun Cathedral from the S.W.

old basilican cathedral in the twelfth century, it was that the bones of Lazarus must be somewhere in its p whereupon it was rededicated, no longer to St. Nazair Lazarus who was raised from the dead.

And here are the three figures, Lazarus, Martha and the first in episcopal vestments and mitre, set up *d* fashion against the central pillar of the great wester which after the Burgundian manner is covered by a projecting porch with three open arches, very southe treatment. Above the narrower arch on either side ris severe-looking tower capped with a short square st (no alliteration is intended). The portal is situated at of a flight of steps formed within the porch, which, by

not be confused with the great narthexes or *porches des humènes* found at Vézelay and Tournus, and whilom at . This situation imparts to the west portal at Autun than ordinary grandeur and dignity, though unluckily the nity of houses to the west end of the cathedral does not a really satisfactory view of the whole composition to be

style this western portal of Autun is richest Romanesque. of its features, notably the three slender shafts from

AUTUN: WEST DOOR OF CATHEDRAL.

c the great arch springs, betray a very strong Byzantine i , like all southern French Romanesque; while in the e pilasters on which the lintel rests it is impossible to over- e influence which, as we shall see more distinctly when g inside the church, the architecture of existing Roman a is has had over this noble piece of twelfth-century work- a ip. Grand but wild is the composition in the tympanum. w s customary, this space is filled with a representation of

the Last Judgment, into which are introduced several devils of colossal proportions and of appalling aspect, who are seizing and tormenting the figures of the condemned. An equally exaggerated figure of St. Michael weighs a soul and protects it against the combined efforts of two of these demons, who endeavour to press close to the side of the bearer of the scales. These are to the left hand of our Saviour, Who is seated in an aureole with both arms extended. The head is gone, but the cruciform nimbus remains. To His right are the blessed. A row of small figures, in attitudes corresponding with the two divisions above, form a species of frieze in the lintel, and deserve study for the varied expressions which the sculptor, whoever he was, has thrown into them. During some miserable alterations which were inflicted upon the cathedral towards the close of the last century under the influence of the Maréchal de Richelieu, a friend of Voltaire, this rich sculpture was daubed over with plaster. This was so far fortunate, since the plaster

has all been scraped off, and the whole work, with the exception of the head of our Saviour, has come down to us in a marvellously complete and well-preserved manner.

I may mention, *en passant*, that I was lucky enough, though not without much search, to secure a photograph of this fine doorway at Autun. The lofty flight of steps inside the great porch is rendered necessary by the slope from east to west of the ground on which the cathedral is built, a natural cause which, while it contributes in no small degree to its great picturesqueness, assists in imparting to the mass an air of greater size, for in dimensions the cathedral of Autun is one of the smallest in France. Windows of very good Flamboyant character (1460-70) light the aisles ; heavy flying buttresses give importance to the untouched clerestory ; a fine but sculptureless Romanesque portal admits to the north transept, and a low, late Gothic tower with one large pinnacle at its north-west angle, and smaller ones rising from its enriched parapet, rises above the intersection. This is crowned by a tall crocketed spire, recalling Norwich, though the steeple in the mass is more suggestive of Lichfield. At Autun the spire rises from the middle of the "squat" tower without broaches or clustering pinnacles at its base, but the impoverished appearance of a spire in this position is in some degree redeemed here by the cusped and arcuated pediments, of which there is one on each side at its base.

There is a short eastern limb of two bays ; but, conformably to the Burgundian method, no circumambient aisle or radiating chapels. I shrewdly suspect, however, that neither the three-sided apse to the choir nor that terminating either aisle is original work, but an architectural forgery of the Flamboyant epoch, and this suspicion is confirmed when on passing into the interior I observe that modern Late Pointed glass of a very thin and jejune character has been inserted in the windows of each apsidal termination.

The similarity which the ensemble of the interior of Autun Cathedral bears to that of Langres—a later copy on a grander and broader scale—is too striking to be overlooked for an instant. The nave (c. 1130) is perhaps more *élancé* than that at Langres, and retains all its original features ; but the aisles have been greatly disturbed by the chapels thrown out from them during the Flamboyant epoch. Here are Pointed arches springing from fluted pilasters, and here is the same type of triforium stage, viz. three narrow round-headed arcades between Corinthian pilasters, the simple clerestory of one round-headed window to each bay, and the barrel-vaulted roof spanned at the interval of each bay by a broad unmoulded rib. Although some of the details of the interior of Autun Cathedral—notably the capitals of the nave pilasters—do not present so thoroughly Classical an appearance as those at Langres, it must be accepted, since the magnificent pile of Cluny Abbey fell a victim to private cupidity, as an excellent specimen of that peculiar type of Burgundian Gothic so often found in the Lyonnais district. Concerning this quaint admixture of the Classic element with the Transition of the twelfth century, I may just recall the attention of my readers to the fact that the remains of an earlier period have, at Autun as elsewhere in the Lyonnais, exercised a no inconsiderable influence on the growing Pointed style. "Some antiquaries," remarked one of our most eminent architectural critics, "have not hesitated to consider it a bad imitation of Gothic forms belonging to the fifteenth or sixteenth centuries. In fact, its fluted columns or pilasters, their Corinthian capitals and the whole arrangement are so eminently Classical as almost to justify the doubt in those who are not familiar with the history of the southern styles of France." There cannot, however, be a shadow of doubt that the peculiarities we observe in Autun Cathedral are traceable to the two noble Roman gateways still remaining in the lower part of the city near the railway station. I visited these remains in the evening, and the resemblance which the triforium range bears to the range of small arches alternating with pilasters in the upper part of the Porte d'Arroux—one of these gateways—is too striking for the theory to be doubted for a moment. In short, wherever these relics occur, as at Langres, Lyons, Arles, Nismes and Orange, there will be found in the churches in or contiguous to them some attempt at imitation, even in works belonging to a period in which the rules of the prevailing styles appear to have been definitely settled.

(*To be continued.*)

INTARSIA OR INLAYING.*

INTARSIA or inlays of wood, ivory, &c., one of the r interesting of the so-called "minor" arts, has prob suffered more both from its neglect and from its abuse any other method of decoration. At its best—kept w its proper limitations—no more delightful form of dec tion was ever devised. One must, however, be confronted a bad example in order to be able to realise how bad it become at its worst.

Probably every existing form of art or craftsmanship h some period of its development suffered through the t cleverness of its exponents. In painting at the present technique (especially in France) is worshipped for its own and what we think should be only regarded as a mea expression is set before the student as the end to be atta Intarsia, like every other art, is at its best when most i but except in the earliest periods of its development, its stu and makers were never able to resist the temptation to wa out of their proper limits in imitation of other arts. reason of the very earliest designers and craftsmen for kee simple and chaste in their designs and patterns did them credit, as they were probably purely mechanical reasons arose out of the dfficulty of producing elaborate work b only methods known to them at that time.

To a designer who has taken the thing up in the spirit, and who has gone to the trouble to make himself tolerably well acquainted with the resources of the cra would appear incredible that anyone should consider it n sary to go outside its proper limitations in order to imitate of the sister arts. The materials are so beautiful in themse so infinitely varied and so adaptable to his purpose, assuming him to possess even a small measure of ar instinct, his work is really half done to his hand befor draws or cuts a line. The decorative problems which pre themselves to the worker in intarsia for solution are fe compared with those of the painter or sculptor. For exa he has not to concern himself with surface technique Tone, harmony, and, in a limited degree, the sense of valu must certainly cultivate. He must also be able to draw or combination of lines which may be ingenious if you lik must be delicate and graceful ; vigorous withal, and in p relation to any masses which he may introduce into his d

He must thoroughly understand the value of contra line and surface form, but these matters, though a stum block to the amateur, are the opportunities of the com designer and craftsman—if by good hap the designer position to be the craftsman also. The most cha possibilities of broken colour lie ready to his hand merely selected by him, and introduced into his design yet, with these and other advantages peculiar to work i kind, the whole history of the art, so far as I can fol except in the earliest times, is a story of perverted inge the story of an art degraded more than any other b perverseness and want of taste of its votaries. Surely other art has the clever, sometimes exquisitely clever, man suffered so many things from the bad or perverted of the designer. Whether the craftsman has been his designer or has worked from the drawings of another one ; and it makes one marvel to find the most consum technical skill so frequently associated with that which is in taste and in composition.

I do not know the precise date at which the use of for furniture became general, but I have little doubt tha may be termed the "fatal facility" which this afforded craftsman must have suggested the over elaboration whi been practically impossible through the limitations impo the earlier methods. The earliest examples of inlaid viz. those in which the ground is cut away and the inserted into the solid wood will nearly always be found good of their kind. The work, from its nature, could done at the cost of much time and labour, and this, dou suggested to the executant the necessity for the elimina everything from the design which was not absolutely nec to the development of the motive, a condition of things always makes for good decorative art in any material.

I doubt not that the early workers in intarsia often w as the old builders are said to have sometimes builded, than they knew."

With the introductions of veneers or skins of wood complete change. The economical necessity for the re hitherto observed was removed, the smallest details be introduced into a design with comparatively little d or cost. Wooden pictures began to replace the former and appropriate decoration. All reserve was apparently aside, and the tarsatoir of the period revelled in the sentation of temples, gardens, figures in extravagant co with wooden bodies and sometimes ivory heads or face

* A paper read before the Applied Art Section of the Sc Arts, by Mr. Stephen Webb, on Tuesday, April 18.

riumph of craftsmanship and the decadence of design be followed through their various developments, in which rtist appears to have done his best (or worst) to outdo his cessor or contemporary worker in the extravagant use of s, proper only to the painter or picture maker, till it touched was perhaps its highest point of absurdity in the wooden sentation of whole towns, castles, &c., as we see it illus- l in the German work of the eighteenth century on panels chiefly for the interior decoration of cabinets.

he French work of the eighteenth century is every whit as vagant as that of Germany in another way. There is a table in the Jones collection at the South Kensington um, the top of which is decorated with Boule work (metal vory). In the plan of the decoration a band is used into n—and on which are introduced figures in the costume of eriod—curiously scalloped cloths, tassels, foliated forms, æ, caryatidæ — monkeys, squirrels, swags of flowers, ets of flowers, masks, birds (cranes), dogs, festoons ed of petals, cornucopiæ, and probably a few other rties more or less material to the scheme. If this of thing was ever worth doing (a matter about which I am y prepared to speak here), an excuse for it would surely be l in this table, which as a piece of craftsmanship, apart its design, is certainly one of the finest existing examples s kind of work.

ersonally I have never been able to get up any enthusiasm etal inlay for furniture. It is frequently very gorgeous, y always extravagant in design, seldom beautiful, and even has the fortune to get a beautiful design, it is generally lt to bring it into harmony with any colour scheme which have been adopted for the decoration of the room.

oreover, it is not easy to cut, though that is perhaps more tter of time than difficulty, and it is apt to leave the id when laid, which is a much more serious matter.

hese are only mechanical difficulties. The chief trouble, one which I confess I have never overcome to my own action, is in the selection of wood of a colour and texture shall at the same time contrast agreeably with the metal ces and harmonise both with the metal pattern and the ary colours used in the decoration of a modern room. I venture to recommend this problem to the notice of any y confrères who have the requisite leisure and experience empt its solution. The thing has never been done yet.

n studying French—and indeed all other marquetry work arly every period—the superiority of the workmanship to lesign is still constantly in evidence. In nearly every rtant example which remains it is plain that the executant, from being guided by the designer, has been led out of ay, the obvious result being a deplorable waste of skilful manship.

riously enough this want of taste shown in the selection ms suitable to the embellishment of furniture is some- , and indeed often, found combined, in the same cabinet, what one would fain believe to be evidence that the ner had the colour scheme perfectly, and could select the s suitable for his purpose, with the certainty of getting fect which he had in his mind. But the almost inevitable luction of these little bits of ivory again gives one pause, s one doubtful whether the harmony of colour in the s was not accidental, or the effect of time, as it would impossible that a designer, who had sufficient knowledge conditions necessary to produce so good a colour harmony e woods, could deliberately bring himself to introduce ing so obviously disturbing to the whole scheme as these bits of ivory always are.

is not until the close of the fourteenth, or beginning of fteenth, century that we find intarsia used for the decora- of large surfaces, nor, indeed, till then does it appear to been taken seriously into the consideration of artists or ssibilities recognised. Then we hear that Brunelleschi Paolo Vicello gave lessons in perspective and tarsia to tects and others, of which Masaccio, in his paintings, and detto da Majano, in his inlaid works, availed themselves. here are certainly to be found examples of the craft in the ivory boxes, ornamented with inlay of various coloured s, manufactured chiefly at Venice in the fourteenth ry.

cording to Vasari, one of the greatest names in the art is f Fra Giovanni da Verona, who, in place of the dark and woods of two or three tints only, used by the Majain, gave ial colours to his wood inlay by means of waters, coloured ons and penetrating oils. To obtain brilliant high lights s accustomed to use delicate slips of willow. F. Vincenzo Vache is mentioned by Marreli in his "Notizia" as excel- n such work, particularly in the church of San Bene- at Padua. Fra Rafaello da Brescia, of Monte to, ornamented the choir of San Michele. Sabba glioni, in his "Recordi Avvero Ammaccliamenti," in Digby Wyatt's essay on the subject, in "The trial Arts of the Nineteenth Century," mentioned egnaghi as good artists in this manner, and he speaks of the Dominican monk, Fra Damiano da Bergamo, the most celebrated of the sixteenth-century tarsatoii. "But above all, those who can obtain them decorate their mansions with the works, rather divine than human, of Fra Damiano, &c., who excelled not only in perspective, like those other worthy masters, Fra Giovanni and Legnaghi, but in landscapes, in backgrounds, and what is yet more—in figures, and who effected in wood as much as the great Apelles did with his pencil. I even think that the colours of these woods are more vivid, brilliant and beautiful than those used by painters, so that these excellent works may be considered as a new style of painting without colour, a thing much to be wondered at. And what adds to the marvel is that though these works are executed with inlaid pieces, the eye cannot, even by the greatest exertion, detect the joints." Thus the worthy Messer Sabba Castiglioni.

The colouring in this case was produced by chemical fluids, with the aid of burnt-in shadows. Damiano's best work, in which he was assisted by Fra Antonio Asinello, of the same monastic order, are not in colour, but are assisted in their effect by burnt shadows.

Other works of his are mentioned by Danzi, in the Dominican Church at Bergamo, and in San Pietro de' Casinensi, Perugia. Gian Francesco Capo da Ferro is spoken of as working also at Bergamo.

Other works in this manner are to be seen at the Certosa, Pavia, in the choir, executed by Bartolommeo de Pola in 1486; in the choir of the cathedral at Sienna, by Fra Giovanni da Verona; in the sacristies of San Miniato al Monte and Santa Croce at Florence, and in the Sala del Gambia at Perugia, the last being signed with the name of Marc Antonio Mercatelli. The tarsia work of artifically coloured woods which Sabba Castiglione so eulogises is not to to be found in any of the above-named works, and although the practice clearly originated in Italy it reached its ultimate development in France and Flanders.

Probably the inlay which in its character most nearly approaches that of the Damiano is the modern French work, so much of which is sent over to England in and for the decoration of pianofortes, &c.

It has nearly all the faults so conspicuous in Damiano, and where the modern Frenchman has missed any of the weaknesses apparent in the work of the Italian he has more than made up for it by those which he has invented for himself. Here is evident the same struggle to obtain the effect of painting, and an equal anxiety to conceal the joints which divide the various pieces of highly coloured woods introduced into the design. Indeed, the French critic of marquetry in these days makes this joining the test for good or bad work, and were a panel of intarsia submitted to his judgment in which the mark of a saw could be seen the work would be at once condemned as bad, though it exhibited all the finer qualities of design and cutting.

The experience of the writer is that the joinings of the various kinds of wood used in a design should not only not be concealed, but that they should be dealt with as frankly as possible, and that their utilisation in the design contributes almost more than anything else towards giving the work its character as intarsia or marquetry. It is true that the arrangement of the various pieces of veneer in a manner which will make the work of the cutter practicable and easy, and secure an artistic line for the joinings at the same time, calls for the exercise of some ingenuity, but this, though irksome and troublesome at first, soon becomes a habit with the designer for intarsia, or at least soon would do so if he understood its value. In nearly every example of modern work in which shading (generally produced by hot sand) has been resorted to, it has been abused. If the wood be properly selected shading is rarely necessary, and if it is done at all it should be done by an artist. It can never be safely left to a merely mechanical cutter of marquetry, even though he works from the most carefully finished drawing. In the hands of an artist very beautiful effects may be obtained by this process, the same kind of wood being made to yield quite a number of varying shades of colour of a low but rich tone, and that without any sacrifice of what, for lack of a better term, I must call the transparent quality so characteristic of all good marquetry work. Overstaining and the abuse of shading is destructive of this, one of the most valuable and distinctive qualities in inlays of wood.

Ivory has always been a favourite material with workers in tarsia, and, in the hands of an experienced designer, very charming things may be done with it. There is, however, no material suitable for tarsia which requires so much care and experience in its use. It is ineffective in light-coloured woods, and in the darker ordinary woods such as ebony, stained mahogany or rosewood, under polish, the contrast of colour is so great that the ivory must be used very sparingly; in other words, the designer must invent for his panel or border a pattern or design which, while containing very few elements, shall convey the idea of a satisfactory furnishing or filling (always a difficult problem for the designer to solve in any material).

In work intended for many other processes and materials, every artist has at times to consider the advisability of some such treatment as this, but it is seldom that he finds it so absolutely indispensable to the success of his work as in the application of design to the inlay of ivory for furniture. This kind of work is improved very much by age (the effect of light chiefly) even under polish. The ivory is sometimes stained in order to bring its colour more into harmony with a dark wood ground, but it is never quite satisfactory, and no one who had seen much old ivory in tarsia could be deceived by it.

There are conditions possible where—particularly in the decoration of furniture—the advantages are nearly all on the side of intarsia as compared with carving or modelling. The amount of time wasted, for instance, on very small carvings in dark-coloured woods intended to be used in furniture is incredible. The colour of wood, such as mahogany, walnut, &c., makes it impossible to see small carved detail in the various and varying conditions of light which usually obtain in a living room, and when, as so frequently happens, rosewood or some other strongly-marked wood is used for this purpose, the markings in the wood are so much stronger than the shadows by which the small carved forms are expressed that their effect is destroyed, and the result must always be confusion and waste of time.

Very small detail, especially in carvings, is introduced much more frequently than is necessary in furniture, as in architecture, and its introduction may usually be taken as indicative of some confusion in the mind of the designer or architect between smallness and delicacy. This idea, that scale or minuteness of detail must somehow be related to refinement or delicacy, absurd as it would appear to be to an artist, must really be very common to the designers of houses and furniture, or we should not see so much skilful labour and valuable time wasted in such useless productions. In this as in other matters it is only the thought or design in the thing which really counts; no amount of mere slavish though skilful labour undirected can possibly result in anything but disappointment, and there must be a very plentiful lack of direction in some of the places where modern furniture is decorated. If small carved details must be introduced into the external decoration of furniture they can only be certainly effective when plain and light-coloured wood is used, such as box, pear tree, &c., or quite black wood such as ebony (which has generally to be made black artificially), materials which have but little marking to disturb the surfaces and lines of the carving.

Undoubtedly the colour of these would render them in many cases unsuitable for the decoration of furniture, as they are apt to prove disturbing to the quiet colour effect generally associated with a living room.

It is here that inlay for the surface decorations can be made so useful in the solution of a difficult problem when it is done with judgment and taste. However quiet it may be kept in tone, and in good hands it is always quiet, however rich and varied in colour, it can always be seen, as it does not depend on the light for its due effect either in the same degree or in the same manner in which carving depends on it. I am not making general comparison between the advantages severally of carving and marquetry for the purposes of decoration, nor do I wish it to be for a moment supposed that I think marquetry can ever supersede carving for general purposes, even if the thing were desirable.

This is merely a protest against the grievous waste of time and of skilful, and frequently artistic, labour caused by architects and designers through their inability to grasp beforehand the idea of the modifications which will be brought about in the effect of their work by the conditions under which it will be seen. The decoration on small pilasters and capitals as applied to furniture and carved in these woods, is rarely seen at all, except on a rough and disturbed surface. Still more rarely can enough of the motive or details be made out to awaken any interest in it.

Assuming that about the same quantity of detail is introduced—which is usually the case—the carving on a pilaster 3 feet by 9 inches can be done as quickly and at no more, probably less, cost than the same design 1 foot 6 inches by 4½ inches, namely, half the size. There is no question of delicacy or refinement in this relation.

The inferior carver will inevitably give you a coarse and clumsy rendering of the small design, if you trust him with it. From an artist you will just as surely get a suggestion of refinement and delicacy pervading all the work in the large panel, though each man works from the same drawing or even the same model. Moreover, in the larger carving one is much more independent of the markings in the wood, by reason of the fact that the sinkings and shadows are deeper and stronger, and so in a measure, control the disturbing colour.

Apart from the question of cost which is always in favour of tarsia, there is this essential difference between the two methods, that while carving must always depend in a large measure on the direction of the light for its effect as carving (you can destroy the effect of carving which is in low relief at any time by a direct front light) the use of inlay makes direction from which the light enters the room a matter of moment, so long as the light reaches the object decorated.

I cannot close this paper without some reference to practice so prevalent among writers on art, and especi applied art, of comparing the conditions under which the was produced two or three hundred years past, with the ditions which obtain in our time. By no conceivable comb tion of circumstances can we ever get back to the condit under which those workers produced their work, and althe the productions of the writers above mentioned are freque pleasant reading they are rarely helpful, and indeed we artists or craftsmen, have but little concern with them must accept matters as we find them and do our best under changed conditions. Moreover it is so easy to write in way. The contrasts between the prevailing conditions those of the past are so sharp, the change so complete, th writer in this kind, possessed of only very ordinary ability, hardly fail to be at least picturesque. We are so freque told by poetical writers on art that a designer should, wher practicable, carry out his design himself in the materia which it is intended. No artist who has a design in whi really fine idea is embodied, need be told this; he would bably be but too glad of the opportunity to do this, assu that he had ever had the chance to obtain the requisite k ledge and skill in craftsmanship. His ideas are the childr his mind, born not without travail, and when it becc necessary to hand them over to strangers for their mat development, he does not part from them without a pang.

The modern designer, though he be really a master o own branch of art in all its details, must needs leave a g many of those details to other and more mechanical hands

SALISBURY CATHEDRAL.

A MEETING of subscribers to the Cathedral Tower Spire Fund was held lately at the Church H Salisbury, for the purpose of considering a proposal of committee that the balance of subscriptions remaining in hands after paying all expenses connected with the restor should be devoted to the required improvement of the c dral organ.

The Dean, who presided, said that after twenty years and tear the cathedral organ required to be thoroughly hauled and renovated, and it was very desirable that al modern improvements which had been invented during time the organ had been in use should be introduced int instrument. The work of overhauling the organ was o imperative necessity, and would involve a heavy outlay. Dean and Chapter would do as much as could be expect them with the funds at their disposal, and he could not thinking, when he remembered the interest taken in the c and the admirable results achieved with its aid at their c festivals, that many people would come forward and towards raising the necessary cost. He knew very well necessary it was for people to aid in efforts in this dire when so much was needed to be done to augment the Q Victoria Clergy Fund and promote other schemes for advancement of education and church building which we imperatively required in parts of that diocese; but still he h and trusted that they would ultimately be able to secure the object which they had in view. At a meeting held the pre week of the committee of the Tower and Spire Repair Fu was unanimously resolved to recommend the application balance remaining in hand on that fund to the renovatio improvement of the organ. In connection with the resto of the tower and spire of the cathedral, it would be imp for him to omit saying how very much the Cathedral Cl had been indebted to the exertions of their lay friends fro to last. The meetings of the committee had been adm attended, and most valuable assistance had been profer those lay friends. The perfect satisfaction which the had given was in great measure owing to their accomp and excellent architect, Sir Arthur Blomfield, and althou would have an opportunity at the approaching meeting Diocesan Synod of stating particulars of the way in whi money had been expended, it would be wrong of him not there, what he hoped might reach the public in some other, that he did not think it possible for any work of th serious as it was, to have been undertaken under more able circumstances. The amount of individual interest had been shown by all classes had been a very sur feature of the whole matter.

Archdeacon Lear said the cathedral organ had bee twenty-three years, and nothing but tuning had been d it for twenty years, during which period it had been in co use; therefore it was not to be wondered at that the inst required attention and renovation. The able builder organ, Mr. Willis, had been asked by the Dean and Cha

an estimate of what he thought ought to be done, and he divided his estimate into three parts. First, he thought an ıy of 400*l.* was necessary to effect needed repairs, 200*l.* e for the improvement of the choir organ on the south side e choir and bringing it up to date by providing the latest matic action, which was now applied to some of their t cathedral organs, especially St. Paul's and Lincoln, and her 400*l.* was required for the improvement of the organ ıe north side of the choir and fitting it with pneumatic n, making altogether a total of 1,000*l.* The committee assisted the Dean and Chapter in carrying out the great of restoring the tower and spire had happily 200*l.* at their)sal. It was really a sort of record that, after carrying out vork of restoration at a cost of 14,000*l.*, they had a credit ıce of 200*l.*, instead of a deficiency. The committee did eel justified in devoting that balance to the organ without ulting the subscribers, and therefore they had called that ing. The Dean and Chapter would be very glad if the cribers would say that day that they thought the balance, ctual amount of which was 210*l.* 10*s.* 3*d.*, might be applied e way the committee had suggested, and thus enable them ıcur the very considerable expense which Mr. Willis ght ought to be incurred.

recentor Carpenter mentioned that at a ruri-decanal ing of the Wilton Deanery held the previous day a ıtion approving of the proposal of the committee was ed unanimously.

r. Holgate then moved that the proposal of the committee vote the balance to the improvement of the organ should lopted, and, Mr. Morton seconding, the resolution was imously agreed to.

he following is an extract from a letter written by Mr. s to the cathedral organist, Mr. C. F. South, respecting the t:—

We have to commence this undertaking with a thorough ing and repairing its bellows (remaking some that have at work more than twenty years), and we have now to aul all its sound boards, replacing its springs, put new s and repair keys, at a cost of 400*l.*"

SHEFFIELD ART-CRAFTS GUILD.

NDER the auspices of the Sheffield Art-Crafts Guild an interesting lecture was given in the Howard Gallery on 2th inst. by Mr. S. Smith, chief librarian of Sheffield. ubject was "Craftsmen's Books on Ornament and Deco- Art." The master of the Guild, Mr. E. Tuck, presided, ı opening the proceedings said that a city like Sheffield ıded largely for its prosperity on the knowledge which its men had of the principles of art. The Guild had accom- d much, he believed, in improving the craftsmanship of ty, but they were yet only at the beginning of the work. were only just becoming appreciated by the "powers that If their work and objects were appreciated a little more, would see a great deal better technical work done in eld. They could only succeed by earnest effort, and he ıoping that under the wise guidance of Mr. Smith, the librarian, there would be added to the Free Library a er of volumes which would be of considerable use to men, and which would be perfectly free and open to them. Smith remarked at the outset that in a great commercial ınity like Sheffield, such a body as the Art-Crafts Guild ised a great influence for good in bringing about correct- of design, harmony of colour and accuracy of execution, in ıg craftsmen artists in the highest, and truest, and best sense word. It was a matter of the highest importance to crafts- hat they should have access to the best books dealing local arts and manufactures, and particularly those which, ason of their cost, would otherwise be quite out of the of the ordinary student. The provision of these at the al Library had been considered, and many both useful aluable works had been purchased. He was about to ask nsent of the library committee to publish a hand-list of ooks contained in the library to be sent to the members of uild and pupils of the School of Art, and if the publication at list drew attention to their wants and deficiencies it not be thrown away. Proceeding with his lecture, Mr. first spoke of general reference books, such as Owen s valuable "Grammar of Ornament." Subsequently he separately with works relating to costumes, ornamental work, furniture and woodwork, pottery and porcelain, and stained-glass, mosaic work, Japan and Japanese art, ecture and interior decoration, colour decoration, floral ation and design, figure drawing and sculpture, heraldry lumination, symbols and symbolism, book illustration and inding, &c. Under each head the lecturer dealt with ised works on the subject, giving a short bibliography of He referred to the plan adopted in Parisian libraries of iding works for the greater convenience of students, and ted that the "Selected Examples of Decorative Art" issued from South Kensington might be obtained for the library, and mounted separately to form a special collection to be loaned to craftsmen. He also suggested that it would be a good thing if an important body of working artists like the Guild should have direct representation on the libraries committee.

A cordial vote of thanks was passed to Mr. Smith for his lecture.

GLASGOW ARCHITECTURAL ASSOCIATION.

ON Tuesday evening, April 11, at eight o'clock, in the rooms, 187 Pitt Street, the president, Mr. Geo. S. Hill, A.R.I.B.A., in the chair, Mr. John Arthur, of Glasgow and Ayr, read a paper on "Feuing Plans and their Preparation." The essayist, in introducing his subject, referred to the fact that in cities this class of work was generally placed in the hands of civil engineers and surveyors to carry out, a state of things for which, he thought, architects themselves were largely to blame from their lack of interest and in many cases incompetency for the work. He submitted, however, that with regard to the plotting out of country estates for feuing purposes, the architect from his architectural training and experience was the one best qualified to judge how to take full advantage of their natural beauty and surroundings to give to their prospective roads and houses their highest degree of picturesque aspect and utility, and he exhorted those present to take a greater interest in this work, and to follow more closely in the footsteps of their country brother architect in this respect. The essayist then referred to surveying and levelling as being two necessary qualifications of the estate architect, and proceeded to show in detail by illustrations and demonstration how to survey and level a piece of land, and the use of the various instruments required for that purpose. This led up more particularly to the subject under review, and he went on to describe what steps were necessary to be taken with regard to the preparation of feuing plans for large estates, using Government ordnance maps as a basis for that purpose to show how and where to lay off new roads to best suit the arrangement and requirements of feus, how to take levels along the line of old and new roads, and how to reduce their levels to a common ordnance datum. The paper was fully illustrated by large scale drawings and examples of feuing plans. A vote of thanks to the essayist brought the meeting to a close.

TESSERÆ.

Difficult Sites.

ALL good artists welcome with pleasure what is called a difficult site. In truth there is no site so easy to deal with. It is when the site has no marked features of its own that the architect must make those of his own work prominent. The Acropolis of Athens and the Forum Romanum of Rome are in one sense difficult sites. That is, they are so picturesque, so irregular in their levels, that everything has to grow out of the necessities of its situation. There are no lessons more useful than those which we may learn from such examples as these. The Greek added one building to another in an almost picturesque confusion, and in a mode in which, if we believed some of our teachers of a few years back, it is impossible for any but the most erratic Gothic architect to take any pleasure. The Roman made a winding and irregular descent from the Capitol, with buildings of wholly dissimilar style on either hand as he descended, and then when he had passed through the arch of Septimius Severus, and found himself in face of a straight road for a short distance, he took care that it should be occupied by a succession of irregularly-placed and designed columns, monumental pedestals and buildings, whose beauty was that which came from the individual character of each, as well as from the gradual growth of the whole and the evidence it afforded of the historical continuity of the community and its arts. Nor when the Forum was left behind, and but a short distance separated the Roman from the Coliseum, was there any care to secure a straight road from one to the other. The paved roadway meandered on under the Arch of Titus, suiting itself to whatever conditions existed, in the easiest fashion possible, and without any thought whatever of those necessities for formal setting out of cities which are only reasonable when, as in many Transatlantic examples, there is no history whatever to be recorded, and a whole town is laid out at one time, and completed almost as soon as laid out. There are cases in which, however, the wise architect endeavours not only to build to suit his site, but to make the peculiarities of his site suit some sumptuous and scenic laying out of his whole building.

Hogarth's Accessories.

The lowest caricaturist is he who contents himself with the burlesque of feature, an offensive and ill-natured style. The next higher is the caricaturist of character; but the highest is the caricaturist of thought. This was Hogarth's superiority.

He threw on canvas or copper representations of all the eccentricities of mind. Sometimes tragic, as in his view of Bedlam; sometimes comic, as in the election print, where he exhibits popular folly under the image of a man cutting down the lamp-post on which he himself is sitting. Sometimes gravely satiric, as in the country church, where he exhibits the spider's web thickly drawn over the aperture of the parish poor-box, or in the picture of the nobleman's marriage with the rich citizen's daughter, where the gouty peer has the coronet upon his crutches, and the citizen's house is seen building, in defiance of all taste, with the Tuscan order above the Corinthian. But Hogarth's touches of nature and satiric dexterity are as numerous as his pictures. He loved common life, but its vulgarity is forgotten because his pencil was the most graphic, vigorous and true. One of his sources of superiority is the constant fulness of his background. Other artists have been content with the main action, thus leaving their performances naked, feeble, easily looked over and easily forgotten. But Hogarth crowded his canvas with accessories. Nothing was omitted that could assist the leading impression. He suffers no space to be unoccupied. Wherever there is room for an idea there an idea is fixed. In the *Marriage à la Mode* the profligate nobleman coming in from his night rambles might have been represented by a hundred artists in the exhausted plight in which he flings himself on the chair in his pompous drawing-room ; but how few would have thought of the tale told by the cap hanging from his pocket ; or in the picture of the miser's heir coming into possession, who else would have thought of the money dropping from the hoard in the wainscot? It was this unfailing fertility of invention, this richness of accompaniment, this heaping of image on image, that made Hogarth so powerful in his own day, and makes him so popular in our own. This was the result of study. Nothing permanent was ever done without long and anxious toil. And if Hogarth wrought rapidly there can be no stronger evidence than this peopling of his pictures with ideas that he thought with matchless industry.

Foliated Arches.

From the invention of the arch to the middle of the eleventh century no other form of it was used except the semicircular and segmental. About this period license was taken to alter the forms of arches: the pointed arch was introduced, and with it a variety of other forms, as ogees, horseshoes and ellipses. At the same time there came in the practice of foiling arches—that is, of uniting a series of three or more by their bases so as to form one, which is termed a trefoil, quatrefoil, cinquefoil, and so on, according to the number of its component arches or foils, as they may be termed. These foils may be either of the same or different forms, but are generally of an odd number, with one in the centre and the rest disposed in similar pairs on each side of it. They are often all circular or all pointed, and sometimes all ogees. An ogee or pointed between two circular foils is a very common arrangement; the lower pair are commonly imperfect semicircles, from their being continued downwards to form the sides of the arch, but in some of the earlier examples are made complete semicircles. The pointed arch, from its united strength and convenience, of course assumed the prominent place, and was used in all the larger and essential parts of the fabric, while the other forms were reserved for the decorative arcades, the galleries, doors and windows. These arches when at first introduced were treated in composition exactly in the same manner as the circular arches had been, and were mixed with them. The other characteristics of the Pointed style were invented before or after their introduction, and may be traced from their first imperfect germs to their final perfection entirely amongst European buildings, so that the notion of the Pointed style being introduced complete is at any rate erroneous.

Variations in Taste.

The cultivation of the eye is as necessary to art as of the ear to music. Art is not wanted for daily use in this bustling world, nor is poetry, nor any high reach of intellect. But the nerves of all our organs, our outward senses, do reach to the inner mind ; but the mind must by intellectual cultivation, or an intuitive and rare gift, be enabled to play upon these instruments. So that we are indeed wonderfully made, that we may never lay ourselves down and cover ourselves with the rust of idleness ; but, after we have exercised successfully the faculties necessary for our subsistence, those of highest power remain to be cultivated, and the means of enjoyment infinitely enlarged. Perfect taste is the enjoyment of perfected beings. We are afraid we are more than on the borders of dull truism, but we cannot come to the "why and wherefore" of things otherwise. Apply what has been said to our national taste and practice, as artists or admirers. What is the character of things exhibited? —here you have the aim of the artist. What is the character of the things admired, encouraged and purchased?—here you have the public taste. How far the one depends upon the other may be a question for philosophical inquiry, and not unw attention. It may be more than an object of curiosity to to causes facts in the history of taste, or, if you please, of we say taste because it comprehends the world to be pleas well as the artists who are to please—how it is that unvalued in their own age in a subsequent age are everyt how it is that the most valued become worthless. Are we that the present estimation of the works of other days, o great masters as they are called, is on a correct scale even here there is no steady certainty. Whoever lived twenty years in the world of art must noticed the variation of the scale, and then c a still more curious inquiry—are modern works received favour for and upon the same principles of taste which given their value to the old? or if not, can there be opp principles of taste? And then from what cause or happy bination of causes is it that in any age the genius of the the painter, maker, worker, shall have been in perfect and sympathy with the public requirement? Is there a an accordance between a people and the state of art a them? If so, how is it that the works of one age so admi suit another in which no such works originate? And as t present age, where the works which have been recognise the excellence of former days reproduced as originals a us, would they be acknowledged to be what they are? history of the world of events has been written, fabul and truly, with great learning and research, but the histo the world, intellectual and moral, of nations separate warfares and dynasties, is yet a desideratum—the histo taste.

Vitruvius and Mouldings.

Vitruvius has not written expressly upon mouldings merely names them when they occur in the course of description of other architectural members. But a name in this way be given to a moldings, either in the general s from the form of its section, as when he terms the hollo casement a scotia, from the shadow which it holds; o name may be assigned to the moulding only from the pec function which it performs, or from some form which it de from that function: as for example, the same scotia wh occurs in the base of a column is also termed in conjun with its fillets Trochilus, the pulley, for it exactly resemb pulley in this use of it, but not when it is straight. Now we attempt to pick out a nomenclature from this author, w often in a doubt whether a given term be a sectional name functional name, and this distinction has not been sufficie attended to. It will presently appear that the same funct name may be given to two different mouldings, if they are capable of performing the office to which the name alludes

GENERAL.

Professor Banister Fletcher lectures this evening "Sanitary Building Construction," at University Build Dublin.

Mr. G. F. Hill, of the British Museum, the Yates Lec in Archæology at University College, London, will deliv course of six lectures on the coinage of Britain, as illustra British history from the time of Julius Cæsar to the Nor Conquest. The lectures, which will be illustrated by the ele lantern, will be open to the public on presentation of visi cards. The first lecture will be delivered on Thursday, Apri at 5 P.M., in the botanical theatre of the college.

A Complete Set of the "Cries of London," afte Wheatley, R.A., finely printed in colours, with large mar and including the very scarce extra plate "Hot Spice Gi bread," engraved by Vendramini in duplicate, was so Messrs. Christie's on Wednesday. The set of fourteen was started at 150 guineas, and fell at Mr. A. B. Daniell's of 610 guineas. This is far higher than any price hitherto for a complete set of the "Cries," the previous highest am having been about 300*l.*

The South Kensington Museum in its enlarged will be called "The Victoria and Albert Museum." foundation-stone of the new buildings will be laid on May

Mr. Chamberlain, the Colonial Minister, has been el honorary member of the Royal Society of Painters in W Colours.

Mr. E. Tidman, F.S.I., has been selected an arc for the new schools which are to be erected by the S Board in the George Lane district, Woodford, and his have received the approval of the Education Depart Tenders will shortly be invited.

The Testing Station of the British Fire Preve Committee is already showing considerable activity, the in gations generally taking place on Wednesdays. Amon tests in hand are several with floors, and partitions ordinary description, as allowed by the Building Act, incl solid timber floors and floors with various aggregat concrete, all of which are, of course, not subject to any pa or the interests of any special firm.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must not necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

A great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. *on Thursdays.*

NEW READING CASE.

Librarians of the Public Libraries and Reading-Rooms.—A new handsome Reading Case can be supplied on receipt of nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITION OPEN.

WAKEFIELD.—June 30.—The Wakefield Industrial Society, Ltd, offers three prizes for the best architectural designs for new central buildings most suitable to meet their requirements. Prizes: (1) 50*l.*, (2) 30*l.*, (3) 20*l.* Full particulars at the Office, Bank Street, Wakefield.

CONTRACTS OPEN.

ALNWICK.—April 24.—For erection of a farm-steading, consisting of four covered fold-yards, feeding-pens, food-stores and stables for seventy-eight head of cattle and horses, and three cottages at Low Buston. Mr. M. Temple Wilson, architect, Alnwick.

BARNSLEY.—May 1.—For erection of a new school, class-rooms and lecture hall in Racecommon Road. Messrs. Senior & Clegg, architects, 15 Regent Street, Barnsley.

BARROW-IN-FURNESS.—For erection of the proposed new Congregational Church. Mr. E. M. Young, architect, 90 Duke Street, Barrow-in-Furness.

BARROW-IN-FURNESS.—April 28.—For erection of a technical school, and alterations to existing building in Abbey Road. Messrs. Woodhouse & Willoughby, architects, 100 King Street, Manchester.

BARROW-IN-FURNESS.—May 1.—For erection of new Cookery Centres at Rawlinson Street and Holker Street schools. Mr. W. Hutchinson, School Board Offices, Town Hall.

BARTON-UPON-IRWELL.—May 2.—For execution of certain private street improvement works, in the township of Clifton, in two contracts—1. Eleven streets, containing a total length of 690 yards; 2. Twenty streets, containing a total length of 1,482 yards. Mr. J. W. Whitworth, clerk, Union Offices, Patricroft.

BOURNE.—April 24.—For alterations to house, North Street. Mr. F. G. Shilcock, architect, Bourne.

BREAMORE.—May 1.—For construction of brick, concrete, and stone pier abutments, approach walls, &c., for the sub-structure of a bridge over the River Avon. Mr. W. J. Taylor, county surveyor, The Castle, Winchester.

BRIGHTON.—May 2.—For erection and completion ready for occupation of twenty-eight five-roomed artisans' dwellings, at St. Helen's Road, Brighton. Mr. J. C. May, surveyor, Town Hall, Brighton.

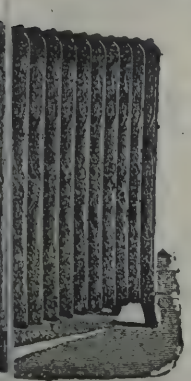
CHESTER.—April 29.—For erection of public baths in Union Street. Messrs. Douglas & Minshull, architects, Abbey Square, Chester.

CREWE.—April 26.—For erection of new Liberal club. Messrs. William Sugden & Sons, architects, Leek.

DARLINGTON.—May 8.—For erection of electric-lighting station. The Borough Surveyor, Town Hall, Darlington.

DERBY.—May 2.—For construction of a bridge in the parish of Cubley, on the road leading from Marston Montgomery to Hungry Bentley. Mr. John Barker, surveyor, Cubley, Derby.

DEVON.—April 29.—For erection of a cottage at Widewell, Torcross. Mr. W. F. Tollit, architect, Gate House, Totnes.



DUBLIN.—May 1.—For erection of an addition to the station building at Edward Street, Newry, comprising waiting-rooms, offices, &c., and a two-storey gatekeeper's cottage at Milltown siding, near Banbridge, for the Great Northern Railway Company (Ireland). Mr. T. Morrison, secretary, Amiens Street Terminus, Dublin.

WHITEHAVEN.—May 3.—For alterations and additions to the Oddfellows' Hall property in Lowther Street and Queen Street. Mr. J. S. Moffat, architect, 53 Church Street, Whitehaven.

APROPOS of a notice *re* paving in Upper Street, which appeared in our last week's issue, Messrs. Woolliscroft writes us as follows:—"We thank you for notice on page 3 of your issue April 14, but beg to call your attention to a mistake, where it is stated that the bricks are of a hard *red* pressed variety. If you will kindly refer to circular sent you, you will find it should be *blue*. Referring to the last paragraph, statistics from America, where they have been mostly used, show that they are most suitable where the traffic is heaviest, as they enable horses to draw with ease loads which on other pavements they cannot move." We find that both *blue* and *red* bricks were laid in the section of the road referred to, and that the latter were manufactured by Mr. Joseph Hamblett, Piesey Brick Works, West Bromwich.

THIS week's issue of Sell "Commercial Intelligence" contains a important map of Egypt and the Soudan, showing all the latest treaty boundaries, &c. An important feature of the paper is entitled "Foreign Goods we Buy," which contains some suggestive paragraphs and interesting trade facts.

IT is proposed to erect a mission church to accommodate 700 worshippers at the junction of Walford Road and Golden Hillock Road, Sparkbrook, Birmingham, where a site has been secured through the generosity of the trustees of the Birmingham Churches' Fund. The architect, Mr. W. H. Lloyd, has prepared plans, the estimated cost being about 6,000*l*. It is proposed that the church shall be built chiefly of brick, but such stone as is used for window tracery, copings, &c., will be of the most durable description. The site being short from west to east, the church has been planned proportionally, somewhat wider than usual, and advantage has been taken of this to group the greater part of the seats within a short radius of the pulpit, and to reduce to a minimum the number from which the piers will obstruct the view. The church will be designed in the Decorated style, will give accommodation for 707, and will comprise a chancel 32 feet by 24 feet, and a chancel aisle, organ chamber and vestry; a nave 86 feet by 29 feet, a south aisle of 19 feet width and a north transept, two porches and an additional exit from the transept. It will be known as Christ Church.

TRADE NOTES.

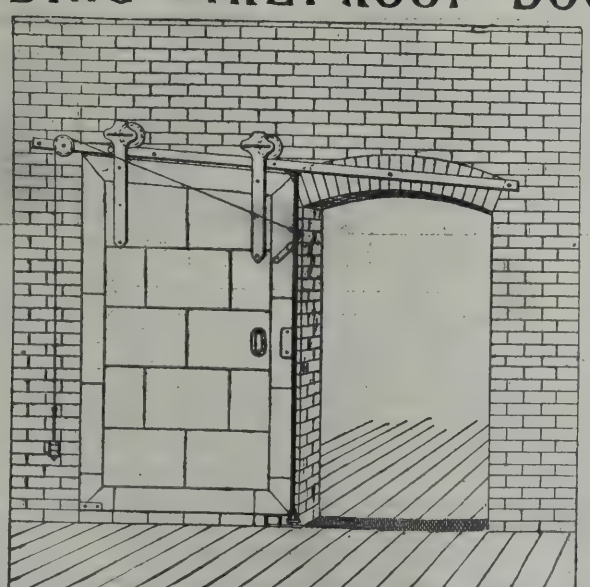
ıe Hambledon schools, Henley-on-Thames, are being ıtilated by means of Shorland's patent exhaust roof-ventilators l special inlet panels by Messrs. E. H. Shorland and Brother, Manchester.

There is a very simple hand contrivance invented by Mr ırryweather for augmenting the pressure in water fire-mains. is well known that in London, among the higher buildings, water companies' pressure is very weak in daytime owing the great domestic calls made upon the services. This ɔliance, which is designated "Merryweather's Pressure gmentor," when worked by one man, will raise a jet to a ght of 40 feet from zero with sufficient force to extinguish a on the roof of the most lofty building in London. The nstitutional Club, Queen Anne's Mansions, the Hotel Cecil l many other equally tall buildings are fitted with this nirable piece of apparatus.

In the Chancery Division, on the 15th inst., Mr. Justice Byrne ivered his deferred judgment in an action brought by the lsbach Incandescent Company, of Birmingham, for an ınction restraining the Daylight Incandescent Company n infringing plaintiff's incandescent patents. His Lordship l the only issue was one of infringement, there being no stion of validity, and he was satisfied upon the evidence t the defendants did use a process or method of applying illuminant cerium, a rare earth, so as to effect substantially same permeation and incorporation of the mantle as was cted by the Welsbach method. He granted an injunction, ı costs as between solicitor and client, and directed an ıiry as to damages.

THE BUILDING TRADES EXHIBITION.

This year's Building Trades Exhibition, which opens on the 26th inst., and will remain open till Saturday, May 6, promises to be, thanks to the energy and excellent management of Mr. H. Greville Montgomery, the most comprehensive of its kind which has ever been held, in this country at any rate. It will be divided into three distinct sections, which will be located as follows:—The General Section, which will occupy the Great Hall, the floor and gallery space in which is all allotted; the Electrical Section, a new development which seems likely to attract a large share of attention, will be lodged in the Minor Hall, adjoining the Great Hall; and the King Edward's Hall will be devoted to the Smoke Abatement Section, in which we may expect to find many exhibits of an important and interesting nature. In this connection we may mention that the committee of the Coal Smoke Abatement Society (Sir W. Richmond, R.A., K.C.B., chairman) offer a gold, silver, and bronze medal, together with certificates of merit for the best domestic appliances for abating the smoke nuisance. The design for the medal will be drawn by Sir W. Richmond, R.A.



The exhibition will be opened at twelve noon on the date mentioned by Professor Aitchison, R A. (president), supported by the Duke of Westminster, K G., Lord Welby, G.C.B. (chairman London County Council), Sir William Richmond, R.A., K.C.B., Sir Arthur Blomfield, A.R.A, Sir Arthur Arnold, Sir Alfred Hickman, M.P., Sir William Arrol, M.P., Sir Edwin Galsworthy (chairman Metropolitan Asylums Board), Sir Alex. Binnie (engineer L.C.C), Mr. Robert Vigers (president Surveyors' Institution), Mr. G. F. Fellowes-Prynne (president Architectural Association), Mr. J. W. Swan, F.R.S. (president Institute of Electrical Engineers), Mr. W. H. Preece, C.B., F.R.S. (president Institute of Civil Engineers), Mr. O. Claude Robson, M.Inst.C.E. (president Incorporated Association of Municipal and County Engineers), Mr. Alfred Waterhouse, R.A., Mr. T. Blashill (ex-architect L.C.C.), Mr. G. F. Bodley, A.R.A., Mr. Charles Barry, F.S.A., Mr. J. T. Bailey (architect L.S.B.), Mr. W. Goscombe John, A R.A, Mr. Gilbert Wood, F.R.G.S., and the leading architects in London and the provinces.

Arrangements have been made for visits on different days from the following institutions:—Surveyors' Institution, Architectural Association, Society of Architects, Institute of Builders, Municipal and County Engineers, and Sanitary Inspectors' Association.

GREENWICH ROAD S.E., & 63 LONG ACRE, W.C., LONDON; AND AT MANCHESTER.

BUILDING AND BUILDERS.

THE ceremony of laying the foundation-stones of the church being erected by the Primitive Methodists in Bucks Road, Douglas, was performed on the 13th inst.

CRAIGDAM church, Aberdeenshire, will shortly enter on the 150th year of its existence, and the congregation have agreed to celebrate the event by reconstructions and additions to the church edifice at the cost of between 600*l.* and 700*l.*

PLANS and specifications for new vestries, organ-chamber, &c., for Knowle Church, have been completed by Mr. Chatwin, and Messrs. Collins & Godfrey, of Tewkesbury, have sent in a tender to do the work for 770*l.* The necessary faculty has been signed, and the work of restoration will be shortly commenced.

THE Elland District Council have at present under consideration a scheme for providing the town with public baths, free library, market and electric-lighting plant, plans for which have been prepared. The site selected is a centrally-situated plot, belonging to the Council. It is contended that a united scheme would cost 2,000*l.* to 3,000*l.* less than if separate sites were purchased and the buildings erected at different times.

IT has been decided to erect at Chelmsford new headquarters for the Essex County Police. The buildings will be on part of a field of 6 acres at Faircross. They will stand back from the main Springfield Road and face the south, with entrance into the main road by a new road in Gaol Lane. They will cost 15,000*l.* to erect, and the site has cost 1,500*l.*

ELMBANK MILLS, Menstrie, N.B., which have been standing idle for a considerable time, are to be fitted up as a wood-carving factory. The mills have been purchased by a syndicate, of which Mr. Alexander M'Nab, of Middleton Kerse, Menstrie, is a member, and the intention is to have the new machinery fitted up immediately, so that work may commence in the course of the next three months. This will be the first factory of the kind in Scotland.

A LARGELY attended meeting of the Oldham members of the National Amalgamated Society of Operative House Painters and Decorators was held on the 11th inst. in the Unity Hall, Oldham, the business for consideration being an offer by the masters to concede an advance of ½*d.* an hour, from 8*d.* to 8½*d.*, from July 1 next. In the course of the afternoon, however, the masters had held a further meeting, and made an amended offer to concede the advance immediately, shops to be reopened at once. The painters, who have been on strike to the number of over 200 since April 1, unanimously agreed to accept the amended offer, the utmost satisfaction being expressed at the result.

AT a special meeting of Paisley Town Council on Friday last Mr. James Lee, Stanley Green Farm, Paisley, was elected to the vacant post of master of works by 13 votes to 10 for Mr. Stewart, Edinburgh, though at one stage the latter had a clear majority of the Council. Mr. Lee is thirty-five years of age, and for the past ten years has been employed in the Glasgow Gas Corporation department under Mr. William Foulis, C.E. He has acted as resident engineer for much of the best work carried out by the Gas Trust, and has had extensive experience in the preparation of plans and specifications, construction of roadways and railways, &c. The salary is 350*l.*

A DIFFICULTY has arisen with regard to the rebuilding of St. Luke's Church, Birmingham. The trustees under the Birmingham Churches Act have offered a grant of 4,000*l.*, with the expression of a desire that the new church shall be planned so as to accommodate a thousand worshippers. The present site would barely suffice for such a building, and a suggestion has been made that a piece of land in another situation should be taken, but it is difficult to find a site within the parish possessing equal advantages. Moreover, the Act under which the church was erected, while allowing its removal, gives no power to dispose of the consecrated ground on which it stands, so that to realise the value of the present site would require the passing of a private Act of Parliament at a cost of some hundreds of pounds. One way out of the difficulty would be to encroach upon the land at the rear now occupied by the schools, but the school premises are already cramped, and any further restriction probably would mean the closing or the removal of the day school. A number of suggestions have been made, but at present no plan appears sufficiently feasible to be the subject of a definite proposal.

AT the last meeting of Blantyre Parish Council the desirability of erecting new parish chambers was discussed, when it was agreed by a large majority to do so, the site fixed upon being the Council's own ground in Cemetery Walk. It is proposed to erect a council room, with a private and a public office, and also a registrar's office. With regard to the School Board, it was decided to ask that Board if they were willing to join with the Parish Council in having a board-room for them included in the new building, and were agreeable to pay a proportionate

share of the expense. Mr. Gavin Paterson, architect, Hamilton, was appointed to draw up the draft plans.

MR. S. BRIGHOUSE, county coroner, held an inquest at St. Helens Town Hall on Monday last on the body of James Johnson, forty-two years of age, labourer, of Marshall's Cross Road, Sutton, who died in the Providence Hospital on Saturday from the effects of injuries received at Hardshaw Brook Chemical Works on the previous day. William Taylor, contractor, Helena Road, said his man had been engaged on the job at Hardshaw Brook Works for about two months, and deceased had been employed by him for about five weeks. On Friday afternoon they were hoisting a beam of wood, 24 feet long, and weighing about 4 cwt., and deceased was in the act of guiding one end of the beam when a link of the chain broke and deceased fell, sustaining the injuries from which he died. Witness said if they ever saw a flaw in the chain they did not use it. He considered that the chain was perfectly safe for the job that they were doing. James Monsey, in the employ of Mr. Taylor, said he examined the chain, ropes and hoisting arrangements at the works about ten days ago. Everything then appeared perfectly safe. He examined each link of the chain, and did not notice any flaw. The jury returned a verdict of accidental death.

A JOINT meeting of the ward committees of the town, presided over by Mr. Wallace Allan, was held in the Council Chambers, Ayr, on the 6th inst., to discuss the vexed question of the erection of a town hall. The proceedings were of a protracted and animated character, and a large number of different schemes were advocated by the various speakers, amongst whom were several ex-councillors. The chairman said the Council had been considering the matter for eighteen months, but had failed to come to a decision; and had, in fact, thrown up the sponge by proposing to take an optional plébiscite, which, in his opinion, would only be a further waste of public money. Eventually a motion by Mr. Hugh Wood, painter, in favour of the restoration of the old hall out of the Common Good fund, at a cost not exceeding 9,000*l.*, was carried.

IN the excavations of St. Michael Bassishaw distinct traces of three floors lower than the existing one have been discovered, showing that at least three churches have stood upon the site prior to the fire of London.

ELECTRIC NOTES.

THE Shrewsbury Corporation having purchased the elec lighting undertaking from the Shropshire Company, it is an pated that the demand for light and power by private c sumers will largely increase; and as the streets and pu buildings will also be lighted by it, a considerable extensio the works has become necessary, therefore the lighting c mittee have decided to spend 4,139*l.* for this purpose accordance with an estimate of the electrical engineer.

THE result is now approximately known of the second ye working of the electric light in Chester. After paying discounts, the committee have a sufficient balance to interest, sinking fund charges, to wipe off another third of preliminary expenses of the undertaking, and to add 1,000 the reserve fund. One-third of the preliminary expenses already been paid off, and last year 500*l.* was added to reserve fund. The committee have decided to reduce the p from 5*d.* per unit to 4½*d.* from March 25 last. During past year discount has been allowed on a graduated sc ranging from 5 per cent. to 20 per cent., so that for 1898 la consumers, with the cash discount of 5 per cent. allowed everybody, have had their current at the remarkably low cost of 3¾*d.* per unit. This is cheaper than the cost for with ordinary burners. The current year's price of 4½*d.* unit will be about equal to the cost of gas with ordi burners, but with the discounts which it is intended to give, large majority of consumers will have the satisfaction knowing that by using the electric light, instead of gas, t will be effecting a considerable saving. They have also deci to reduce the charge for motors.

THE use of electric light for public purposes has made such d strides during recent years, writes a correspondent of the *tingham Guardian*, that many local authorities have thought) apply to the Board of Trade for provisional orders for its)ly. "In not a few cases it has been no secret that the main ct of such applications for orders has been to prevent ate syndicates or outside authorities from coming into their ict, rather than any real intention of the local authorities iselves taking steps for the supply of the district with the ric light. I learn on good authority that the Board of le have just come to an important decision in regard to matter by stipulating that local authorities to whom pro- nal orders are granted in future will themselves have to out the work, though it might be considered more advan-)us to approach a neighbouring town or borough authority, e electricity is also being supplied, to extend the cables to de districts. In other words, once a local authority applies nd obtains a provisional order, no outside body, though istrict authority concerned might be wishful for it to do n supply that district. Having applied for the order it carry out the powers given thereby or remain *in statu quo.*'

VERY complete electric-light installation has just been lly inaugurated at the Mill Road Infirmary, West Derby,)st of which, including boilers and boiler-house, is about ., and although that capital sum must be paid back within years, careful calculations show that a substantial direct will be made by the adoption of electric lighting, while r economy will be experienced in a smaller cleaning bill. nstallation consists of 1,400 16 candle-power lamps run 10-volt circuit. The boilers are two in number, of the ck return tube type, each boiler being 7 feet 6 inches in ter by 13 feet long, and having two flues each 2 feet es in diameter, and wrought-iron tubes 3 inches in ter by 13 feet long. The steam-pressure is 125 lbs. per inch, and the boilers are manufactured by Messrs. tt, Preston & Co., Liverpool. For generating the for lighting purposes three quick-revolution steam- s by Mirrilees, Watson & Yarvan, of Glasgow, coupled to a shunt-wound Wilson Hartnell dynamo, e of giving 300 amperes at 110 volts, are used, or supplying current at night and during the time the s are not at work a battery of accumulators of 900 hours' capacity is provided, arrangements being made o charge the batteries through a "booster" or "pres- ising transformer" from off the lighting circuit or direct from any one dynamo. The wiring throughout the building is run in insulated steel conduits on the distribution board system, and every precaution has been adopted to make the installation as complete as possible and free from all danger of fire. The contractor is Mr. W. Hall, Christian Street, Liverpool. The buildings were designed by Mr. Chas. H. Lancaster, the architect to the board.

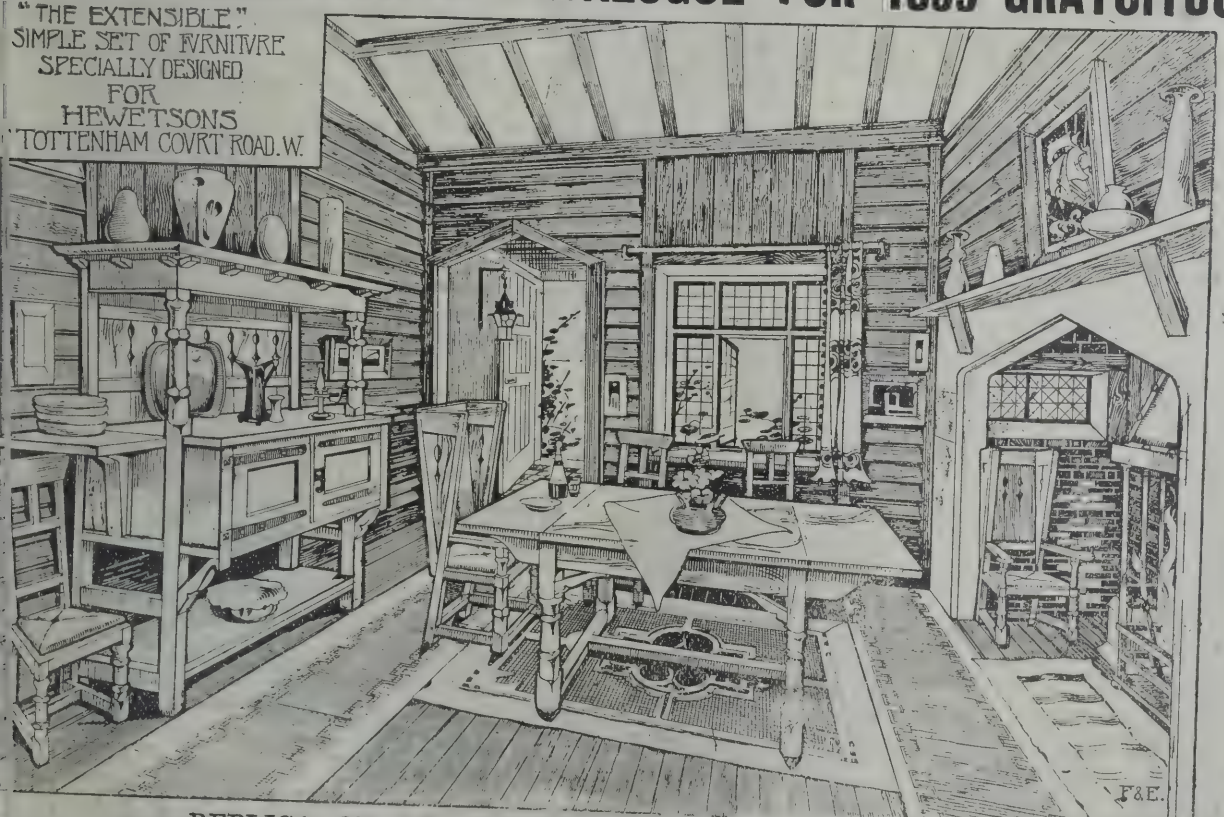
VARIETIES.

A NEW Primitive Methodist chapel was opened at Skegness on the 13th inst. The building is on the Roman Bank, and has been erected at a cost of 1,850*l.*

A NEW Wesleyan Methodist church has been opened at Bradfield, Yorks. It is intended to renovate the old chapel, with the view of converting it into a Sunday-school.

THE Bradford parish church was reopened last week after works of restoration, which have been in progress for about fourteen months.

THE church of St. James, at Dalton, near Richmond, Yorks., built as a memorial of the Queen's Diamond Jubilee and the quincentenary of the rebuilding of the parish church, was consecrated by the bishop of the diocese on Monday afternoon.



THE new Primitive Methodist school-chapel erected in Lower Camp Street, Higher Broughton, was opened on the 12th inst. Adjoining the new building, at the corner of Camp Street and Great Clowes Street, land has been reserved on which it is proposed to shortly erect a new church.

THE business of the late Mr. E. Egan, architect and surveyor, of Loughton, Essex, and 39 Lombard Street, London, will be carried on by Mr. Horace White (who was chief assistant for several years to the late Mr. Egan), in partnership with the widow, under the style of Egan & White.

THE Edinburgh Architectural Society met on the 12th inst. to hear a paper entitled "Minor Points in Practice," by Mr. J. Fairweather, of Glasgow. Mr. A. Greig, vice-president, was in the chair. The lecturer confined himself to practical points on materials and constructions, and dealt with true and false economy at some length.

AN interesting discovery has been made at Emmanuel College, Cambridge, upon the site of which a monastery stood some 300 years ago. The gardener, with some other men, were cleansing out one of the numerous ponds in the gardens on

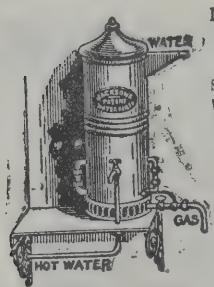
WETSONS, TOTTENHAM COURT ROAD, LONDON, W.

Wednesday when they came across some bones. Later on they lighted upon a larger quantity, and the whole upon examination proved to be human remains in a fair state of preservation.

A SCHOOL has been erected by the Pudsey School Board at Primrose Hill, Stanningley, from designs prepared by Mr. E. P. Peterson, architect, Bradford. It is built on the central hall principle as a mixed department for 389 scholars. There are three classrooms on the north and three on the east side of the central hall. The total cost of the buildings, including site, playground, fencing, fittings and furniture, is about 5,000*l.* The school was opened on the 10th inst.

THE youngest of assurance corporations, "The New Era," whose offices are at 68A Leadenhall Street, has just issued its first report and balance sheet, which are of a distinctly healthy nature, considering that practically, allowing for the time necessarily occupied in organisation, &c, only eight working months have elapsed. From them we gather that insurance business has been done, the annual income from which, in the way of premiums, amounts to upwards of 17,000*l*, and that branch offices in several of the principal midland and northern towns.

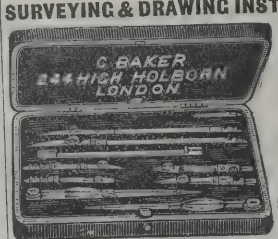


REOPENING services have been held at St. John's Church, Deansgate, Manchester. Considerable alterations have been made in the church. The old side galleries had to be taken down owing to the decayed state of the timber. They have been replaced by new narrow galleries of iron and concrete, which act as a support to the lofty side walls. Under the new gallery is a groined wood ceiling, arched over the lower windows. The church has been entirely redecorated and lighted throughout with electric light. The work has been carried out from Mr. Medland Taylor's design and under his superintendence by Mr. Scott.

FOR some years it has been felt that the accommodation for the increasing traffic over Tweed Bridge at Peebles was too limited and circumscribed, and frequently led to considerable inconvenience and even danger. The bridge was widened in 1834 to about 20 feet, but the Corporation have now resolved to widen it to 40 feet, and employed Messrs. M'Taggart, Cowan & Barker, engineers, Glasgow, to prepare plans and specification for the work and the probable cost of the extension. This has now been done, and tenders for the execution of the undertaking have been received, that of Messrs. Dickson & Clyde, builders, Peebles, having been accepted, their tender for the whole work amounting to 6,454*l.* 7*s.* 7*d.* This sum includes alterations on the roadway on each side of the bridge. The work is to be commenced immediately, and the contractor is bound to have it completed not later than December 31. This undertaking when completed will form one of the most important improvements among the many that have been effected during the past few years, and will very materially add to the amenity and attractiveness of the town.

A BAZAAR was opened on Thursday last by the Countess of Dartmouth in St. Jude's Schools, Wolverhampton, in aid of St. Jude's Vicarage Fund. The vicarage has been erected on a piece of land adjoining St. Jude's Church, Tettenhall, Wolverhampton, at a cost of 2,200*l.* The building is of ecclesiastical design; the walls are of red brick with stone dressings, and the roofs are tiled. On the ground floor there is a large entrance-hall and staircase, dining-room, drawing-room, study, two kitchens, china-pantry, larder, lavatory, staircase, &c., and on the chamber floor there are seven rooms, bath-room, water-closet, housemaid's closet, &c., with hot and cold water circulation throughout. The contractor for the work was Mr. James Herbert, and the architects are Messrs. John Weller & Sons, of King Street, Wolverhampton. The proceeds of the bazaar amounted to 312*l.* 4*s.* 6*d.*, which makes the total amount of the vicarage fund now raised 2,152*l.* 4

THE Earl of Derby has consented to lay the pol granite window panels of the new drill-hall, Ormskirk building, which is expected to be ready for opening e August, will not merely be an ornament to the town, but great use to the volunteers and many of the residents for purposes. The chief feature, of course, is the drill 87 feet by 45 feet—which, in addition to the ordinary u be admirably adapted for concerts and balls. At the fro be the officers'-rooms, and over these a large billiard-r being constructed. To the rear are the armoury, ser orderly and magazine-rooms, and over these a recreation The drill instructor's house will be included in the p the surrounding land will be laid out in rockery and shr



THE new fire-brigade station which has been ere Johnston Street, Paisley, was opened on the 13th inst. the Baronial style of architecture, is quadrilateral in fo covers about 40 poles of ground. Whilst its main fr measuring 97 feet, is in Johnston Street, the building i wise bounded by Prussia Street, Gordon's Lane, and th property in Johnston Square. It is three storeys in hei is surmounted by a tower. On the ground floor is the

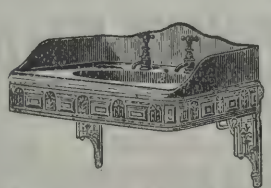
, which is 53 feet by 32 feet, with four run-out gateways to ston Street, and a four-stalled stable opens into the room dmit of the horses being promptly attached to the fire- nes. The watch-room, telephone exchange, superinten- s-room, recreation-room and bath-room are placed to the of the main entrance, and at the back of the station yard he stores and workshop, the latter being equipped with ce, travelling crane, and other accessories to permit of rs on the premises. The superintendent's house and es for the men are situate on the first and second floors. ne houses are connected electrically with a system of bells ned from the watch-room, and in the event of any alarm g the night time the switch that sends the current to the also turns on the electric light in all the houses, and still er to assist the firemen to turn out quickly, the various ases lead to a common exit which brings the men at once he engine-room. Ten members of the brigade reside on premises. The station is splendidly equipped with all rn appliances for the extinguishing of fires. The cost of ilding has been about 8,000*l.*

THE little church of St. Andrew, which has been erected charming spot on Cranleigh Common, Surrey, as a rial of Queen Victoria's long reign, was dedicated on the inst. by the Bishop of Winchester. The church is a e structure of red brick, the interior of the walls being with the same material. It consists of a nave 50 feet by t, chancel 24 feet by 18 feet, organ chamber, two porches west end, the font being placed in a line with the centre ge, and has a baptistery behind it, in addition to a roomy . Effect has been aimed at by giving the nave a greater than is usually found in buildings of the same size. All ndows are plain lancets of brick, and at the west end is a shingled bell turret. As far as possible local als have been used in the erection. Seating accommoda- afforded for about 230 persons, although for the dedica- ervice more chairs were put in. The fabric has cost 2,000*l.*, the enclosing of the site with an oak fence r 50*l.*, but as much of the church furniture has been pro- by the generosity of various friends, the total expendi- is not been less than 2,700*l.* The work has been carried Messrs. Mitchell Bros., of Shalford, who also made the oak chancel screen, the oak pulpit and the oak clergy all from designs by the architect. The chancel windows the well-known firm of Hardman & Co. The whole of rk has been carried out under the personal supervision of the architect, Mr. E. L. Lunn, of Guildford, to whom, and to the builders, great credit is due for the thorough manner in which it has been executed.

THE new accident hospital which has just been completed at Alloa, N.B., has been opened by the Earl of Mar and Kellie. It has been erected from plans by Mr. R. A. Bryden, architect, Glasgow, and is situated to the west of the old hospital in the Sunnyside district of Alloa. The main building consists of a central administrative block and two wings, one containing wards for males and the other for females. Each of the wings contains one ward for six beds, one ward for three beds, and two private wards for one bed each. All these wards face the south, and are flooded with light from large-sized windows. The wards are approached from the central part of the building by wide corridors. From these corridors the latrines enter at the back; ward sculleries are also provided, entering off the corridors. Observation windows are arranged in the wards, so that nurses can overlook more than one ward at the same time. The floor of the wards is of pitch pine, and all corners are rounded so as to reduce to a minimum the possibility of lodgment of dust. The lower walls of the corridors are lined with tiles, and each corridor has an exit porch for convalescent patients obtaining access to the grounds in rear of the buildings.



AT Northcorner, Devonport, the formal opening ceremony has taken place of a new building, which has been designed to afford more warehouse and waiting-room accommodation for traders and passengers, the need for which had become very pressing. More than ordinary care has been exercised in arranging the plan of the building in order to obtain within a limited area the necessary accommodation for the many and varied requirements which it is desired to meet. On the north-west side of the building is a spacious warehouse, two storeys high, having a floor space of 423 superficial feet. At the rear of the warehouse is a spacious store yard for casks, empties and perishable goods which up to the present have of necessity been left on the quay and landing-stage. Facing the Hamoaze is a general waiting-room, with vestibule, and a ladies' waiting-room with lavatory. On the Cornwall Street side is a pier-master's office and a smaller warehouse for lighter goods, parcels and fruit, the traffic in which is very heavy during the summer. The piermaster's quarters are conveniently arranged and comprise living rooms, scullery, two bedrooms, offices. The building is of a substantial character, the exterior being faced with red bricks and terra-cotta, relieved by Portland stone. The gables are finished in moulded stonework and sur-

mounted with shaped terminals. Over the waiting-room entrance is the Corporation motto in gilt letters on a stone pediment. The floors are laid with encaustic tiles and the walls of the ladies' lavatory finished and decorated with glazed tiles. Mr. H. E. Skinner, of Plymouth, was the contractor, the price being 1,492*l.*, and the work has been carried out under the supervision of Mr. J. F. Burns, borough surveyor.

A QUAINT Elizabethan mansion, with a wonderful old wooded garden and beautiful grounds transformed into an hotel in which modern luxury is to be obtained is unique, and for that reason Edinburgh should welcome in its vicinity, the commodious hotel to which the residence, formerly occupied by Mr. Charles Jenner, has been adapted, and which has been decorated, luxuriously furnished, and thrown open as the Queen's Bay Hotel, Joppa. Mr. Jenner was a lover of both art and science, and his rock garden of Alpine plants is world-famous, and remains as one of the numerous attractions of the hotel; which include many of the art treasures collected by him which, with the addition of handsome furniture and all the refinement and comfort which are expected in an up-to-date hotel, make the place entirely charming. Beautiful views of the Forth and Lomond Hills, the dark dense woods of Buccleuch, are obtainable; the garden and grounds are unusally charming, and the rooms are luxuriously furnished. The fine apartments of the old mansion have been embellished and adapted to the needs of an hotel in which all modern comforts should be found; the hall and lounge is a delightfully cosy feature, and the handsome drawing-room has been furnished in the Louis XV. style by Messrs. Oetzmann & Co., of 62-79 Hampstead Road, N.W. The architect of the new building was Mr. Peter R. McLaren, Edinburgh; the builders, Messrs. William Turner & Sons, Edinburgh.

THE handsome new school erected at Muiredge, Uddingston, by the Bothwell School Board, was formally opened on the 8th inst. The building gives accommodation to 916 scholars. There is also a grand central hall accommodating 196. The cost has been 10,000*l.*, or an average of 9*l.* 4*s.* per scholar. It is an imposing structure, unlike, externally and internally, any building of the same kind. It is two storeys in height, with a hall in the centre 59 feet long and 26 feet wide, lighted from the roof and by a handsome double-mullioned stained-glass window in the east wall. The roof is of open-timber construction, with carved spandrels and laminated ribs, and resting on moulded brackets. There are four separate entrances from the outside to the various classrooms, of which there are seven on the ground floor and seven on the upper floor, hav lavatories and cloak-rooms at the immediate entrance on e floor. At the east and west sides of the hall th are spacious stairs resting on polished stone colu with embellished capitals. The headmaster's room is the ground floor, and the male and female teachers' rooms on the mezzanine floors. All the classrooms are flooded light, and those on the ground floor are entered from the g hall, and the classrooms on the upper floor from a ga around the hall. The classroom walls are boarded with p pine, stained and varnished; and the staircase and lava walls are lined with enamelled tiles and embossed bord The heating of the building has been arranged by low-pres hot water pipes and radiators acting on cold air inlet sh and extracting vitiated air shafts to ventilators on the roof. all the classrooms there are placed Stott's patent ventila sun-burner lamps. The exterior has the appearance of educational institute of the Tudor period, with ornate ga and octagonal minarets, and deeply recessed mullioned transomed windows and hood mouldings. On the ridge of roof there is placed an elaborate louvre for extracting vitiated air. The plans for the building were prepared Messrs. Bruce & Hay, architects, Glasgow.

THE TEMPLE OF TEPOXTECO.

THE temple of Tepoxteco in Mexico is built upon a which is a sheer mass of rock more than 2,000 fe height. Between this cliff and the extraordinary ring of above it there is a *couloir* or chimney of loose fragmer rock, which, says the *San Francisco Chronicle*, the v must climb, no matter whether he ascends from Tepoxtl descends from San Juanico, a village above the circular He is aided by a ladder at the worst part, but he must tra himself from the topmost rung to a basaltic mass 3 feet to th of the ladder, with the prospect of rolling down 200 feet slips, and the probability of pitching down the gorg Tepoxtlan head foremost, about 1,800 feet. Holes for the l and feet were cut long ago.

The ascent up the gorge of Tepoxtlan is toilsome to th degree. Though it is narrow, yet it would have been fe to make a winding trail like the one in the Yosemite leads to Eagle Cliff. But this was not done. On the con the ascent was made as difficult as possible by making a

IMPERIAL BUILDINGS, LUDGATE

rway of masses of rock from 2 to 3 feet in height, so that ıbing the Canyada of Tepoxtlan is as bad as getting to the of the pyramid of Cheops.

The temple is a building of two terraces, upon the model of so-called pyramid of Cholula, which has four terraces, and he Tower of Babel, which had eight. If the tomb of Lars sena was ever constructed, which competent authorities e doubted, Tepoxtlan was upon precisely the same lines of ıitecture, if we eschew the structures upon the terraces. It ecause these could not be constructed that the tomb of the ıt Etruscan chief has been scouted. What may be called skeleton was simply a structure of two terraces, a mound nasonry with the tomb at the farther end. This is precisely t Tepoxtlan is, only that instead of a tomb there was an osure with an arched or vaulted roof supported by four rs built up of masonry, which was covered originally with ıe white stucco. The exterior of the whole temple was red with this stucco, so that from below upon the crest of slope leading down to Tepoxtlan it is exceedingly con-ıous. It was a "white house" beyond question, and sug-s the inquiry as to whether there was not some symbolic ning to all such structures, which are mentioned in the est chronicles of all European nations. We had in Eng-more than one "Candida Casa," more than one Whitern Whitby, and Casa Blanca is by no means a rare thing in n and Italy.

Upon the second terrace are the remains of the four pillars supported the roof and the three walls of the temple. ıe are intact up to the spring of the vaulting. If there had any openings for the purpose of giving light there would been traces of them; but there is none, from which we draw the conclusion that lamps were used during the nonies. Had torches been employed the walls would have blackened. The temple was all the darker because it was ivided into two by breast-high walls that joined the third ourth pillars to the side-walls of the structure. All along side-walls there was a broad seat about 20 inches high, he front of this was covered with sculptured slabs nearly e. These have been stolen and rude imitations have been ituted. When I paid my first visit I particularly noticed he slabs were of red sandstone, and that the carving was but singularly fine. I have seen Aztec sculpture in many s, but I do not recall any that could compare with these My observation of them was very general, because my attention was absorbed by one which represented an "elephant in war-trappings." It was carved very well, but minute observation made it clear that it was certainly copied from an older slab whose place it occupied. This was not the case with the others, which in style and subject were distinctly Aztec. The impression made upon my mind at that time was that the original was Carthaginian, and I had no doubt that it was a symbol of the Tyrian Hercules, whose name in Phœnician was Yar Cul.

The examination of the masonry corroborated my general impressions. Where the cement had been removed or had scaled off the courses of stone-laying showed clearly that the work was done by civilised men. The stones, although irregular in size, were all beautifully squared and were laid in a very hard mortar. The plateau had not originally been quite broad enough, and to lay the foundation of the first terrace it was found necessary to build a retaining-wall some 15 feet down the side of the couloir, up which the visitor drags himself. Here the stones are all of one size and the courses are perfectly regular, and the angle of inward inclination is maintained with exactitude. There is not in all Mexico any masonry that will compare with it except at Mitla, but the retaining-wall of Tepoxteco was laid by masons who had to be lowered on a plank to do the work, precisely as house-painters are lowered to paint the lofty walls of modern buildings.

THE WORKMEN'S COMPENSATION ACT.

THE Home Office has issued statistics of the proceedings in English and Welsh County Courts under the Workmen's Compensation Act during the first six months it was in operation—from July 1 to December 31, 1898. It is pointed out, however, that the return really covers a much shorter period. The right to compensation accrued only with regard to accidents happening on and after July 1. It was only at an interval after that date that disputed cases could come to trial or arbitration, and in most cases there was further delay before decisions were given. Therefore "to regard the tables as representing three months' working of the Act would probably not be very far from the mark." As yet no comparison can be made between the numbers of cases dealt with under this Act and under the Employers' Liability Act, but in future returns comparisons will be made as far as possible. It is shown that the number of cases under the latter Act had not been sensibly affected up to the end of the year.

ICE LIST AND ESTIMATES ON APPLICATION

In county courts 130 cases had been settled up to December 31 last—104 by the judge's award, eight by an arbitrator's award and eighteen by acceptance of money paid into Court. Other cases to the number of forty-eight were withdrawn, settled out of Court or "otherwise disposed of." In 101 out of the 130 cases the decision was for the plaintiff. In thirty-eight cases compensation was awarded on account of death, the average award being just over 200*l*.

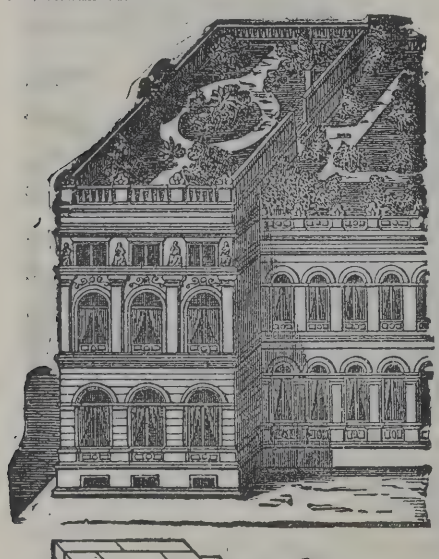
Another table relating to agreements and informal arbitrations is admittedly incomplete. It professes to give "the number of cases in which memoranda were registered in the county courts, and shows which of these cases were settled by agreement, which by committee, which by arbitrator agreed on by the parties. Of the cases which come into the return, 152 were settled by agreement, nine by committee and two by an agreed arbitrator. As already pointed out, these figures represent only a very small proportion of the agreements under the Act, and of the decisions of committees and informal arbitrators. Apparently it is not considered necessary in most cases to go to the trouble of registering memoranda."

The courts where most cases have arisen have been Liverpool, Leeds and Bow. Bow is also easily first, as usual, under the Employers' Liability Act.

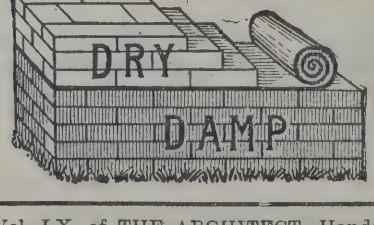
The following are the Home Office comments on the statistics:—

In conclusion, it should again be stated that the most serious mistake that could be made with regard to these returns is to imagine that the cases which come before the county courts represent any considerable proportion of the cases in which compensation is claimed or paid under the Act. There is a concurrence of testimony that in the great majority of cases the full compensation allowed by the Act is given without question, but unfortunately no figures can be obtained which even approximately represent the actual payments. The Home Office committee, which reported in the end of 1897 on the question of the appointment of medical referees, as the result of a careful examination of all available statistics of accidents, both official and non-official, and of comparison with the German accident rates, estimated the annual number of accidents in England and Wales for which compensation would be payable as between 120,000 and 150,000. Taking the lower figures, this would give 30,000 as the number of cases of accident within the Act in a period of three months.

Even if the total number of cases for the period covered by the return were put so low as 20,000, the number of cases carried to the county court (178) would still be considerab less than 1 per cent. of the whole, and even of these some we taken to the court not to dispute payment, but to settle t question of the person to whom the payment should be made



However far the figures just quoted may be from an accura estimate of the total number of cases, they may perhaps ser to show that the very small number of litigated cases must n be taken as any measure of the number of those in which co pensation has been paid under the Act.



This lesson is also enforced by the returns from some the districts. The county court district of Stokesley a Guisborough appears to be the only district where memoran of agreements were generally registered, for though a co siderable number were registered also in Middlesbrough, it not clear that the registration was general. In the Stokesl and Guisborough district, with a population of 28,000, chie miners, while there were no litigated cases in the coun court, there were up to December 31 at least eighty cases which compensation was paid without dispute (seventy-eight b agreement and two on the award of a committee). If it cou be assumed that the same ratio of cases to population hol throughout England and Wales, this would give against n litigated cases about 80,000 cases in which compensation w paid by agreement. This figure is, of course, too high; in district where a mining population preponderates the prop tion of accidents for which compensation is payable under t Act is much greater than in the country generally; but ev when full allowance is made for this difference the result sufficiently striking.

Not less noteworthy is the fact that in some of the larg and most populous industrial districts, where numer accidents must certainly have occurred in the employme coming within the Act, not a single litigated case under new Act had up to December 31 been taken to the cou court and decided either by the judge or arbitrators. Th there was not one case from the mining districts of Durh Consett and Bishop Auckland, with a population of 312,000, from South Staffordshire, with a population of 575,000, from Plymouth and South Devon, with a population of 480,(nor from Cornwall, with a population of 314,000. In Bris with a population of 355,000, there was only one case, and c two in the circuit which includes Halifax, Huddersfield Dewsbury, and has a population of 582,000.

In next year's return it will be desirable to include a ta giving statistics of appeals under the Act. It will also

PATENT
VULCANITE ROOFIN

Since the introduction of the patent Vulcanite Roofing into this country it has beer by a great number of leading architects for Public and Private Buildings, Hotels, Schools, I Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter an than under any other roof. When properly laid repairs are never required, and all guaranteed. The roof-surface can be used as a garden, or for any other purpose. T construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, B TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width inches, being more convenient than the usual damp-course slabs, and saving laps. Price quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., SARKING under slates or tiles, manufactured in five different qualities and in rolls of ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and r annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c re Sheet Asphalte, free.

rable to obtain tables for Scotland and Ireland in as nearly possible the same form as those now presented.

NORWICH TECHNICAL SCHOOLS.

e foundation-stone was laid on Monday last of the new hnical Schools which are in course of erection in St. rge's, Norwich.

The area of the site is about 18,000 superficial feet. The dings have a frontage of 190 feet to the river and 120 feet t. George's Bridge Street, and consist of basement, ground r, first floor and second floor. The foundations necessitated vations of considerable depth below the river level so as to h the gravel bed. Advantage has been taken of the neces- depths of foundation walls to form a basement 11 feet ches high beneath the whole of the buildings. The follow- accommodation is here provided :—Heating and ventilation tment 55 feet by 24 feet, technical instruction in ironwork, engineering, ditto lasting, ditto plumbing, large storeroom, cloak room, ditto lavatory.

On the ground floor will be rooms for technical instruction oot and shoe making, dressmaking, manual training, tech- l instruction, headmaster's room, secretary's room, library, e committee room, store room for bicycles, cloak room, tories for both sexes and strong room in tower.

On the first floor, rooms for wood carving, geometry, hine construction, science lecture theatre, chemical labora- preparation room, balance room, lecture hall with retiring n, manual training room, science headmaster's room, science art room, and male and female lavatories will be provided ; on the second floor art design room, model and casting n, elementary art room, life room, painting room, antique n, art headmaster's room, and male and female lavatories.

The roofs will be covered with green slates laid in graduated ses and flaring out at the eaves.

ccess to the whole of the floors is by means of a principal case 36 feet by 19 feet, leading from basement to roof. At floor there is a large landing, from which a corridor 9 feet runs from east to west the whole length of the building. e is a second staircase at the east end of the buildings h gives direct on to the corridor. The staircases will be ructed in concrete throughout. The main stairs will be orted at one end of each step by the outer wall ; the other will be supported on arcading carried from the basement to evel of the second floor.

The floors will be constructed of steel main and subsidiary girders. This concrete will be covered with pitch composition, and the grooved and tongued floor boards will be nailed thereto, except in corridors, basement and lavatories, where the surfaces will be finished with hard white Penrhyn granite chippings concrete. The laboratory floors will be laid with Val de Travers asphalte.

The windows will be constructed with N.A.P. fittings, with the object of enabling them to be cleaned, &c, without exposing the cleaners to danger.

The main entrance is in St. George's Bridge Street, with a secondary entrance from Monastery Court, formerly known as De Hague Yard. Most of the doors of the buildings will be fitted with panic fittings so arranged that while they can be locked securely against persons trying to enter the buildings, or the rooms in the buildings, persons inside the rooms or the buildings cannot be prevented from leaving.

The estimated cost of the building is 22,000*l.*

The whole of the designs, specifications, &c., have been prepared by and the erection of the buildings is being carried out under the superintendence of the city engineer, in conjunction with Mr. W. Douglas Wiles, his chief architectural assistant. The general contractor is Mr. Samuel Warburton, of Manchester, the clerk of the works is Mr. Barrett, the agent for the contractor for the buildings is Mr. Bousfield. The Cossey bricks are being made by Messrs. Gunton Brothers, of Cossey; the carver of ornamental work in pediment of porch, gargoyles, &c., is Mr. Minns, Arthur Street, Mariners' Lane; and the stonemason is Mr. Halls, St. Augustine's.

WALSALL NEW MUNICIPAL BUILDINGS.

AN inquiry was held on the 13th inst. at the Guildhall, Walsall, regarding an application by the Corporation for approval of the borrowing of money to purchase land as a site for municipal buildings ; for consent to the application of the proceeds of the transfer of consolidated stock towards defraying the cost of such purchase ; sanction for borrowing 8,000*l.* for the provision of sanitary depôts at Bloxwich, and 1,230*l.* for the construction of sanitary conveniences in various parts of the borough.

The town clerk explained that there were really five applications in one, the first being for sanction to the borrowing of 5,100*l.* to defray the cost of purchasing additional land as a site for new municipal buildings, and in connection with this the

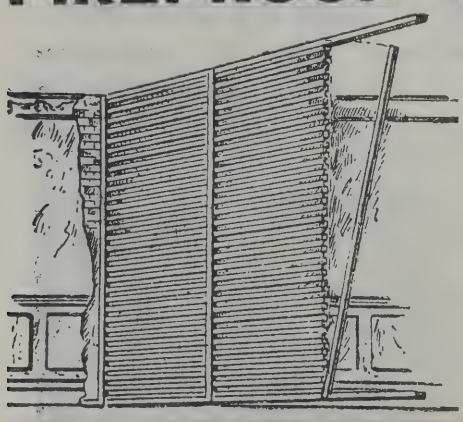
Corporation asked that they might be allowed to sell certain consolidated stock and apply the proceeds in part payment for the land which it was proposed to purchase. With the approval of the Local Government Board the Corporation had already obtained a loan of 6,000*l.*, with which they had purchased 4,308 square yards of land in Lichfield Street, which it was intended should be the site of the new municipal buildings. The site was an admirable one in the very centre of the town, but the area was, unfortunately, insufficient to meet the present and the probable requirements of the town, and as, in any way, the buildings must be set back there would be a further diminution of the area. On realising this the Corporation endeavoured to obtain further land, and they had entered into a provisional contract was Darwall's trustees to acquire a further 4,737 square yards, having a frontage of 369 feet to Darwall Street and 153 feet to Leicester Street. This purchase, if carried out, would result in the Corporation having land sufficient for all requirements, and the enlarged site would have the great advantage of having additional frontages to Darwall Street and Leicester Street. There was also another consideration, namely, the land it was proposed to acquire extended to the rear of the public baths belonging to the Corporation, which could consequently be extended in case of necessity ; and the baths had been so much appreciated that there was little doubt some extension would become necessary in a very short time. As regarded any question as to the largeness of the area as a site for municipal buildings, there was no doubt a very considerable sum of money would be spent, and the Council were anxious there should be no difficulty through having insufficient land. A stream known as the Mill Fleam ran across the land ; but Lord Bradford's manorial rights would be acquired for 100*l.*, and the stream arched over, as had been done in other parts of the town. There was no one present to oppose the application.

The proposed loan for sanitary depôts was dealt with, the town clerk explaining that 7,500*l.* was for providing a central sanitary depôt in Wolverhampton Street on land belonging to the Corporation. The present sanitary depôt would be abandoned, the accommodation being inadequate and the conditions unsatisfactory. The land, however, might be applied to other purposes. Asked by the inspector if any particular purpose could be specified, the town clerk said it would form an excellent site for a new fire brigade station, the need for which had been urged upon the Council.

At the close of the inquiry the inspector visited the various sites and places to which reference had been made.

THE INSTITUTION OF JUNIOR ENGINEERS.



At the meeting of this Institution held at the Westmins Palace Hotel on Friday, April 14, the paper read was "Piles and Pile-driving," by Mr. H. Cartwright Re M.Inst.J.E., of H.M. Dockyard, Chatham. Mr. Basil H. J chairman, presided.

In introducing the subject the author made allusion to t antiquity of pile-driving (as evidenced by the pile dwellings the Stone Age, and to the recent discoveries of Mr. W. Donnelly of the crannog on the banks of the Clyde, ne Dumbarton Castle), to the preservation of piles under London Bridge for 600 years, and to ordinary foundations Chatham Dockyard.

Various types of piles were then described—bearing pi for remedying an unstable foundation, which was effected transferring the weight to a firmer material belo by consolidating the loose material itself, or by holdi the piles in position through the friction of their perimete sheet piling for facing to wharves, for cofferdams, and surround excavations made in waterlogged areas as at Chatha Docks, and in compressible soils to prevent material fro escaping from under additional weight. True sawing w essential for watertightness, and the difficulty of drivi regularly was partly overcome by the use of grooved a tongued piles ; correct shoeing and ringing were of gr importance ; details of the shoes in general use, as well as special shoe for grooved piles were described.

Various kinds of cast-iron screw piles were illustrated, a attention drawn to a recent form of wrought-iron and st built-up pile for driving, rolled from 6½ to 13 inches diameter

Different forms of pile-drivers were dealt with, and more modern endless chain driver, as well as the "Lacou steam monkey, compared with them. The sinking of scr piles and the advantage of the use of the water-jet in san soils were alluded to. Diagrams indicating the resistanc met with in driving a pile were shown ; these resistances w due principally to the inertia of the pile itself, the elasticity the pile and the ground, the resistance at the point, and fricti of the sides of the pile. As the value of the two latter var with every different section of ground there was difficulty obtaining a correct formula to apply to pile-driving. Empir formulæ which depend upon the amount of work expended driving found most favour, though many of these neglec entirely the quality of the timber, the length of the pile and

Imperial Buildings, Ludgate Circus, London, E

tional dimensions. The results of the formulæ in use varied the value assigned to a pile under given conditions, and a ying factor of safety was recommended, so that it was bable as accurate results could be obtained from Rankine's tement that the actual load applied varies from 200 lbs. in t ground to 1,000 lbs. on reaching firm ground per square h of sectional area, providing the pile is supported, and not e to bend.

The detrimental effects in practice of high falls of the nkey were then considered. They were caused by the idity of the blow not allowing the inertia of the pile to be rcome before the full force of impact was developed; in the re modern practice heavier monkeys and low falls were ployed, thus "coaxing" the pile down without destroying it. pidity of blow of the monkey kept the ground surrounding pile from close contact and effected a considerable economy, he longer the interval between the blows the less the pile k per blow. Experiments showed that piles offered a ater resistance to sinking after absolute quiescence than nediately after the cessation of driving, though this effect more pronounced in soft or wet ground than in dry and rse gravel and sand.

In the discussion which followed Messrs. P. J. Waldram, Eade, J. Macfarlane Gray, J. H. Pearson, W. F. Crisp, W. Porter, T. Sims, T. P. Hosegood, A. W. Marshall, F. Krall, R. Marshall and E. A. Berry took part, and the ceedings terminated with the announcement of the ensuing on April 15 to the Vauxhall Bridge Works, and ensuing ting on May 5, when a paper on "Gun Construction" ld be read by Mr. W. H. Owston, M.Inst.J.E., of olwich.

REAT BRITAIN AS AN IRON IMPORTING COUNTRY.

s not so generally realised as it might be supposed likely to says the *Scotsman*, that the United Kingdom is now the st iron and steel importing nation in the world. This may e as a surprise to the majority of people, who have been stomed to look upon this as a great industrial nation, se manifest destiny and chief business it is, and has for rations been, to manufacture for the rest of the world. so it is—or, at any rate, has been, until quite a recent date. But the two things are not, after all, incompatible, or the trade relations of Great Britain would hardly be such as they are to-day. Nor is the experience of our country in this respect unique. With the exception of Russia, Germany, which is also the largest producing nation, imports larger quantities of iron and steel than any other continental country, and has done so for many years. The United States, which has long run alongside our own as a great iron-producing country, has also, until recently, imported more iron and steel than any other nation in the world, and within the last ten years has imported from Great Britain as much as 600,000 tons of these commodities in a single year. But the notable feature about our own case is that while other iron-producing countries have, as a rule, been reducing their imports from rival nations, Great Britain has been largely increasing the quantities consumed from this source. Ten years ago our total imports of iron and steel were only 323,840 tons. This year, if the promise of the first quarter be maintained, our imports will exceed 750,000 tons, and their total value will be close on six millions sterling. In these figures we do not include iron ores, of which in the first quarter we have imported 1,790,138 tons, which is at the rate of over seven million tons a year, and of which the computed value has been 1,331,298*l.*, or at the rate of 5,325,192*l.* a year. Put in another way, our total imports of iron ore, steel and iron for 1899 are likely to reach a total value of over ten millions sterling—a figure which is not approached by any other nation in the world, and which never has been approached by any other nation except the United States. The importance of these figures may be better estimated when we add that our total exports of iron and steel in some recent years have not much exceeded 20,000,000*l.*, and may possibly this year fall below that figure.

To the man in the street this will probably come as a surprise. It cannot, however, bring much astonishment to the man in the iron trade who has for years past found an increasing difficulty in combating the demon of foreign competition, which has confronted him at every turn of his daily existence, and has threatened in a great many cases to make his life a burden. It cannot surprise the Scottish ironmaster, who knows that if it had not been for the same skeleton at the feast, he would even now be able to get 5*s.* to 10*s.* per ton more for the iron that he produces. It cannot surprise the manufacturer of steel plates in Scotland and the North of England, who has during the last twelve months, for the first

ESTABLISHED OVER 20 YEARS.

time in his experience, had to reckon with the same new and inexorable force in settling the basis of his contracts with shipbuilders. It will not surprise the maker of pipes and tubes—one of the largest industries of Glasgow and its neighbourhood—who has only by the skin of his teeth succeeded in getting some home contracts of importance, including the memorable Glasgow pipe contract of a few months ago, in consequence of the intensity of American competition. It will not, moreover, disclose much that is new to the British steel-rail manufacturer from whom the Yankee has in 1898 wrested orders approaching in the aggregate close on 300,000 tons, and whose works have in consequence been doing less than one-half of what they were capable of accomplishing. All these classes of producers, and many others besides, are but too well aware of the enormous and alarming growth of our imports of foreign iron and steel in every category, including wire, nails, hoops, sheets, bars and a dozen or two additional items. The movement in its present form and dimensions is comparatively a new one. It had very little force or vitality until three years ago, when the United States practically entered the general area of competition for the first time. Prior to that time it is true we received large importations of certain articles from Germany and Belgium. If we take 1890 as a starting-point, we find that in that year we imported over 70,000 tons of beams and girders, over 92,000 tons of bar-iron, &c.—chiefly for the purposes of the Sheffield crucible steel trade—over 8,000 tons of unworked steel, largely from Sweden, for special requirements, and about 150,000 tons of other manufactures of iron and steel, much of which had no exact counterpart in our own commercial products. We imported girders from Belgium because we had not ourselves gone fully into that branch of the trade, and had not adopted the conditions that were essential to succeed. With it—such, for example, as laying in a large stock of rolls of different sizes—we imported bar iron mainly as a product used as a raw material in the Sheffield trade. And we imported unworked steel from Sweden because it was of a higher quality, or, at any rate, of a different quality, to the bulk of our steel products at home. But to-day the conditions are very different. In the interval works have been established for the manufacture of girders and beams at Glengarnock, in Scotland, at Shelton Bar, in Staffordshire, at Leeds, at Middlesbrough, at Barrow and other places, so that the resources for the home manufacture of these descriptions of steel are abundant, and yet we have to face the startling fact that our imports of girders and beams for the first quarter of 1899 amounted to abo 28,000 tons, or at the rate of 112,000 tons a year—55 per ce more than the imports of 1890, when the number of gir mills in Great Britain was less than one-half what it is to-d Our imports of bar and similar descriptions of iron have fal off, because the Sheffield trade does not now use Swedish b in the manufacture of crucible steel to the same extent as merly. But that only makes the phenomenal increase of ot products appear to be all the worse. The case of the impo of unworked steel is perhaps the most striking of all. In 18 as we have shown, we were satisfied with importing about 8, tons of this product for special requirements, but our impo under the same head for the first quarter of 1899 were at rate of over 100,000 tons a year. The trickling rivulet literally swollen to the dimensions of a flood, which has delu every part of the United Kingdom with its detritus. Most this steel is coming from the United States in the form billets, and it is being used up by wire, sheet, hoop, rod a plate manufacturers all up and down the country. We can speak as to "unenumerated manufactures" as we speak of other products, because they are not separately cla fied, but their volume for the first quarter of the current y was at the rate of over 258,000 tons for the twelve mon which is an increase of about 108,000 tons on the correspond ascertained imports for the year 1890. What we do kno that a large part of this large nondescript item took the f of American ship plates, competing with the steel manufactu of the West of Scotland; that another large proportion t the form of wire, in competition with the staple trade of W rington; that part of it competed with the hoop, sheet, bar other trades of South and North Staffordshire; and that s was crucible steel entered to compete with the staple trad Sheffield. The narrative which has just been recited is ha likely to be pleasant reading to the general reader, but much more unsatisfactory must the experience have bee the manufacturer, who has had to face this competition, "h to brow," at every stage of his attempted progress? We nothing of the fact that we import a much larger annual vol of foreign ores than any other country because that is necessarily a serious disadvantage, and because whatev may involve it is inevitable that we should every year pay to six millions sterling to the foreigner and the British shipo under this head. But the importation of iron and steel is n any means in the same category. The five to six mil sterling now annually paid for foreign iron and steel migh

t at home. In any other country except our own it would retained as a domestic manufacture exclusively. Of course, er our system of Free Trade this cannot be the case in at Britain, and it would be the rankest heresy to suggest anything should be attempted by the State to alter the ting situation. But our manufacturers may conceivably do ch to help themselves. They have been too much dis-raged until now by years of bad or indifferent trade, to ibit the enterprise and business dash that was characteristic nglishmen and Scotsmen in the earlier days of the trade, n they challenged competition with the world. It appears e now generally admitted that they have in many cases wed themselves to fall behind in mechanical equipment, ch means economy of production. Their relative situation ptly illustrated by the story of the American who declared he could not afford not to make use of the best possible it, in contradistinction to the British manufacturer, who plained that he could not afford to provide an equipment ne highest standard.

SWICH AND FELIXSTOWE BUILDING TRADES ASSOCIATION.

annual dinner of this Association was held on the 6th at the Crown and Anchor Hotel, Ipswich, the chair being n by Mr. Fred. Grimwood, with Mr. Chas. Barrett in the -chair.

After the loyal and patriotic toasts, Mr. H. Miller submitted ne Town and Trade of Ipswich," and adverted to the rapid ress of the borough in all directions, pointing out that its situation there could be no doubt that future years ld witness even greater expansion.

Councillors F. Bennett, A. Ranson and E. Catchpole re-ded, all testifying to the progressive policy of the Town ncil and the good state of trade. The need for commodious lling-houses in Ipswich had lately been felt, thus showing Ipswich was attractive to the residential portion of the munity, apart from those engaged in business purposes.

Mr. T. W. Cotman gave "Success to the Association." He rked that he looked somewhat askance on trade combina-of any kind, but in the present state of affairs he gnised that they were called into existence for the purpose utual help and defence. It was, however, by individual effort and force of character that our commercial supremacy could be maintained, and he thought it a weak point in any trade when a person was coerced from making his own bargain when he liked and with whom he liked.

In acknowledging the toast, Mr. F. Grimwood remarked that it was only by such associations that labour difficulties could be satisfactorily adjusted. They had no hostility to trade unions up to a certain point, but when the masters were not allowed to conduct their own business, it necessitated action being jointly taken by employers to protect interests which, whilst not antagonistic to the men, were of vital importance to those who had put capital into concerns, and built up valuable trade connections. He felt sure the architects must see the difficulties now surrounding the building trade, and so increasing cost of the work.

Mr. Thurman also acknowledged the toast, remarking that at Felixstowe the builders had endeavoured to compromise the matter of an advance of wages. The men, however, were exacting, and seemed determined to hamper trade.

The toast of "Past and Present Officers" was proposed in genial terms by Mr. George Abbott, especial reference being made to the services of the hon. secretary (Mr. W. Grayston), who suitably replied.

Mr. C. E. Whitmarsh gave "The Visitors," remarking that the presence of so many eminent members of the architectural profession could not be but a great gratification to the builders, whose business brought them into close contact with the profession on many points. There might at times be differences between them, but in all essential matters the builders were anxious to do work which would reflect credit on the architect, recognising that by doing so their own reputation was enhanced.

The Borough Surveyor responded in a most interesting speech, quoting statistics showing how steadily the town had grown since 1885. Since that year more than 3,000 dwelling-houses had been erected; 700 buildings other than dwellings had been built, and over 100 roads and streets made up. He confidently predicted the progress of Ipswich, and hoped his pleasant relations with the builders of the town would continue in the future as they had in the past.

Councillor G. Fenn and Messrs. W. Eade and T. Miller, C.E, also replied, the latter gentleman referring to the expected report respecting the dock improvements.

During the evening a musical programme was well carried out.

THE TELL-TALE PLUMMET IN THE WASHINGTON MONUMENT.

Doubtless the longest plumb line in existence, says Mr. C. Francis Jenkins, C.E., in the *Scientific American*, is that suspended in the Washington Monument, which has a free swing of more than 510 feet. It is of hard drawn copper wire, $\frac{3}{64}$ inch in diameter, and is suspended, for protection, in a galvanised iron pipe. The wire is located in a plane cutting the centre of gravity of the monument, which is 174 feet 10½ inches above the door sill. The plummet was set June 12, 1887, with the top end of the wire fastened to an adjustable brass screw in an I beam about 10 feet from the west wall.

In the plummet house (which is rivetted to the vertical protecting pipe) at the base is a hollow iron pedestal, one side of which is fitted with a door for access to the interior, where stands a bucket of water in which the "bob," a 25-pound brass spheroid, swings. On top of the pedestal are two telescopes, one on the north side facing south and one on the east side facing west. Both are moved by micrometer screws with a travel along scales graduated to inches and twentieths, which, with the screws, give readings to thousandths of an inch.

These readings are taken daily, the maximum deflection ever observed being 0·14 inch, which by calculation shows that the top of the monument moves about three times as far as the centre of gravity.

As carefully-taken data would prove of great value to engineers who undertake the erection or custody of very tall shafts, it is proposed to make the readings automatic and continuous by means of a kind of improved pantograph enlarging one thousand times. These, with the heat records taken at the top and at the bottom, both inside and out, would constitute a record of great value, showing what scientists call the "breathing" of this 81,120 ton mass of stone.

No less interesting was the location of the shaft, or what is recorded thereof. The bench mark, known as the Jefferson pier, was built on the first meridian line of the United States in 1793. It is at the intersection of a line drawn N.-S. through the centre of the Executive Mansion, and another E.-W. through the Capitol. No considerable record exists of the establishment of these lines, although it is tradition that President and Mrs. Jefferson were present at the time, and that Mrs. Jefferson gave her thimble to be set in the top of the wooden monument to receive the scratched cross. From this monument, and another located 90 deg. therefrom, levels were taken, with which subsequent levels were compared to determine whether the monument settled evenly. All the levels taken show that the foundation has remained horizontal although subject to a gradual diminishing settling, which, to the centennial year (1876), was 8·82 inches.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

7035. George Howe and John Samuel Rogby, for "Improvements in the manufacture of tiles, bricks or blocks."

7132. Corbett William Woodall and Marc Ferdinand Solon, for "Improvements in or relating to the manufacture of glazed bricks."

7133. Corbett William Woodall and Marc Ferdinand Solon, for "Improvements in the manufacture of encaustic tiles."

7161. Alexander Pouey, for "Improved oven for baking pastry and the like."

7178. John Cowan, for "Improvements in boiler furnaces."

7210. John Henry Brearley, for "Improvements in or connected with regenerative furnaces for heating gas-retorts or analogous purposes, and in the special construction of bricks to be employed therein."

7247. Ladislaus Galecki, John Loplain and Paul Lopati, for "Improvements in the manufacture of bricks and analogous articles from lime and sand, and in means and appliances for effecting the same."

7434. Arthur Petrie Florence, for "Improvements in relation to firegrates, stoves, kitchen-ranges, and in apparatus appertaining thereto."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

The Architect.

THE WEEK.

Duchess of YORK on Saturday visited St. Canice's
edral at Kilkenny. It is a building well deserving of
tion, no matter how high in rank is the visitor. Its
cter is suggested by what the late G. E. STREET said
:—"Of cathedrals of a smaller scale I know none
n pleases me altogether more than that of Kilkenny,
with a happy art, though the scale is small, there is
air of a cathedral as distinguished from a parish church,
great deal of the most lovely detail." Mr. STREET
lered that Christ Church Cathedral in Dublin and
nny Cathedral are so exactly like what can be seen
rts of St. David's, Llandaff, Wells Cathedral and
nbury Abbey, "that they must have been executed
same workmen, or from the designs of the same
ect." The windows in the north aisle of Christ
h, the internal shafts of which are intersected by
at very short intervals, are imitated closely in the
doorway of Kilkenny Cathedral and in a doorway at
Florida Abbey, in South Wales. It is not consoling
ve susceptibility to have so fine a building ascribed to
hmen, but it should be remembered that in Mediæval
rchitecture was like an universal language. There
records to determine the origin of the architecture
Canice's. The east end was apparently commenced
1180 by Bishop O'DULLANY, who was of the Irish
nd completed in 1200. For eighty years afterwards
ilding was continued by fits and starts. It was
d by Bishop ST. LEGER, who is likely to have be-
to one of the invaders' families. At a subsequent
rge sums were expended on the building by Bishop
D. The eastern window was filled with stained-glass,
was so beautiful that RINNUCINI, the papal envoy
Irish Confederation in 1641, offered 700*l.* for the
nts. CROMWELL'S soldiers destroyed all the glass
uld discover in the cathedral. The building was
d in the eighteenth century by Bishop POCOCKE.
ng the cathedral is a round tower 108 feet in height.
ay Castle is another interesting building. In 1399
RD II. occupied it for fourteen days. A manuscript
n the British Museum with an illustration of the
nterview with the Irish chief, ART MACMORROUGH.

Archdeacon of Manchester, in the charge he
d on Monday, drew attention to the remarkable
ion in the outlay on churches erected between 1890
8. There were only two, and the cost was 10,400*l.*
period 1880-89 fifteen were erected at a cost of
l., and in 1870-79 there were twenty-one, with an
f 168,000*l.* The decrease was attributed in part to
essity of providing church schools in the diocese.
r cause was said to be the passing away of indi-
and families who were munificent in their expen-
n church buildings. The BIRLEY family erected
s which cost at least 30,000*l.* The gifts of the
OD family were no less generous. Among their
s are St. John's, Miles Platting, and St. Augustine,
ury. Lord EGERTON OF TATTON built St.
's, Ordsal, at a cost of 9,000*l.*; Mr. W. ROBERTS
rist Church, Didsbury, at a cost of 11,500*l.*; Mr.
St. John's, Cheetham, for 12,000*l.*; and Mr. P. R.
Clayton, St. Cross, for 12,000*l.* Sir W. H.
WORTH built St. Elisabeth's, Reddish, at a cost of
,000*l.*; Mr. BENNETT gave St. Benedict's,
, costing 16,000*l.*; Mr. C. F. BEYER, Gorton
es's and Gorton All Saints, for 13,000*l.*; and
P. STEWART, St James's, Collyhurst, for 14,000*l.*
ears some of the suburban parishes have grown
lly, and it will be necessary to make provision to
d with the new conditions. It was estimated that
s 80,000*l.* would be required. Towards that sum
can be reckoned on. Sites have been purchased,
in outlying districts prices are very high; three, for
have cost 7,500*l.* It is also worth notice that
ation has to be introduced into Manchester owing
hifting of the population. The parishes of St.
Peter, St. James, and St. Simon and St. Jude are to be united and made into one parish, with St. James's as the parish church. The sites of the two others will be sold under Act of Parliament, and the proceeds of the sale and the endowments transferred to new districts.

IF a town were to be found on the Seine within twelve miles of the centre of Paris and with a history of over a thousand years, what a wonderful amount of rejoicing would be performed in it from time to time? The commemoration of the seventh centenary of Kingston which took place this week caused very little interest among Londoners. How old Kingston is nobody can tell. It is mentioned in a charter of 946 as "the royal town where kings are hallowed," but there is evidence enough to show that the Romans possessed a settlement on the spot, and it may then have been an ancient place. Nine kings were crowned in Kingston between the years 900 and 1016. At the time of the Conquest the town was valued at 30*l.* It contained a church and five mills. King JOHN granted a charter in 1200, and made repeated visits. There is a record of members being returned to Parliament in the reigns of EDWARD II. and EDWARD III. The large church is built of flint, clunch and stone; a large part is Perpendicular, but there is also work of an earlier time. The town itself has little else to show which can claim to be ancient. The suburbs, Norbiton and Surbiton, are quite modern, and are more sought after than the older parts of the town. They impart so new a character to the place that many people are sceptical about the history of Kingston. But there is no doubt about the value of its claims to antiquity, although it makes no pretensions to be superior to many other Thames-side resorts.

A SPECIAL meeting of the council of the Glasgow Institute of Architects was held on Monday. The President explained that the meeting had been called to consider the principle of the Bill recently introduced into the House of Lords by Lord RUSSELL OF KILLOWEN relating to illicit commissions. One of the objects of the Institute is to insure that the business carried on by its members would be free from anything dishonourable, and they welcomed any action, through such a Bill or any other means, which would insure fair trading in business and honourable dealing amongst all professional men. By article 10 of the articles of association of the Institute every member is required as soon as possible after his election to sign a declaration that he will not have any interest in any trade contract for work which it is his duty to superintend or pass, nor will he receive or accept any pecuniary consideration or emolument from any measurer or tradesman working for a client under his supervision, but shall in every case receive payment for all professional services from his client direct, and not otherwise. He believed that the profession in Scotland was singularly free from this taint. The following resolution was then unanimously passed:—"That the council of the Glasgow Institute of Architects in the interests of honest trade, and to show its disapproval of illicit commissions in whatever form, resolves to support the principle of Lord RUSSELL'S Bill, and that this resolution be communicated to the Royal Institute of British Architects, and that this council expresses its willingness to support that body in any similar action it may take in favour of the principle of the Bill."

THE church of St. Dunstan in the West, which was erected from SHAW'S designs in 1831-32, may not be a perfect example of Gothic, but it is picturesque, and on that account has been often introduced in views of Fleet Street. Much of the effect depends on the church being separated from the adjoining premises by an open flagged space on each side. It will hardly be credited that recently an agreement was entered into between the rector and churchwardens and the Law Life Assurance Society, Limited, for the sale of the space on the west side of the church in order that the Society's offices may be enlarged. On the church door a notice is affixed of a petition for a faculty to legalise the arrangements. If the western part is appropriated to secular use the eastern part will soon be sacrificed.

ARCHITECTURE AT THE ROYAL ACADEMY.—I.

THE Architectural Room is likely this year to subserve satisfactorily the purpose to which it is destined. Before the exhibition closes it may be assumed there will be some warm days, and then the room will be a grateful refuge. The drawings form a lining for the walls that is cool, and will be considered refreshing. There are not many coloured drawings, while the monochromes and pen drawings are not exciting. Then there are a few models, one being as attractive as a toy, which diminish the vacancy that occasionally is depressing. Altogether the room is adapted to be a place of retirement, and we hope it will be appreciated.

For architects the contents are interesting. What can be seen are mainly buildings, for the drawings of stained-glass and decoration are few in number. There is also a general absence of sketches of old work. All the architects who belong to the Academy are not represented. Mr. NORMAN SHAW and Sir A. BLOMFIELD have not contributed drawings. Mr. JACKSON has one drawing, the new Radcliffe Library. Mr. AITCHISON sends his diploma drawing, which is a coloured elevation of the Royal Exchange Assurance Offices in Pall Mall. Mr. BODLEY, who is a rare exhibitor, has an interior of St. John's, Cowley. Mr. ASTON WEBB signalises his entry by a large drawing of "The Britannia Royal Naval College, Dartmouth," which is the only building commissioned by the Government in the collection. There is not a drawing to recall the projects for the offices at Westminster. But many architects will be glad to see a study by Mr. H. B. GARLING, one of the veterans of the profession, of façades which belonged to the design he submitted in 1857 for the new War Office, and which was premiated.

The first wall on the left of entrance, with over forty drawings, presents an epitome of the exhibition. There are many houses of various sizes, and it is not easy to be original when treating that class of building. Mr. H. T. BUCKLAND sends "Labourers' Cottages, Bromford, near Erdington," which are of red brick, but are too top-heavy to please landlords' wives who are lovers of the picturesque. Mr. E. S. UNDERWOOD's "Additions to House, Matfield, Kent," is a modest contribution of a porch and a half-timbered room above it. Mr. S. K. GREENSLADE's "Street Front" is a protest against the prevalence of the red brick house. It is a symphony in green and white, and looks attractive in the combination of Portland stone and slate. There are two houses by Messrs. NIVEN & WRIGGLESWORTH. "Hillington" shows some vigorously designed plaster relief, which separates the floors, and in the curved bays there is corresponding breadth of treatment. "Lynch House, Sevenoaks," does not attain so high a standard. The windows on ground-floor, from having semicircular heads, appear too small, for there is no need to have barriers against daylight unless in exceptional conditions. The porch is commonplace. Messrs. WIMPERIS & EAST have a well-considered design which represents "Proposed Rebuilding of London Newspaper Offices." The frontage appears as a curved line, and is flanked by projections which allow of the introduction of windows differing from those in the main part of the building. In the latter the various floors have each a special character, and the design is neither suggestive of the warehouse nor the palace, which appear to be the two accepted forms for such buildings. Messrs. BREWILL & BAILY, in "Aspley Heath," show an T-shaped house seen from one of the ends, and which is reposeful. The "Cottage Homes," by Mr. G. HORNBLOWER, are small and simple. "Cold Ash, near Newbury," by Mr. LEONARD STOKES, cannot be comprised among the things which the Germans style "Bilder ohne Rahmen," for the exterior wall is by dressings converted into framed spaces. "No. 2 West Drive, Streatham Park," is a house which is sure to appeal to many Britons, for there is no loss of land for the sake of effect, and the outer hall and drawing-room express magnitude without any disturbing corners. In the additions to "Soot Pray Farm," also by Mr. STOKES, we have a third example of what is sometimes called the common-sense treatment. The "Hall in House at Windermere," by Mr. BAILIE SCOTT, which serves as a billiard-room, would have delighted the Viking settlers. It s mainly of wood, and the material is employed with the boldness and simplicity of a ship's carpenter who dexterous with an adze. The drawing is an indication the new spirit arising among us which Queen Anne is feminine to satisfy. "The Addition to Premises, East G stead," by Mr. E. TURNER POWELL, may be calle diplomatic drawing, and it has succeeded with the scrutin who have rejected many of more architectural value. character of the building is left to the spectator's imagi tion. We know there is a shop with a red roof, but immense white blinds and the enclosure for plan obsc the remainder. So much ingenuity deserved recogniti and there may be cases where concealment is an advanta but we hope the example will not find imitators. Mr. A PRENTICE shows "Cavenham Hall, Suffolk," in th characteristic drawings which merit approbation for absence from them of finical strokes. But as they separated they do not produce their full effect. It wo be difficult to decide which view has most interest. entrance front shows a large hospitable projecting po with massive columns that can carry a large room over The gables are emphasised. In the garden front building appears of greater length and the parts at ends not correspond in height, but the lower gains compensat by the use of reliefs. In the third view the massing of roofs is seen to most advantage. In "King's Cor Biddenham," by Messrs. MALLOWS & GROCOCK, we se cottage residence approached from a garden which has ancient air. Mr. J. BARTLETT's "Victoria Institute, W hurst," appears in front as a couple of one-storey cotta but the ground drops and the rear would have a m imposing look. Messrs. LEE & PAIN, in "St. Katheri Lodge, Regent's Park," revive that species of Gothic which stuccoed walls alone appear eligible. The Spania must be stolid who are not amazed when they Mr. WORNUM's "Las Fraguas, Santander." It is an Eng country-house that could be erected in any part of kingdom, and without the least concession to any Spa characteristic. Mr. E. F. REYNOLDS's "Design for Country-house" is evidence of independent thought, there is no regard for precedent. The three divisions v in size. The central part is of one storey, but with extremely high roof that extends to the height of the ot parts, so that the sky-line is almost level. The chimne not unlike a truncated obelisk, and serves to mark division. The remaining part is rather gaunt, with sm windows in the upper part. The design may not approved, but it was worthy of admission from its nove and we are glad originality can be occasionally encoura by the Academicians. The glaringly red "Cannon St Hotel, Birmingham," by Messrs. BATEMAN & BATEMAN in another category. "Sunnyside, Holmwood," by W. T. BARLOW, is a compact residence. Two more q buildings are Mr. G. E. STREATFIELD's "House at G Marlow" and Mr. RANSOME's "House in the New Fore Mr. BATTERBURY is usually happy in treating street-fr where the space is limited. The "Stone Front, 233 Stra is the latest example. There is just sufficient differe between the one window of each floor to suggest the f is not turned out of a machine as a whole and not enc to affect repose. The "Staircase and Hall, Warnl Court," by Mr. A. C. BLOMFIELD, have allowed the in duction of elaborately-carved newels.

The "Crown Theatre, Peckham," by Mr. ERN RÜNTZ, is hung too high for adequate study, but it rev no sign of that fussiness and commonplaceness which becoming too characteristic of some of the modern thea Messrs. ERNEST GEORGE & YEATES in one drawing sent "Two Wooden Bridges," which, like those of Medi times, are covered. Both roadways are approached steps, and in the Surrey example the entrance is ma by a turret. "The Chapel, Wyckcliffe Hall, Oxford," Mr. W. WALLACE, is a small building of a freely-tre Perpendicular style with a tower at side. "The T Hall, Hitchin," by Mr. GEOFFRY LUCAS, is plain and tage like, a treatment that might be often adopted advantage in small towns. Messrs. LANCHESTER, STEW & RICKARDS in their "New Town Hall, Godalming," been successful. The projecting clock saves the cost tower and recalls several old public buildings in the co Mr. R. W. BEDINGFIELD's "Design for Liverpool R Institution" is sufficiently Classic in style to suit the

it the dimensions of the dressings to windows and doors part more heaviness to the building than is advantageous. The Roedean School," by Mr. J. W. Simpson, is a large stellated building on a terrace, with a great deal of variety the parts. Mr. Aitchison's "Assurance Office" is orth the attention of architects who have to make the ost of narrow frontages. The treatment is refined, we ight say elegant, and there is a sense of measure in aling with the carving and mosaic decoration. The Design for Council Offices, Essex," by Mr. J. A. Minty, rms a good group, the centre showing a turret that is ghtly elevated above the roof. In Mr. W. G. P. ownsend's "Wrought-iron Gates" there are enough raight lines to suggest stability. The ornamental part is ainly above, in a place where there are no strains.

The "Design for Pulpit and Bench End, St. Brelade's urch, Jersey," by Messrs. Rogers, Bone & Coles, has thing conventional about it. The preacher is not placed uch above the heads of his auditors. A screen with light lonnettes and a reading-desk in the centre form the ilpit; but there is so much character about the details is preferable to many larger structures seen in churches. r. G. C. Horsley's "New Screen, Ipstones, Staffordire," is a stately example, with fine carving, but it is not ggestive of anything detached, but of part of an enclosure which wood is largely used. Mr. Bodley's "Interior of . John's Church, Cowley," also shows a fine rood-screen. olour is employed not only in windows and on walls, but roof. It is an almost ideal Gothic church, but whether would be approved by lawyers is doubtful. The "Design Calvary, St. Bartholomew's Church, Brighton," is other advanced example of an approach to continental cedents. It shows a sculptured group in a dark recess, d is ably represented by the style of drawing. Finally, have on the wall a design for a certificate for students of usic by Mr. T. J. Grylls, which is not out of place, for the atment is architectural. But the figures are too modern harmonise with the massive columns.

(*To be continued.*)

P. V. GALLAND.*

PIERRE GALLAND and Alfred Stevens in our time enabled people to realise the versatility of many the Renaissance artists. Each of them could have rked as an architect, a painter or a sculptor, and the on of arts which they exemplified was not without antage to their productions. But however men admire satility in theory, and especially instances of it which e found long ago in Florence or Rome, they are not posed to see it flourish. It is supposed to mean an gular form of competition which has the advantage in its our of being economical. The many-sided artist is en as corresponding with the general practitioner in dicine, and as he is able to turn his knowledge to ount on more occasions, he is only rewarded with a lesser than the specialist who expects patients to pay for mployed intervals between consultations.

Alfred Stevens was repeatedly made to feel the advantages of coming too late into the world. Two three centuries before he would have found a welne in England without having to travel in quest of ers from manufacturers. There was enough of the naissance spirit in this country to inspire an appreciation his splendid talents. We cannot imagine Inigo Jones ibiting the least jealousy of Stevens, and as Stevens bably would not set up as a poetaster, Ben Jonson uld not have vented ill-will on him. Charles I. would e been proud of such a subject, and nobles like Lord undel would be sure to offer commissions for designing ices and for adorning them with paintings and sculpture. en Stevens appeared in this century there were few rons possessed of the courage to employ an artist who e no academic or official stamp, and the prospective ue of whose works could not be calculated by any tables sessed by appraisers. The spectacle was consequently sented of a great genius modelling fire-irons and doing humblest work for bread. When he obtained a commission that was worthy of his power he was tied down in official bonds, as if through apprehension that with a versatile artist there was no knowing what he would produce, and a house or a picture might take the place of a group of sculpture.

Pierre Galland happily was not doomed, like the English artist, to try his luck among a people who could not understand art, and who doubted anyone whose training was foreign as a suspicious character. But he was also made to pay the penalty of a departure from established rules. Trained as an architect, he was expected to go through the official round which by slow degrees sometimes leads to eminence. If he could devote himself to designing, the early stages would not be oppressive to him. But for a man possessed of the creative force of Galland the mechanic routine of an architect's practice is hard to bear. It was like having wings and not daring to soar. Shrewd manufacturers realised his situation and tempted him with commissions. The artist appeared to be capable to deal with all materials and to suggest how their value could be enhanced. As the son of a renowned industrial artist he possessed almost an instinct for suitability in design, and many were glad to secure the aid of a man so various as was the young Galland. His reputation went on increasing until he was accepted as one of the foremost artists of his class, and consequently as a power in France.

Then came the question, What was to be done with him? An artist who had fairly fought his way upwards until there seemed to be no higher summit to be reached could undoubtedly be utilised in the service of France. Galland had already declared that English industrial art was advancing with strides which were amazing, and that in a measurable time the production of beautiful objects in France would cease to be a monopoly. At first his words were pooh-poohed by officialism. But then it was remembered how a like prophecy was heard about military supremacy. Although the country was assured of success, since the preparations were so complete not a button was deficient on a gaiter, yet somehow the preparations were late and a failure followed. Was it not possible for another catastrophe to occur in the industrial contest? Galland had studied the problem not only in France but among her rivals; he had taken lessons from them and was competent to turn the enemies' tactics to the advantage of France. Accordingly it was decided to appoint him one of the professors or directors of the Ecole des Beaux-Arts.

Then the inconvenience of versatility became manifest to everybody holding office. Galland was not the man to be content with following a prescribed course. Nor could he believe in the advantage of keeping a student in one class, say the architectural, and then transferring him to another where there was little or nothing said about architecture. It may be an excellent intellectual exercise for a student to make out the relations between the different divisions of knowledge he has to go through, but we can see in our own Royal Academy the slight gain which arises from the separate system. Able students will be able to co-ordinate their knowledge, however diverse it may be in origin and matter, but they are always an exception. Galland wished to raise men who would resemble himself, and a better model could not easily be found. He was grounded in art by his father and his masters in Swiss schools, but the real foundation of his skill was laid in the architect's offices where he worked in Paris. There he acquired system and the species of composition which is most suitable for a designer.

In laying so much emphasis on the necessity of architecture as an element and salutary influence, it was not difficult to conclude that Galland contemplated architectural classes which would be in rivalry with those already existing. The professors of architecture accordingly treated him as a painter who was trying to confuse their ancient art, and rose against the invader. The professors of painting regarded him as an architect who was endeavouring to become an interloper in their special province, or as a designer of bijouterie and other metal-work who was posing as a teacher of painting pictures of all kinds. There was so much dissension in consequence of M. Galland's appointment, the Minister was compelled to abandon his resolve to have the artist beginning a reformation in the Ecole des Beaux-Arts. But as he did not wish

* See Illustration.

to acknowledge a defeat, he appointed M. GALLAND to be head of the Gobelins. Then followed an experience which was common in the Mediæval schools of Paris. Wherever a famous teacher migrated, crowds of students followed him. ABELARD, for example, fled to a forest, but those who sought his training were indifferent to atmospheric changes, and were content to live in huts which they formed with branches of trees. Learning was considered to be more important than stately buildings. The old spirit of the Latin Quartier was revived when M. GALLAND accepted his appointment in the dingy Gobelins. The school which was intended for the instruction of the future designers and weavers of the factory was crowded with students who aspired to something beyond "la haute lisse" or "la basse lisse." In the various examinations the students from the Gobelins attained the highest positions, and, owing to their success, an effort was made to have them placed on an equal footing with the men from the Ecole des Beaux-Arts. The contests again broke out, for it seemed as if M. GALLAND were, in spite of himself, destined to be a revolutionist. The designers who made a specialty of tapestry were also in arms against the versatile outsider. M. GALLAND was at length wearied with the constant misinterpretation of his motives. He decided to abandon official duties, and it was only by the firmest resolve he was allowed to regain his liberty as an artist.

Although M. GALLAND was approaching the term of the threescore years and ten he felt like a young man. He considered he was as capable as in his early days to undertake vast and onerous commissions. Works which had been lying in his atelier for many a day he took up to complete. Accordingly, when he was offered the decoration of a series of cupolas in the Hôtel de Ville, Paris, he accepted the commission with the eagerness of a tyro who has gained an opportunity to manifest his skill. The nervousness which was the consequence of the wranglings which seemed to be a part of his official duties passed away, and he entered on the preparations for his work with a light heart. He was ambitious to display his originality, while demonstrating his reverence for the great designers of previous periods.

The Municipal Council had decided that M. GALLAND was to celebrate Architecture and Furniture—two themes which are supreme with Parisians. In our pride we say the Frenchman has no home, but he has at least an appartement which he dedicates to the arts. We have published reproductions of the eighteen panels in which M. GALLAND depicted the labours of the men and women who co-operate in the production of a French residence—the architect, carpenter, stone-cutter, mason, smith, painter, turner, joiner, sculptor, glazier, founder with the metal-worker, engraver, potter, tapissier, armourer, musical instrument-maker, who are auxiliaries within, and the gardener who makes the surroundings beautiful. Many other artists have represented the processes of the arts, but what distinguishes M. GALLAND'S series is the intimate knowledge which they all exhibit. The panels are the work of an artist who was competent to stand by any of the craftsmen and give them directions.

The Council desired to see something more represented than mere incidents which would recall several of the industries of Paris. With all the love of realism, the French mind seeks for abstractions or general ideas. Hence the success of the mathematicians and other followers of science. In that spirit M. GALLAND was directed to unite with his trade series figures that would suggest art, matter, industry, science, commerce, navigation, agriculture and force. Some of the figures we publish to-day; the remainder will appear next week.

The classification will not be approved by all, for everyone who considers first principles has his own notions of what are the elementary constituents of social life. The earth presents us with matter and force, with land and sea. Some would comprise the four under the head of nature. The combination of nature with human effort becomes production, of which there are many definitions. The French economists of the eighteenth century, for Dr. QUESNAY preceded ADAM SMITH, called their science physiocratic, or the government of nature; and what else are art, industry, science, commerce, navigation and agriculture but varieties of the exercise of the governing power? Nature is, therefore, represented by matter a force, unless we say that art and the rest are no more th nature. However, by the adoption of similar figures symbols all the difficulties of classification are got over.

Artists will at once realise the limitations under wh M. GALLAND worked. He had to suggest abstractions placing his figures in a cloudland region outside the ea they were to be all seated and within circular outlir There was little scope for variety under the conditi imposed on him. But it will be allowed that he has c trived to be expressive in spite of all the difficulties, w the contrast presented between the medallions and panels indicates that one series was taken from life while other was the product of the fancy.

STEVENSON'S HOUSE IN SAMOA.

A CORRESPONDENT of the *Scotsman* writes:—I that there have been stories in the newspapers of looting of Stevenson's house in Samoa. They are "stori in the children's sense of the word. There has been no loot Mr. Stevenson's name is held in too high respect in the isl for the property that was his to be disturbed by the peo I do not think I exaggerate when I say his memory is de revered by the people for his goodness to them. But tho his house has never been looted it has been sold by M Stevenson. She would not use it again, and having reser all the pictures and special household gods, she has sold rest, with one great exception. The mausoleum at Keia, wh the author of "Kidnapped" rests, is reserved, along wit right-of-way to it up the mountain. Mrs. Stevenson has rig felt not only that the grave is sacred to her, but that it is property of the world and could not pass into the hands of individual.

THE CHICHELE MONUMENT, CANTERBU CATHEDRAL.

THE redecoration of the tomb of Archbishop Chichel Canterbury Cathedral, the main portion of which recently carried out by All Souls College, Oxford, has just b completed by the erection in position of twenty figure various kings, saints and others, the work of Mr. J. E. Ke They are of wood, coloured and gilded, in keeping with highly ornate appearance which the tomb presents. figures are those of William of Wykeham, King Henry the Virgin Mary, King Henry V., Catherine of France, Alphege, the Duke of Clarence, St. Gabriel, Mary Bo St. Dunstan, St. Anselm, St. Augustine of Hippo, Abra St. Gregory, St. Thomas of Canterbury, St. Augustin Canterbury, St. Jerome, St. Michael, St. Ambrose and Edmund.

It is interesting to recall the legend connected with th and tomb of Archbishop Chichele. He was born at Hig Ferrers, Northamptonshire, where he afterwards establish college, built a church and an almshouse. He was like the founder of Bernard's (now St. John's) and All Souls leges, Oxford, of which University he had been an alum He erected at Lambeth the great tower of the palace, calle Lollards' Tower, from the sectaries so denominated having imprisoned there. He appears to have held a middle course tween those who favoured and those who opposed the pretens of the see of Rome, evidently leaning, as far as prud dictated, to the liberty of the English Church. Worn out age and infirmities, after he had filled the archiepiscopal for twenty-nine years, he wrote to Pope Eugenius for lea resign; but he died before the pope's answer arrived. reported to have advised Henry V. to undertake the Fr wars, but the story runs that, when he heard of the ter slaughter and realised the miseries entailed, he repented o advice. He placed the cenotaph, with its strangely contra representations above and below, in the cathedral during lifetime, and also founded All Souls College, Oxford, in c that prayers might be said for the souls of those who fell i wars. The tomb stands in the aisle of the north transept is architectural in form and is decorated with statues painting. At the extremities of an altar-tomb, supportin effigy of the prelate, are two polygonal towers surrounde two rows of niches with statues and surmounted by a ca The sides are pierced with cinquefoil arches, between whi an emaciated figure in a winding sheet. The tomb was gr marred by the Puritans, and the figures upon it disappe Later some figures of Our Lord and the twelve apostles placed there, but these were quite unsuitable, and have been erected in the position which, it is believed, they origi occupied over the choir-screen on the nave side. All College enjoys the traditional privilege of restoring the from time to time, but until the present renovation ha exercised it for very many years.

ROUND TOWERS OF IRELAND.*

[N selecting the subject of the present paper I have been actuated by a desire to reopen for controversy a subject which appears to have lain practically dormant for at least ome time past. The subject of the "Round Towers of Ireand" is one that would fill a fair-sized volume. It presents imensions and outlines far too wide for the scope of a single aper. To trace clearly even in outline, to compress and at ne same time try to elucidate the fads and the follies of many f the absurd theories put forward would be simply impossible. lowever, I shall try, even imperfectly, to describe the buildngs as I found them, and compare them with the theories of arned gentlemen who have devoted some time and study to ne question, so far as these theories, &c., are applicable to nem. The question is one well worthy the attention of the arned antiquarian and the scholar. It seems to me a pity nat any doubt should exist on the subject, and I fail to see a just eason for doubt, in face of the fact that the dates of the erection f some at least of the towers are recorded in the "Annals of ne Four Masters"—a work admitted by historians of all shades f thought in the kingdom and in Europe to be the most espected, reliable and truthful record of events in Europe toay. To say or assert that the round towers are the conquerors of time" is to express a very great fallacy. At ne present day we have about half the number standing of hich history gives us a record, and these are in different stages f dilapidation and decay, and they also are bound to perish nd pass away with the conquering hand of time. It is true nat a fair number of the towers still lift their heads in sublime randeur to-day, thanks to the fostering care of some private entlemen, our antiquarian societies, and, in later years, the overnment of the country, who have with praiseworthy zeal t last come to the rescue of our ancient monuments. The eriod at which the towers were erected appears to be the real one of contention, and it is to this I would particularly ask your pecial attention. The object for which they were designed nd erected appears to me to be the only question requiring rther elucidation than that which has obtained up to the resent time.

In the early part of the present century the question of the rigin and uses of the round towers received very considerable ttention, and was very well handled by several parties holding iverse views on the subject. In a letter recently received om a very learned reverend friend and historical writer, he ays that, "From the rivers of ink, used in defending one or ther of various opinions of learned men, I turned away with omething approaching disgust; such a lot of rubbish, such a eap of nonsense as has been written on them." There can be o possible doubt entertained as to the correctness and truth f this statement. Tons of paper and barrels of ink have been asted upon the subject by men, many of whom were very arned authors and painstaking historians, but who lacked an ntimate knowledge of the Gaelic race and language and the se and development of ancient Irish architecture, or the rimitive architecture of European or Asiatic countries. It as, with these writers, generally been the case of one comenting upon another in successive stages, combating the ews of their neighbours and predecessors while trying to dvance their own notions on the subject, demolishing one ouse of cards to erect another on its ruins.

So distracting, absurd and confusing were the expressed pinions of every writer on this subject of Irish antiquities in ne early part of the present century, that the Royal Irish cademy (one of the most distinguished and learned bodies of ntiquaries in Europe) offered a gold medal and prize of 50*l.* r the best essay on the "Origin and uses of the Round owers of Ireland." A clause in the conditions of the competion made it incumbent on competitors to make a careful rvey of at least a large number of the then existing remains the round towers, and at the same time to make a careful mparative analysis of the masonry of the towers, and the asonry of the ecclesiastical buildings always found in conection with or adjacent to the towers. It was then for the rst time in the history of the controversy that the subject was ken in hand in a practical way by a practical and educated an, and one who, by the glorious record which he has left us his writings, has proved to the world his fitness for the work hich he undertook to do.

George Petrie, LL.D., R.H.A., V.P.R.I.A., it was, who for ne first time in Irish history cleared away the accumulated bbish of ages with which time had surrounded the round owers. Under the influence of his pen and his brain the ists, the doubts and legendary romance that had up to that me enshrouded the round towers of Ireland were lifted and leared away for ever. The Royal Irish Academy, in 1833, fter careful study and consideration, unanimously voted Dr. Petrie the gold medal and prize of 50*l.*, which he richly nerited.

Dr. Petrie having been engaged on the Ordnance Survey of Ireland, under Colonel Sir Thomas Larcom, enjoyed peculiar facilities for prosecuting his inquiries and research. Sir Thomas Larcom, R.E., superintendent of the Ordnance Survey, gave him every possible facility, encouragement and assistance while engaged on the work, and in the elucidation of ancient Irish manuscript documents he has had the assistance of the two best Irish scholars of the century, John O'Donovan and Eugene O'Curry, also fellow-workers on the Ordnance Survey. In addition to the above-named advantages, Dr. Petrie had free access to and made close examination of the ancient Irish manuscripts and other kindred documents of historical interest, preserved in the British Museum, Trinity College, Dublin, the Royal Irish Academy, and the Arms Office, Dublin Castle, and everywhere else in the country where documents of the kind had been stored and preserved.

It is greatly to be deplored that the documentary treasures mentioned fall far short of the number of manuscripts which might have been preserved, and that because of the wanton and deliberate destruction of such documents by Government officials of bygone days. As regards the destruction of Irish manuscripts, I take the following quotation from Mr. Joseph Salmon's valuable essay on the round towers, published in Belfast, 1886:—"The policy which the representatives of English rule in Ireland pursued towards the Welsh manuscripts, they enforced against the Irish, also visiting our native records with every species of hostility."

Dr. Rothe, Bishop of Ossory in James I.'s reign, testifies in his "Amacleta" (p. 342) that when the alien authorities became aware of a MS. history being in the hands of a private person it was immediately begged or bought, or threats were employed to obtain possession of it if other means failed, so that a man's life was endangered by resistance to their will. He names Sir George Carrew, Governor of Munster and author of the famous work, "Pacata Hibernia," as guilty of notorious robberies and ravages thus committed upon our written records. The destruction which this man wrought in a single province among our ancient memorials Sir Henry Sydney and other deputies extended to the entire kingdom, their conduct encouraging the belief that it formed part of their office to subvert every trace of antiquity in the country (p. 343). Dr. Lynch, who flourished under the three Charleses, avers ("Cambrensis Eversus," vol. i. p. 337) that wherever Elizabeth's troops were quartered they rifled the houses of friends and foes indiscriminately, carrying off all Irish MSS. which they could possibly lay hold of. A dearth of Irish MSS. was thus entailed to succeeding ages.

An excellent Irish scholar, Dr. W. K. O'Sullivan, in his introductory volume to Eugene O'Curry's lectures, says:—"During the first part of the eighteenth century the possession of an Irish book made the owner a suspected person, and was often the cause of his ruin. In some parts of the country the tradition of the danger incurred by having Irish MSS. lived down to within my own memory, and I have seen Irish MSS. which have been buried until the writing had almost faded and margin rotted away, to avoid the danger which their discovery would entail at the visit of the local yeomanry." Numberless cases of a similar character could be given, and were it necessary for purpose of this inquiry, the most reliable English, Welsh, Scotch, German and French historians might be quoted as deploring the loss which the history of Mediæval civilisation has suffered at the hands of official vandals in Ireland.

To those causes must be attributed the mystery and uncertainty which has hung round the tower-building period in Ireland. But in the early part of the present century, with the partial recognition of civil and religious liberty, a happier state of things came into existence. Such of the old Irish documents as escaped the vandalism of bygone days were unearthed with a new enthusiasm, and the contents critically investigated and translated by O'Donovan, O'Curry, Petrie and others of lesser note. Many beliefs entertained under circumstances of less enlightenment were dissipated as devoid of foundation.

Famous amongst the ancient remains whose history had been enshrouded in darkness (a darkness, it might be said, rendered thicker by each succeeding hand which had attempted to dispel it) were the round towers, and to divest them of their robe of obscurity may rank among the greatest achievements of modern archæological science. Mr. Gladstone's Government in 1869 added a clause to the Church Disestablishment Bill, setting aside a small sum of church surplus fund to be applied in preserving Irish national monuments of architectural and historical interest, and about twenty-five monuments were scheduled in connection with this Act. Sir Thomas H. Deane (then Mr. Deane, R.H.A., architect) was appointed by the Treasury Superintendent of the National Monuments, in conjunction with the Commissioners of Public Works in Ireland, who got control of the funds. Several other monuments have in subsequent years been added to the original list, embracing nearly all the ancient buildings in the country worth preserving, including the principal round towers.

* A paper read by Mr. Antony Scott, M.S.A., at the meeting of ne Society of Architects on April 27.

It has been to me one of the most pleasing duties of my life to superintend for a period of twelve years the restoration of these ancient towers and temples of past ages—to trace in the ecclesiastical ruins the rise, development and transition from the primitive tiny quadrangular church with its western doorway, having inclined or sloping jambs, to the beautiful groups of Romanesque monastic buildings of more modern times. This was a pleasing study so far as marking the rise, progress and development of early Christian architecture was concerned, in the same way as we follow Fergusson and other writers of architectural history, who commence with man's primitive efforts to build in stone.

So far as stone-built churches are concerned, there has been no controversy, for all are agreed as to their being the work of the early Christians; but it is not, nor has not been, so with the circumjacent towers, around which so much doubt and uncertainty hangs. It was these buildings which attracted my attention most in consequence of this uncertainty and doubt. If they were the work of a period much earlier than Christianity, I felt sure they would bear the impress of some distinctive features not to be found in the work of more modern times. I provided myself with Dr. Petrie's exhaustive inquiry into the origin and uses of the round towers, Canon Smiddy's, O'Brien's and Keane's works also on the subject, and in this way I commenced a study of these curious buildings which appear to have puzzled generations of Irish historians and archæologists, as well as writers and historians of other countries. I may be pardoned if, after years of close contact with these buildings, I have formed and now give expression to very decided opinions as to the period of their erection.

(*To be continued.*)

SOCIETY OF ARCHITECTS.

THE members' annual dinner of this Society was held on Wednesday evening last at the St. James's Restaurant, Regent Street, W., the president, Mr. T. W. L. Emden, J.P., L.C.C., in the chair. The Lord Chancellor, who was unavoidably prevented from being present, sent a letter of regret. There was a large attendance; among those present were:—The Right Hon. E. Carson, Q.C., M.P., Mr. J. A. Rentoul, Q.C., M.P., Sir James D. Linton, Sir David Evans, K.C.M.G., Very Reverend Dean Langton Geo. Vere, Mr. T. L. Corbett, L.C.C., Messrs. W. T. Madge, C. Martin, J. Classon Preston, A. Murray (City architect), Joseph Randall, C. Welch, M.A., P. A. McHugh, M.P., H. J. Holloway, Ellis Marsland, the Rev. H. G. Pulley, M.A., S. F. Hooper, M.A., J. B. Clark, M.A., C. Berry and A. Mercer, M.A., Messrs. W. C. Williams, O. Marsland, G. Adams, S. Marsland, A. E. Mullins, T. Tofts, F. Sills, Silvanus Trevail, J.P. (vice-president), H. G. Quartermain, Lieut.-Col. Leslie, R.E. (vice-president), Messrs. A. Scott, W. A. Scott, J. Bartlett, D. A. Findlay, A. W. Roques, S. T. T. James, R. T. Symonds, C. E. Butcher, W. Cooper, F. Vallance, J. P. Smedley, W. Lockwood, F. Macey, S. H. Egan, Edgar Farman, W. R. Mallett, G. G. Pye, E. G. Pye, J. H. Richardson, W. Scott Deakin, A. Quartermain, J. Manning, A. R. G. Fenning, E. E. Barks, A. L. Brohier, A. H. Coyle, W. H. Haskins, C. A. Bassett Smith, T. R. Richards, B. R. Tucker, S. C. Cane, F. R. Ohlson, C. F. Skinner, G. H. Seavey, C. Day, E. J. Hammond, G. E. Bond, Dr. Peake, Captain A. M. Leslie and Mr. C. McArthur Butler (secretary).

The toast of "The Queen," proposed by the President, was honoured in the usual loyal manner, and with a vocal accompaniment.

Sir David Evans, in proposing the "Houses of Parliament," said it was not for him to say whether reform was necessary for either of the Houses. If the higher House needed reform, perhaps the lower House did also; but whatever were the faults of these two assemblies, it was evident that as long as they had so many distinguished members of Parliament, so long would the joint endeavours of both Houses meet with the approval of the Empire. They had three distinguished members of Parliament among them that night.

The Right Hon. E. Carson, Q.C., M.P., in responding, said he found himself in a somewhat congenial atmosphere, and it was only natural, for he was the son of a member of the great and noble profession of architecture. In fact, for a time he did study Corinthian and Ionic columns, and had even tried to read plans, but he had not pursued his studies very long. The time he had spent at architecture he did not, however, consider wasted. The first brief he held had to do with architecture and building, and he found his technical knowledge of the subject a great help for getting round the idiosyncrasies of judge and jury. In replying to the toast he had to be impartial on all sides, and he was thus confronted with a difficulty. The House of Lords was presumably an ancient and noble structure, and he did not know whether its architecture could be improved upon; but, taken as an assembly, it had been helpful for the present prosperous cor tion of the Empire. The House of Commons were the rep sentatives of the people, and so long as the members fulfil their obligations towards the people, so long they perform their duty as men. He was not sure that either House l done much for architecture, or had even discussed the quest as to a greater symmetry of the buildings which might ad their cities. A Scotsman did once in the House put a quest as to who was responsible for certain inartistic gargoyles wh had been set up. The First Commissioner of Works, w replied to the question, said that he was not responsible any ugly appearances either outside or insi de the House.

Mr. Manning gave the toast of "The Clergy." They w a body, he said, who were the guardians of some of the b buildings in the land, and men who generally appreciated ability and wisdom of architects.

The Very Rev. Langton Vere and the Rev. H. G. Pul responded.

"The London County Council," a toast proposed by M Ellis Marsland, was responded to by Mr. T. L. Corbett, L.C Mr. Corbett said, in the light of some recent architectu criticism which had been passed on the efforts of the Cou Council, it required courage for a member of that body appear before a society of architects. He could only pr himself, however, that the tide of criticism had rolled fart down the Thames.

Mr. J. A. Rentoul, Q.C., M.P., proposed the "Society Architects and Architecture." He said there was abund proof that architects were worthy of the toast, and they h many claims to respectability. Their president had the hon to be the brother of a county court judge, and Mr. Carson w the son of an architect. The architect was even mentioned literature. The greatest writer in English had sketched ma characters, but one of his strongest was Pecksniff. It w lamentable, notwithstanding these great claims to a promin place as a profession, that architectural works of past a which existed to-day could not be equalled by modern tim This showed that architecture was not a progressive a whereas law had progressed, indeed to such a degree tha sometimes became bewildering. Speaking seriously the speal said it was to be regretted that an architect had more often work for his living than for his art, and sometimes even for t smiles of a patron. This was not an encouragement for gr work. There was no building more condemned than the L Courts. Where did it fail? The rule laid down in its c struction was that there should be easy access to each roo and it was thus the fault rested with the man who made t rule which spoilt the architectural work.

The President, in reply, said the Society's purpose w first and foremost for the registration of architects, which wo give the profession a better standing. The result of suc measure would also do much to prevent what was wrong a false in architecture. The profession also felt the necessity an authority that should deal with the way in which build should be carried on to benefit the public at large. Archite felt the hardship of dealing with several bodies on such poi and their Society wanted to make the law dealing with su matters more simple. In Scotland the Guilds Court was a to deal satisfactorily with such questions, and on much the sa rules it would answer in England. Whatever benefited t profession benefited the public at large.

Mr. Silvanus Trevail, who proposed the "Arts and Cra allied to Architecture," spoke of the meanness in ornament the public buildings, and hoped that with the new Governm buildings which were to be erected, more would be done towa their embellishment in the way of sculpture.

Sir James D. Linton, who responded, said, when he recal the position of the allied arts and the advancement that l been made by private means and opportunities in spite of ma drawbacks, they had much to be proud of. The relation of decorator and the architect was an interesting point. It h been said that the decorator should be under the direction the architect. That was a right conclusion, but it should n exist, because in the old days there were no painters or deco tors who were not just as able architects. Among a num of instances the name of Michel Angelo might be mentio as a painter or decorator-architect. There was a difference feeling among architects and painters, and by closer comra ship painters desired to overcome this difficulty.

Mr. Joseph Randall also responded.

The toasts of "The Visitors" and "The Press" followed

A charming musical programme under the direction Mr. Albert Fox gave a further stimulus to a very succes evening.

The Autumn Congress of the Sanitary Institute will held this year in Southampton, by invitation of the Mayor a Corporation, commencing on August 29.

THE DECORATION OF ST. PAUL'S.

THE following protest has been sent from the Society for the Protection of Ancient Buildings, 10 Buckingham Street, Adelphi, W.C. :—

To the committee for the decoration of St. Paul's Cathedral.

"My Lords and Gentlemen,—The Society for the Protection of Ancient Buildings is very anxious to urge upon the committee for the decoration of St. Paul's Cathedral that the work has now reached nearly the only point which will occur of resting and reconsidering their aims.

"At the present time the nave and the transepts in a large degree represent the church as left to us by Christopher Wren; any injuries which these great portions of the building have sustained have been very much of the nature of accidents done in what we may call the days of ignorance, they have not been parts of a deliberate scheme for altering the general character of this great interior. Moreover, it is quite consonant with now ruling ideas of propriety to subject the eastern limb of a church to treatment separate from the nave and transepts, so that, as we have said, the work of decoration could be concluded now without any sense of incongruity arising from a supposed lack of completeness. This course the Society ventures most respectfully and earnestly to urge upon the committee as opposed to any course in the nature of a compromise —such as continuing the works on a tentative or less extensive scale. The thing most worth considering is, in the opinion of this Society, how to preserve a large portion of the building in the state in which we of this generation have known it, with all the effect of spacious restfulness, so greatly due to the soft mellow colour of its magnificently wrought masonry.

"In speaking thus the Society does not refer only to the mosaics, but to all the works which have for their aim, not the protection and care of Wren's work, but the correcting and improving it, as is supposed, into something better.

"There is evidence on the north-east pier of the dome that it is intended to run an iron verandah railing all along the great cornice, and to do this would be such a fatal worrying of the interior that we can hardly suppose the committee will consent to it now the trial piece has been put in position.

"The retention of the plain white glass in the remaining windows, the Society considers, is of the utmost importance—first of all from its authenticity and from the character and feeling agreeing with Wren's work, of which it is part, and secondly from the need for white light not only for its own sake (and that is evident enough), but so as not to alter the lovely colour and tone of the ancient stonework.

"Any tampering with or wounding of the surface of this stonework comes as a shock, even if it be though so small in degree as the insertion of the bracket under Mr. Watts's picture.

It is not a part of the duty of this Society to criticise the mosaics and colour decoration on their merits, but simply to point out that they are revolutionary beyond all anticipation of probability, and entirely destructive of the ancient character of reverential peace possessed so lately by the Cathedral of London.

"In conclusion, the Society ventures to hope that its well-known interest in the preservation of ancient buildings will be considered a sufficient justification for troubling you with this communication.

"Signed on behalf of the Society for the Protection of Ancient Buildings.

"Geo. Rutter Fletcher, } Secretaries.

"April 21."

GLASGOW ARCHÆOLOGICAL SOCIETY.

THE monthly meeting of the Glasgow Archæological Society was held at 207 Bath Street, on the 20th inst. Principal Story presided.

Mr. P. MacGregor Chalmers read a paper on "The Early Fabric of the Cathedral, with Notes of his recent Excavations." A short historical sketch of the early structures was given, bringing out prominently the probable relationship of each to the site of St. Mungo's Altar in the saint's own church. Under this altar doubtless the saint was buried. The site may be recognised to-day in St. Mungo's Shrine. The church—the choir only—founded by Prince David, was described as being necessarily in the Norman style, of the type of Dunfermline Abbey, or of much of the work at Durham. This choir must have been destroyed at an early date, since there is evidence that a second choir was erected in the time of Bishop Ingeham (1164-74). Of this fabric an interesting fragment remains in the old wall shaft in the lower church, marking doubtless one of the angles of the apse of this early south aisle. To this choir Bishop Joceline began to add a nave. Wynton says he enlarged the church in 1181. As the choir was again destroyed this work was interrupted. Of Bishop Joceline's restoration a great deal more remains than is currently supposed. The north wall of the north aisle, the lower part of the north and south transepts, the general arrangement of the present vaulted landings leading to the aisles of the upper church, and almost the entire south aisle of the lower church, with its walls and vaulting, are of this period. This part of the description was assisted by a series of large drawings of all the mouldings. The object of the recent search under the floor of the cathedral, which was undertaken by permission granted by the Government, was to determine if, happily, any part of the ancient foundations had been allowed to remain. As a preliminary to this description, Mr. Chalmers indicated the results of a similar search at Jedburgh Abbey carried out by him some time ago by the kind permission of the Marquis of Lothian. At Glasgow the search went to prove that all the old foundations had been removed. It was doubtless found necessary to do this owing to the method adopted for the foundation of the present cathedral. It was found that the pillars are not carried down below the pavement level as pillars. A great wall, about 8 feet thick, seems to run continuously the whole length of the choir from east to west. It goes down a great depth, and reaches, at the top, to within 9 inches of the floor. The four pillars of the shrine are also founded upon a four-square wall. One of the other interesting discoveries was the finding of two of the original glazed red brick floor tiles. These were exhibited at the meeting, and were compared with almost identical tiles found at Glenluce Abbey, which Mr. Chalmers is at present engaged repairing. A series of interesting photographs were shown. These included one of the painted panels on the vaulting of the church. This contained four of the ten commandments. The fourth reads—"Remeber thow keip holy ye Saboith day." The last photographs shown were several of the remarkably beautiful carved bosses in the lower church, each carved with a beautiful face, undoubtedly portraits. The identification of the persons represented was to a large extent free from difficulty. One is a portrait of Bishop William de Bondington, who built this part of the church; another is a portrait of King Alexander II., who died in 1249. The other two portraits, those of a man and a woman, may be identified as Isabella de Valloniis, lady of Kilbride, and Sir David Comyn, her husband. These carvings are unique in the cathedral. They can hardly be considered in any other light than as a record in stone of a great benefaction. Mr. Chalmers referred to other such records in the cathedral. Isabella de Valloniis granted her "whole land which is called the forest of Dalkam" to the bishop and the church of Glasgow, before 1250. The charter was confirmed by John de Balliol on September 14, 1250.

CRYSTAL PALACE ENGINEERING SCHOOL.

THE certificates awarded by the examiners for the Easter term of the Crystal Palace Company's School of Practical Engineering were presented on Saturday in the lecture theatre of the school. Sir John Jackson, F.R.S.E., associate of the Institution of Civil Engineers, took the chair. Mr. R. G. Hodson, superintendent of the Crystal Palace School of Art, Science and Literature, read the lists of awards and the reports of the examiners.

Before presenting the certificates Sir John Jackson said he was delighted with what he had seen in the school, particularly in the mechanical workshops. In his opinion no engineer had had a sufficient training unless he had spent a considerable time in workshops or on works in progress. To show the advantage of practical knowledge, he said an engineer gave a drawing to a contractor for an iron bridge, saying that it must be strictly followed, and was greatly surprised when the contractor pointed out that when certain rivets had been put in the man doing the work would be caged up. He (the chairman) spent three years in an engineering factory before taking the civil engineering course in Edinburgh University. He had always looked upon those three years as a most useful training. Those who would have to do with workmen in later life would find workshop experience important. But on the whole, perhaps, it was better to get the workshop training in a school like this at the same time that they were getting their class-room training.

Mr. J. W. Wilson, principal of the school, in thanking the chairman for his attendance, remarked that many old students had posts in Africa, and that one of them, Beringer, was engaged in carrying out Mr. Cecil Rhodes's trans-continental telegraph line.

The Chairman, in replying, said that when he was at Edinburgh he had three intimate friends among the engineering students. One of them tried his best to be an engineer, but he was not made for that vocation, and he then turned his attention to literature, in which he reached the top. That student was Robert Louis Stevenson.

The Design of Mr. W. V. Gough has been adopted for the new Free Library in Bristol.

NOTES AND COMMENTS.

IN connection with the Paris Exhibition of 1900 several international congresses will be held. There will be twelve principal sections, and the subdivisions will afford opportunities for many varieties of meetings. The sections are education, fine arts, mathematical sciences, physical and chemical sciences, natural sciences, medical sciences, applied mechanics, agriculture, political economy, social sciences including sanitation, colonisation and geographical sciences, industry and commerce. Religious and political subjects cannot be discussed at any of the meetings. The International Congress of Architects will have for president M. ALFRED NORMAND; vice-presidents, MM. FRANTZ BLONDEL, CHARLES LUCAS, OCTAVE COURTOIS-SUFFIT; general secretary, M. MAURICE POUPINEL; secretaries, MM. GEORGES ROUSSI, HENRI PUCEY, ALFRED NEWNHAM; treasurer, M. CHARLES BARTAUMIEUX. The five members of the permanent committee with other additions form an executive commission as follows:—MM. CHARLES BARTAUMIEUX, FRANTZ BLONDEL, ADRIEN CHANCEL, OCTAVE COURTOIS-SUFFIT, HENRI FERNOUX, C. M. GARIEL, ALPH. GOSSET, FRANTZ JOURDAIN, LÉON LABROUSTE, EDOUARD LOVIOT, CHARLES LUCAS, ALFRED NEWNHAM, ALFRED NORMAND, J. MAURICE POUPINEL and GEORGES ROUSSI.

AMONG the few enterprises in which Irishmen, without distinction of creed, race or party, would unite is the supporting of the memorial to the Treasury praying that the Civil List pension of 100*l.* per annum, which was enjoyed by the late Mrs. HOGAN, widow of the Irish sculptor, JOHN HOGAN, may be continued to his three daughters. Two of these ladies, who are well advanced in life, are invalids, and the third is occupied in personal attendance on them. The story of the father's life must always find a place among those which relate to the vicissitudes of genius, and is not without interest for our readers. He was a builder's son, and was born in Tallow, co. Waterford, in 1800. It was a strange place to produce a being who was to be endowed with a Greek's sense of severe beauty, but hardly more so than was Ennis, where another artist with the love not only of form but colour, WILLIAM MULREADY, was born. Nature has freaks of dropping seeds on unsuitable soil. HOGAN'S father aspired to see his son "a gentleman," and when he was twelve he was placed in an attorney's office in Cork. In that city he saw a famous collection of casts belonging to GEORGE IV., and by which MACLISE, FORDE, O'NEILL and others educated themselves. HOGAN also drew them, and as THEMIS is jealous, he was declared to be unfitted to fill up forms of summons and process. Fortunately he was able to obtain employment from Sir THOMAS DEANE, who was then and long afterwards the chief architect in the south of Ireland. HOGAN'S ability was perceived, and he was enabled to prepare models for carvers. When he was twenty-three a carving in wood by him and models of other works were seen by Mr. CAREY, who was one of the few art critics of the time, and he appealed so powerfully to amateurs that a sum of 250*l.* was obtained to enable HOGAN to visit Rome. He made the ancient city his home until 1848, when the political disturbances compelled him to try his fortunes in Dublin. He produced works which were equal to any by THORWALDSEN or GIBSON, but as they were mostly for Irish patrons there was the inevitable difficulty about paying the price agreed upon. The ecclesiastics were the most unsatisfactory of all his patrons in that way. When HOGAN settled in Dublin a suspicion arose that he belonged to the revolutionary party in Rome, and he was not welcomed as he merited. Commissions on which he had a right to count were sent elsewhere, regardless of the consequences which were to arise from setting up terrible figures like that of MOORE, the poet, in the streets. HOGAN'S heart was broken by the conduct of his countrymen, and he died in great poverty. The Government came to the rescue of his family with a pension of 100*l.*, and on it they have lived. The sculptor was a man of whom any country might be proud, and we hope his tragic history will not be supplemented by a record of his survivors' dependence on public charity. The collection of casts from his works which can be seen in Cork is the best evidence of HOGAN'S genius, and should be enough to satisfy the most exacting critic of the sculptor claim to be ranked among great artists. As such there is duty from the country to his representatives.

IN England we do not expect to see philanthropi building societies described as "licensed victuallers," bu the law in Ireland compels the use of the phrase. Ther is an "Association for the Housing of the very Poor," an it has a wide field for its labours in Dublin. At preser there is not money enough to start a building, and mear while an effort is to be made to acquire buildings and t put them into habitable condition. But many people hav hesitated to support the venture because in the memorandur of association the words "licensed victuallers" appear There is no intention of selling intoxicants, but the solicitor insisted on the insertion of the words in order to give th company power, should occasion arise, to acquire licensed premises in connection with suitable blocks of houses. I the St. Giles's district many houses were transformed, bu we never heard of Miss OCTAVIA HILL finding it necessar to become a victualler. We suppose they are stronge sticklers for the letter of the law in Dublin than in London

---

FORTY or fifty years ago the late JOSEPH WOLF, who died on the 20th inst., was one of the specialists for th illustration of books and periodicals. For drawing some varieties of birds he was without a rival. There was no artist of the time who was better able to represent the delicate plumage of birds of paradise, and he was therefore much in request for such splendid works as those produced by Mr. GOULD, Mr. GOSSE and Mr. GRAY, which are now o enormous value. He also illustrated several other works in which birds or wild animals were described. LANDSEER testified to his remarkable powers and accuracy. By birth he was a German, and was born near Coblentz in 1820 In his youth he exemplified the passion which Mr. RUSKIN desired to see among Englishmen—that is, the drawing o birds instead of shooting them. He was apprenticed to a lithographer, and as soon as he became competent he was entrusted with the decoration of a large book on falconry by Professor SCHLEGEL. His success obtained for him an invitation to this country, and for fifty years he was appre ciated as he deserved. His water-colour drawings were exquisite, but as they were treasured by collectors they were rarely seen in auction-rooms. Although the public were not acquainted with his work in colour, there are severa books which will always be prized for the illustrations which the genial artist furnished them with.

PARIS without its equestrian statue of JOAN OF ARC in the Place des Pyramides hardly appears to be itself. Of late years there was no work which attained more popularity. All parties felt kindly disposed towards the heroic girl, and among the numerous representations of her that is the most popular. The second version which M. FRÉMIET produced, and which is set up in Nancy as if defying Germany, has not appealed with equal force to popular sympathy. It was necessary to temporarily remove the equestrian figure which is so dear to Parisians. It was in danger. The ground of the Place had to be opened for municipal works, and it was found the pedestal had afterwards settled. That might impose a strain on the bronze, and be injurious to M. FRÉMIET'S work. Until there is an assurance of security the horse and rider will remain with the founder. The sculptor will take advantage of the opportunity to apply a new coating which he believes will preserve the bronze and restore it to its original condition. It would be an advantage if the authorities in London and the provincial cities could borrow M. FRÉMIET'S new patina, for the English climate is merciless towards bronze statues.

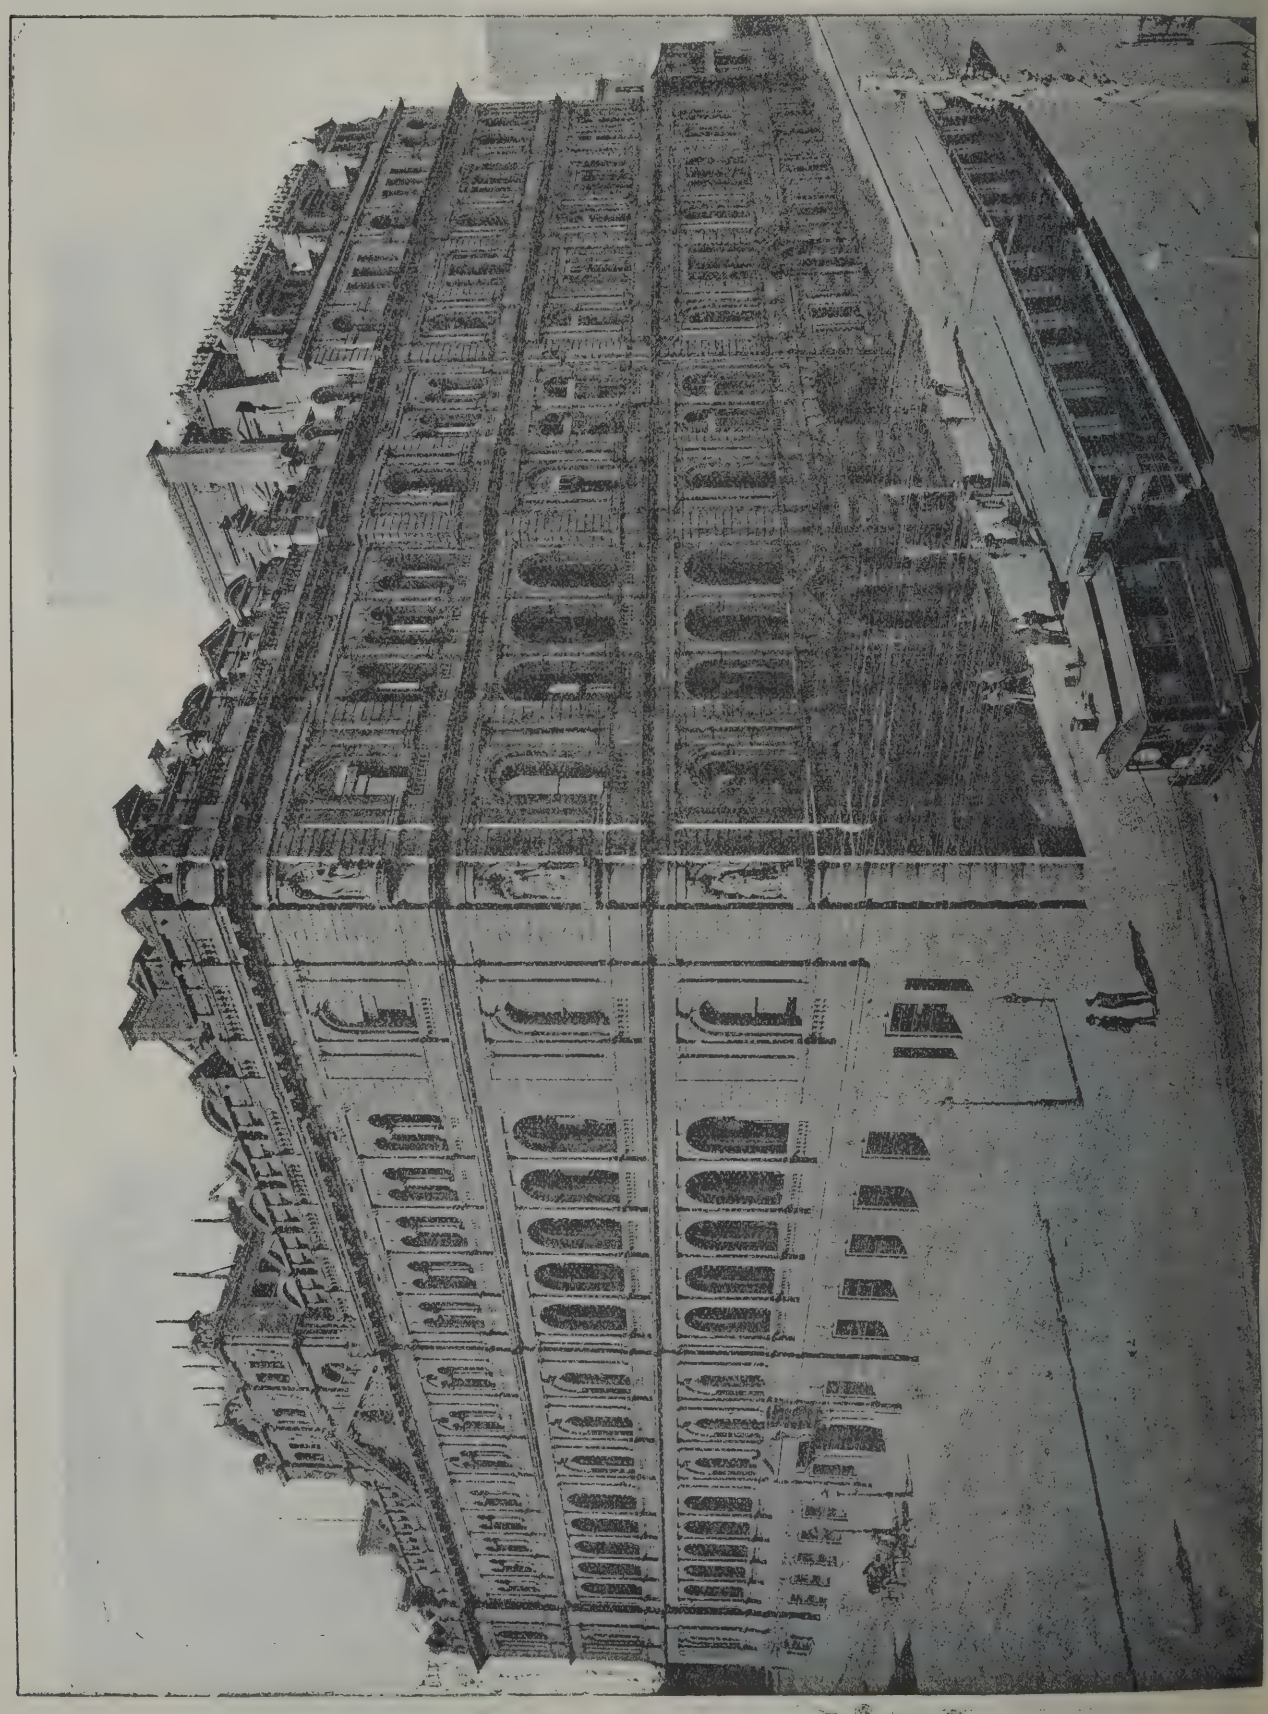
AUSTRALIAN ARCHITECTURAL NOTES.

[From a Sydney Correspondent.]

ALTHOUGH a distinctly Australian style of architecture has yet to be evolved, many of the public and private buildings in the leading colonial cities display an amount of taste, and even elegance of design, for which a stranger would hardly be prepared. There is, perhaps, too much imitation of European work, but there are not wanting indications of a tendency to depart from the conventional, and adopt styles harmonising with Australian climatic conditions.

In New South Wales, the paradise of colonial architects, the earlier buildings were constructed in accordance with climatic requirements, the principal features being broad verandahs and dark rooms, the latter being supposed to exclude mosquitos, which they did at the cost of fresh air and ventilation. Later on the broad balcony was introduced, but colonial architects, finding their way from the United Kingdom, instead of adopting the bungalow principle in preparing their designs, had resource to styles with

Court House, Darlinghurst, Sydney.



New Police Court, Sydney.

which they were familiar in the mother country, but which were somewhat out of place in a country like Australia. The court-house at Darlinghurst, Sydney, affords an illustration of this. Although designed from Classical models, it is a dull, heavy-looking affair, with a badly arranged interior. It is not a prison; it is simply a place of trial, adjoining the principal gaol in the colony. In later structures of a similar class the Italian style has been largely used, with a view to securing an air of lightness combined with strength and durability, an example being afforded by the recently constructed police court in Sydney.

In the public buildings of the colony the use of loggia in place of the balcony is especially noticeable. The Public Works Department, Sydney, is a characteristic illustration of this. Unfortunately the interior, a perfect chaos of narrow, dark passages, inconveniently placed staircases and ridiculously small chambers, is less impressive than the exterior. There are, however, two or three rooms of fair proportions, in one of which the meetings of the Colonial Executive Council are held.

(To be continued.)

THE SOUTH LONDON ART SCHOOL.

THE following is the report of Mr. John Sparkes to the Governors of the City and Guilds of London Institute on he South London Technical Art School for 1898 :—

The most peculiar feature of the year's history was the ompetition for a travelling studentship among the past holders f the 100*l.* scholarship, which resulted in the selection of Mr. Bramwell as the best of the competitors. Mr. Bramwell has ravelled abroad during five months, he has seen the principal istorical buildings and collections in Italy that have a bearing n the art of the world—having spent three months in Naples, Rome, Milan, Venice, Genoa, Perugia, Arezzo, Siena and Florence. In all these places, rich with objects and buildings hat have been, and are, the sources of vitality in the growth f all the arts in Europe, he has sketched with discrimination, nd further has very wisely provided himself with the ecessary material and experience in the use of it, to ake photographs of those details or masses that are difficult o represent in a sketch without an abundant amount of ime. He has also expended some of his allowance in he purchase of photographs of such objects or buildings that ave been recorded by that method. After leaving Italy he ent to Germany and studied in Zurich, Munich, Dresden, Breslau, Berlin, and returning through Brussels completed hat must certainly be an education in the object lessons of is art, that will stimulate his artistic gifts and guide them in eir development. Mr. Bramwell had the advantage of aving had a very thorough training in the art and technical ections of his craft, and to him a journey such as he has ade comes to confirm him in good methods, and what is also nportant, to give him the inestimable advantage of studying e true local aspects of what is questionable or bad in the rts of the ages of decadence. While abroad he met Mr. utland, who was able to travel with Mr. Bramwell with the ratuity this committee had voted him as a recognition of his erseverance in the last five annual competitions for the holarship. He, too, has made his journey by way of Paris nd Dijon to Turin, Pisa, Rome, Naples, Siena, Florence, istoja, Bologna, Padua, Venice, Brescia, Verona and back by Milan and Paris. I have asked these scholars to write a short port of their travels, with the view of putting on record their periences.

They met in Florence Mr. Turner, a past student of the hool, who is travelling in Italy with the 200*l.* scholarship of e Royal Academy—this is an additional privilege that is warded with the gold medal of that institution. Besides the reat prize of the gold medal and the above scholarship, Mr. urner took the silver medal for the best three figures modelled om the life, which carried with it 50*l.* His work was so autiful and academically so correct as to encourage the lief that in a few years Mr. Turner will be in the foremost nk of our artists. Further, they also met Mr. Watson, who as travelling with the 50*l.* scholarship awarded by the South ensington authorities in connection with the Royal College Art. Mr. Watson was for some time a student of the uth London School in the painting and figure classes. It ems worth noting that Mr. Watson's ambitions as a painter id designer have received such an important stimulus.

I have dwelt somewhat at length on the very valuable ljunct to the great educational advantages offered by the uth London School these travelling scholarships afford, in e hope that they may be repeated occasionally, as I am rtain that no greater or better form of education exists than avel, when the student is sufficiently forward in his studies and ilful in his craft to profit by the great lessons that are thus ught him.

There are six students who hold a scholarship from the unty Council of 20*l.* a year for three years, and two others ho hold a scholarship of 10*l.* for two years.

I attach Mr. Frith's and Mr. Tyrrell's reports, which deal th the present condition of the classes, and confirm my own pression of the great advantage of foreign travel.

During the year the students have been aided by critical vice on their sketches by many gentlemen of position and gh practical experience, and thanks are especially due to essrs. Harry Bates, Gascombe John, Stephen Webb, Roscoe ullins, Stirling Lee, Edward Lauteri and W. Brindley for eir kindness in coming to the school and giving their best inion on the work submitted to them.

Mr. Frith writes :—

"I am pleased to be able to report that the attendance at e modelling classes of the above during 1897-98 has shown an crease on previous years ; this is especially gratifying when is remembered there are now several more schools within each of the district than was formerly the case.

"The sketch club has shown an increase in the number of ontributions at the monthly meetings.

"The life class is quite the largest we have had, and the ork is of a good and promising character.

"The success of Mr. Turner in gaining the gold medal of e Royal Academy has had a good effect, both in demonstrating the value of earnest, conscientious study, and in stimulating others to follow him, as he also has followed those who have previously gained the same distinction.

"The career of this student should be particularly gratifying to the Council of the Guilds, as he was so situated as to be entirely dependent on his own exertions ; and his gaining the school studentship was the means of affording him the opportunity of continuing his studies in the direction where he has gained his honours and laid the foundation for what should be a distinguished and successful career. Had this studentship not been in existence, he would probably have either become a dissatisfied workman or have arrived at his present position after a wearing and enervating struggle.

"The studentship competition, it may be remarked, has each year increased in importance, and has brought out a greater amount of work, and that of a higher quality. On the last occasion there were at least three works, either one of which had quite sufficient merit to justify the award of the prize.

"The grant of the 25*l.* travelling studentship, taken as a recognition of work done will no doubt be of benefit to the school. There is often in a school a student whose abilities and personal qualities dominate to the extent of making others abstain from competing as hopeless, or they are so impressed by the odds they suppose to be against them that strained effects result in their work. An occasional consolation prize distinctly contributes to favour the quiet working that produces the best work by in a way saying, 'All is not lost even if you do not come in first.'

"The two students travelling have received an experience that should be of great value : their report will no doubt show they have endeavoured to get the fullest benefit from their scholarships.

"It seems to me that it is advisable that the granting of a travelling studentship periodically should become a part of our system, since this is well calculated to complete the education of our best students to the point at which they may safely be turned loose. It is to be remembered that although in the art they are studying much has been done, there is room for development in many directions, and much remains to be done.

"In viewing the work of other ages and countries the student will find some of the difficulties that have baffled him successfully overcome, and he will see others which have ceased to be difficulties to him in conditions where they have been abandoned as insoluble or only partially mastered ; his knowledge will be broadened, and he will gain the hope, confidence and discrimination best suited to inspire, invigorate and guide him in his career.

"The exhibits at the Royal Academy numbered about twenty, several of them of the first importance, as Mr. Frampton's 'Memorial,' Mr. Gascombe John's 'Elf,' and Mr. Pomeroy's 'Perseus,' &c.

"Mr. Frampton is engaged on a statue of Her Majesty the Queen and other works, Mr. Bates on a companion monument to his 'Lord Roberts,' Mr. John on a statue to the late Duke of Devonshire, for Eastbourne. Mr. Tweed has just finished the models of some important reliefs for a monument to Cecil Rhodes. Mr. Allen has just completed his two panels for St. George's Hall, Liverpool, and others. I believe all are in their degree making the best use, according to their opportunities, of the abilities the school has in the first instance assisted to develop."

Mr. Tyrrell reports :—

"I am happy to say the past session has been marked by increased attendances in both life and ornament classes. The sketch club has also shown great energy.

"One student—Hartwell—has gained admittance to the Royal Academy schools.

"Two others have been entrusted by architects to carry out work on buildings—Broadbent, on some schools at Brighton, and lately interior decorations for the Cape.

"Lloyd, some carving on a church in Wales.

"The last Academy Exhibition testified to the activity of past and present students, twenty-one of the exhibits in sculpture coming from their hands.

"Mr. Bates, A.R.A., is busy on an equestrian statue for Bombay, with other commissions.

"Messrs. Frampton and Pomeroy are also very busy, and Mr. Allen has successfully accomplished his large sculpture panels for St. George's Hall, Liverpool.

"I may also mention that Mr. Broadbent has been appointed teacher of modelling and design at the Westminster School of Art.

"And Mr. Thomas is similarly to teach modelling and wood-carving at the Cheltenham Schools."

Mr. Fripp's report deals with his life and composition class, to which I can only add my confirmation of its zeal and hard work. The large majority of his students are seeking to make their way as illustrators. Therefore the composition class (which I take myself) is an important factor to the proper

teaching of the school. I can say that the work done in this class is really excellent, it is clever, and what is more important it is systematic and well-educated work. That we are on the right line in this regard is shown by the very high positions taken by our past students—who are now leaders of their profession.

Mr. Fripp writes :—

"It is a great pleasure to be again able to report that the work carried on in my department of the school during the last ten months has been eminently satisfactory; the attendance of the students, especially in the autumn and spring terms, has been most regular.

"Amongst our present students, two have gained County Council scholarships of 40*l.* for two years, and one, Mr. Nelson, has especially distinguished himself by obtaining an Extension, value 60*l.* for one year, taking second place on the list after a severe competition. Mr. Stevens has obtained a valuable appointment under Professor Thompson at Oxford, for three years, as an anatomical draughtsman ; Mr. Affleck exhibits three pictures at the Royal Academy and two at the Royal Institute, all on the line ; lastly, Mr. Aveline, one of our Free Students' Medallists, has obtained admission to the Royal Academy Schools, and within six months been promoted to the Upper School. Altogether the work of the school is in a most healthy condition, and is showing excellent results in response to the benefits the institution affords. I may add that the number of our students engaged in illustrative and decorative work of a high class continues to increase."

Mr. Stevens's report on the house decoration class speaks for itself. The fact that our students have to leave to take up appointments before they have received all they could get from the school is to be regretted, but as they are preferred or promoted in consequence of the knowledge they have obtained in our studios, the regret is at least modified ; but this rapid promotion deprives the class of the mature students who are so valuable a constituent of every art school.

Mr. Stevens reports as follows :—

"In making my annual report, I have to say the house decoration class is becoming more widely known and appreciated by the workmen it was formed to assist in acquiring the technical knowledge necessary for them to possess in the various branches of the trade. It is found to-day that owing to the keen competition and the improved methods of working, that practical skill and theoretical knowledge are absolutely essential to enable a workman to hold his own, and this is the more felt by that class of young men (and their number is increasing daily) who intend to make our colonies their home in the future.

"I frequently receive very gratifying information from those who have gone away of the benefit they derive from the work done at the class.

"I do not think there is anything very special to report this year—all the students have worked well, and one, Mr. W. C. Smith, has been appointed manager to the decorative branch of a firm in Sevenoaks, Kent.

"I still think it would be well to have a few large bills posted in the neighbourhood similar to those of the County Council and the polytechnics, to bring the class still more to the notice of people in the trade, for strange as it may appear, so ingrained is the conservatism in matters connected with their business, that one workman will very rarely give any information to another workman that may tend to make him a better mechanic ; they say, 'Find out, as I had to'; and so it is only by means of technical schools that these absurd barriers to craftsmanship can be broken down and the young man be given a fair chance of success on his way through the world."

I have to report that the studios and plant are in good condition, but the wear and tear is great and necessitates annual cleaning, whitewashing, painting, &c. The attendance of students has been regular and the teachers have been zealous and careful to develop the individuality of their students.

TECHNOLOGICAL EXAMINATIONS.

THE report on the work of the Technological Examinations Department of the City and Guilds of London Institute contains the following information concerning the building trades sections :—

In all branches of the building trades there has been a marked increase in the number of candidates for examination, and in most of the subjects a similar increase in the attendance of students at the registered classes. In carpentry and joinery the attendance numbered 2,837 against 2,676 last year ; in brickwork 629, against 571 ; in masonry 431, against 385 ; in plasterers' work 83, against 56 ; whilst in painters and decorators' work the attendance has fallen from 603 to 549. In all the foregoing subjects, however, the number of candidates for examination has increased—in carpentry from 1,080 to 1,224 ; in brickwork from 293 to 397 ; in masonry from 188 to 259 ; in plasterers' work from 20 to 40 ; and in painters and decorator work from 172 to 188. These results must be regarded as ve satisfactory. The percentages of passes show, too, on t whole, an improvement in the work. Specimens of practic work were sent in from 123 honours candidates in carpent and joinery, and from 46 in painters and decorators' work, which latter subject a practical examination was held this ye for the first time. For the optional practical tests in brickwo and masonry 19 and 9 candidates respectively presented ther selves, whilst 386 candidates entered for the practical test plumbers' work, which, according to the new regulations, w be made an obligatory part of the examination in both t ordinary and honours grades. In brickwork and masonry t attention of candidates is called to the examiners' request th they will state in what part of the country their experience h been gained.

The following extracts are from the examiners' reports :—

Carpentry and Joinery.

Preliminary.—Speaking generally the candidates failed satisfy your syllabus. Signs of hasty preparation were n wanting in the pupils. The candidates seemed to have co cerned themselves more with the technique of the trade tha with the principles of drawing, geometry, mensuration a mechanics, which should more properly be the object attention by an elementary candidate. There were, howeve signs in the papers that teachers are becoming alive both the weakness and to the necessity for improvement, so tha with the firm pronouncement of the views of the Institute the syllabus and examination papers as a guide, we may reaso ably hope for much improvement in the near future. We mu not omit to observe that a fair number of the papers were ve well done, and a few were extremely good.

Ordinary and Honours Grade.—On the whole the candidat show a fair knowledge of the subjects, particularly in t Ordinary Grade, although it would have been better in ma cases if the candidates had taken the preliminary course secure better draughtsmanship. In the honours grade v found that generally the practical work was good, but the were many exhibits to so small a scale that no detail could shown.

Brickwork.—There is a great improvement in the ordina grade, due perhaps to the reduction in the number of questio to be answered. Allowance has been made as much possible for local practice. Hence it will be seen ho important it is that the candidates should state where th have gained their experience. Most of the North of Engla candidates show but a very slight knowledge of cut and gaug work ; and, whether it be for hard or soft material, this shou receive serious attention. It is to be regretted, too, that few candidates show a satisfactory knowledge of the science bonding, as evidenced in most cases by Questions 7 and ordinary grade. Students should be taught to answer t questions intelligently and in the order given : thus, if the are three points in a question, they should be answered firs second, and third concisely. The honours candidates a below the standard in general knowledge, and much mo attention should be given to drawing. One candidate only w fairly successful in answering No. 9.

Masonry.

Some of the honours papers are most satisfactory, but it to be regretted that more attention is not given to the charact and composition of materials and the effects of atmosphe on them. There appears to be among some of the candidat an impression that a knowledge of materials need not for part of a mason's training, but this is very much to be depr cated. The geometrical portion of the examination paper w poorly answered, and we think that some attention might called to this fact, as it is one of the most important subjec for masons. One cause for candidates not receiving so mar marks as they otherwise might is that they do not state whe they gained their experience, and thus different local practic cannot be allowed for.

Plasterers' Work.

The standard in the Honours Grade is not so high as th of last year, though those to which first and second prizes a awarded show considerable ability, the first being very practic in its nature, probably the outcome of much experience.

The papers in the Ordinary Grade are above the average those of last year, for, though no one paper is better than the be of last year, there are in this competition several of almo equal merit with the winner of the first prize. Taken altogethe the Ordinary is a much better competition than the Honou Grade.

Painters and Decorators' Work.

Ordinary Grade.—The papers, considered as a whole, a very fairly satisfactory, a number of them showing clearly th the candidates have been instructed in a practical manner, a have been taught why the different materials used in paintin and decorating are employed, and why the successive steps

xecution of the work are taken. Many papers, however, eave much to be desired in these essential particulars, and ppear to indicate that the instruction has, to a great extent, een limited to the actual methods of executing painters' work. The answers are more unsatisfactory in the following subjects han in any others included in the syllabus :—Dryers—In nany cases the proportion in which they should be used is mperfectly understood. Distemper—There is a general want of knowledge on this subject. Writing—The form and spacing of letters is most imperfectly understood.

As this examination (Ordinary Grade) is wholly a written ne, it is suggested that teachers should themselves from time o time set questions and require written answers from their upils, so as to train them to explain clearly what they know of he subject.

Honours Grade.—While many of the papers show knowledge and training, they fall considerably short of the high tandard of excellence necessary for securing a certificate in his stage. The principles involved in the different processes of painting are, it is evident, in many cases but imperfectly nderstood.

The answers are more unsatisfactory in the following ubjects than in any others included in the syllabus :—Gilding n Glass—The best method of executing this work is not well nderstood. Decoration—The most serious shortcoming of a najority of the papers is in the theory and practice of colour nd in the recognition of the good and bad in ornament ; the ractical examination brings out these shortcomings very conpicuously. Inasmuch as the art of decoration is based upon a roper understanding of colour harmony, it is earnestly hoped hat more attention will be given to this subject in the future.

THE GLASGOW EXHIBITION OF 1901.

ON Saturday last the first sod was cut preparatory to the construction of the foundations for the International Exhibition of 1901. The site is to be in Kelvingrove Park, where the Exhibition of 1888 was held.

Before the ceremony, Mr. Shearer, chairman of the building ommittee, said that the Exhibition buildings were designed and lanned by one of their foremost and ablest architects, Mr. ames Miller, and would cover an area, including the art alleries, of about 20 acres. The architectural merit and eauty of the buildings would make them worthy caskets to old the treasures of art, science and industry that would be oured into them from all quarters of the earth. It was as yet oo early to speak of the advantages the 1901 Exhibition would ive, but of one thing he was certain, if what followed in 1888 ollowed in 1901 it would bring in its train increasing prosperity ot only to Glasgow and the West of Scotland, but to the whole ountry.

The Lord Provost (Sir David Richmond) said :—I count it great honour and pleasure to be asked to occupy the principal lace to-day. In thus inaugurating the building operations, I m sure we are all at one in hoping that the structure which vill be reared on this site will prove not only to be an object of race and beauty, but also a source and centre of instruction and ealthy entertainment and pleasure to the people of Scotland nd to visitors from all parts of the world. It is exactly twelve ears since, almost on this spot, a company similar to that which I have now the honour of addressing assembled o witness the cutting of the sod for the foundations of he Exhibition of 1888, and those of us who were present on hat occasion, and who had anything to do with the arrangeents which resulted in the magnificent and successful spectacle which that Exhibition presented cannot but recall the fact with pecial pleasure to-day. Many of the thousands of people who locked through the turnstiles during the summer of 1888 still herish the happiest memories of "The Groveries," and the mpulse which was given to the trade and commerce of Britain y that undertaking is even yet appreciably felt. When preparing for the Exhibition of 1888 we had not, as we have on his occasion, an inspiring precedent on which to base our rrangements. This was a great disadvantage, and, while we ntend to profit by the lessons which the last enterprise taught us, we shall leave no stone unturned in order to eclipse the henomenal success which attended our labours then. We are in the fortunate position not only of having the benefit of he experience of many of the active promoters of the 1888 Exhibition, but also of possessing the palatial pile of the new Art Gallery buildings in which to exhibit the paintings, sculpture work and other art treasures. The members of the various committees are not only in active sympathy with the work which they have on hand, but they possess that administrative ability which is of the utmost importance in the successful and economical adjustment of the hundred-and-one matters of detail connected with the organisation of a great exhibition. It is intended that the Exhibition should, as a collection of the industrial, scientific and art products, not only of the United Kingdom and its colonies, but of the civilised world, be made as complete as possible, and to the attainment of this result every effort will be directed. We have the promise of an important and comprehensive representation of the products and industries of other countries, notably the United States and Belgium, not to mention Canada and other British dominions and colonies. In connection with this matter it is impossible to value too highly the great assistance which was rendered by the Foreign and Scotch Offices in bringing the Exhibition officially under the notice of foreign Governments. We are also considerably indebted to our friends Messrs. Crawford, Simmons & Mason for the good service they did us in enlisting the sympathy of our American cousins. Sir John Muir and his partners are again putting the Exhibition under obligations to them in the matter of securing exhibits from India, so that, all things considered, we are entitled to look forward to an Exhibition which will rank first among similar undertakings in any part of the world. As an exposition of the natural products and manufactures of various countries, it will form an object lesson to our merchants and craftsmen, while the entertainments, sports and other attractions for the pleasure of visitors will be on a lavish and magnificent scale. We are drawing near to the close of the nineteenth century, and it is intended that the forthcoming Exhibition should illustrate as far as possible the wonderful part which this century has played in the history of mankind and the progress of civilisation. In carrying out this object the Clyde Trustees propose to show, by model, the immense change which has been effected on the Clyde as a navigable river. The fine art committee will show us what the nineteenth century has done in the direction of fine art, and the other sections will illustrate the progress which has been made in their own particular departments. The triumphs of the opening century are, likely enough, destined to surpass those of its predecessor, and it will be interesting to have an opportunity of observing what a splendid foundation the past has supplied for the inventors and discoverers of the future to build upon. The design for the buildings now about to be erected is by Mr. James Miller, and they will fittingly house the many beautiful exhibits to be shown in them. The contractors, Messrs. William Shaw & Sons (whom I have to thank most cordially for presenting me with the valuable souvenir of this occasion), were also the contractors for the Exhibition Buildings of 1888, which they erected in a very short space of time and to the entire satisfaction of the building committee, and we wish them a similar success in their present contract. The spot on which we now stand is the site of the central dome of the industrial hall, which building will occupy the whole of the ground contained in this enclosure. The machinery hall will be in the Bunhouse grounds, and these buildings, with the fine art galleries and the corridor connecting the machinery and industrial halls, will contain the various classes and special sections of exhibits.

AN ITALIAN ARCHÆOLOGICAL SCANDAL.

THE Rome correspondent of the *Times* writes :—There are as yet no signs of the report of the Government commission appointed some months ago to inquire into the charges of confusion and wilful inaccuracy currently made in archæological circles against the organisers of the Papa Giulio Museum, and formally brought forward in the preface of the last edition of Professor Helbig's "Führer durch die Sammlungen Klassischer Alterthümer in Rom." It is, indeed, generally doubted whether the report, when drawn up, will be made public. Nevertheless, the most competent archæologists seem already to have acquired a settled conviction that the upshot of the inquiry cannot be sufficiently satisfactory to restore to the museum and its chief organiser, Professor Bernabei, the scientific authority and prestige so seriously shaken by the above-mentioned charges. Some exception has been taken to the composition of the commission, on the ground that Senator Bonasi, the president, has no special qualification for the work, and that the official positions of the two technical commissioners are more or less at the mercy of Professor Bernabei, Director of Fine Arts, into whose conduct it is incidentally their business to inquire. It is objected, furthermore, that the appointment of the Government commission was only announced when the Academia dei Lincei in secret session was about to authorise a more searching investigation. Though these objections are doubtless not entirely without foundation, the high personal character of the members of the Government commission constitutes some guarantee of their impartiality in judging such evidence as they may have thought fit to examine or have been able to obtain. A more serious indictment of the work of the commission might be founded upon its neglect to visit the scene of the excavations at Narce in order to check the accuracy of the topographical and archæological illustrations and maps published under official auspices. The trustworthiness of these documents has

been very seriously impugned and can only be vindicated by a visit to the spot, a visit which the Government commission seems in no hurry to make.

The most valuable collections in the Papa Giulio Museum come, or were reputed to have come, from the groups of Etruscan tombs excavated a few years ago at Civita Castellana and Narce, in the Agro Falisco to the north-east of Lake Bracciano. As arranged in the museum they purported to be exact reproductions of the three categories of Etruscan tombs with their respective contents. From the evidence of the excavators and of the owners of land excavated, it appears, however, that by no means all the objects in the Civita Castellana collection really came from that locality, many of the most valuable finds having been sold to private collectors and their places filled by inferior objects from other places, while the objects really found at Civita Castellana were arranged in the museum in a haphazard and arbitrary fashion by Professor Bernabei and his subordinates. Still worse is said to have been the fate of the objects from the unrivalled Etruscan necropolis at Narce, a site distant some seven kilometres from Civita Castellana. This site was carefully excavated, accurate note being taken of the position and contents of the various tombs in order that their reconstruction in the museum might be effected with precision. The organisers of the museum, however, seem to have arranged the Narce objects so as to make them harmonise with the Civita Castellana jumble; certainly the contents of many tombs were interchanged, and in at least one instance a tomb was introduced into the Narce collection with which the Narce excavators are entirely unacquainted. Worst of all, the excavators' journal, containing precise data concerning the character and proper positions of the Narce objects, has been irrevocably "lost." It was consigned to the authorities at the close of the excavations for preservation in the archives of the Ministry of Public Instruction. Now that the journal is required for the purpose of establishing the accuracy or detecting the inaccuracy of the arrangement of the Narce collection in the museum it is not to be found and is stated to have been destroyed. Its absence, no doubt, prevents the production of documentary evidence of the falsification of the Narce objects in the museum, but it also precludes all possibility of correcting the alleged wilful confusion in the arrangement of the Etruscan relics.

The foregoing conveys roughly an idea of the chief issues involved in the "archæological scandal." The saddest side of the affair for archæologists is that no amount of official whitewashing and no degree of judicious silence on the part of the Government commission can restore to the Papa Giulio Museum its quondam fame as a reliable record of Etruscan civilisation. Whether or no Professor Bernabei continue to direct the Fine Art Department of the Ministry of Public Instruction, it is only too evident that the scientific value of the museum he organised will henceforth be reduced to that of a collection of objects interesting in themselves as relics of antiquity, but deprived of that ordered sequence indispensable for accurate and reliable generalisation.

ST. GEORGE'S TOWER AND SPIRE, LIVERPOOL.

In response to invitations issued by the President and Council of the Liverpool Architectural Society a meeting of members of the Society and representatives of the Historic Society of Lancashire and Cheshire and of the Liverpool Academy of Fine Arts was held last week to consider the intended demolition of St. George's Church, and more particularly the removal of the tower and spire.

Mr. W. E. Willink, president of the Architectural Society, explained the origin and progress of the movement for the removal of St. George's Church, including the recent decision of the city authority to include the demolition of the tower and spire. The members of the Architectural Society considered that in the interests of their art they should get this decision of the City Council reversed. They had also thought it desirable to invite representatives of the Historic Society of Lancashire and Cheshire and of the Academy of Fine Arts to attend the meeting and join them in their efforts to reverse the decision. When they had a good thing in the city it was a great pity they could not keep it. The loss of that building would be one which they would not lightly repair.

Professor Simpson read letters of apology which had been received from those unable to attend the meeting. The Bishop of Liverpool, in the course of his letter, said he thought it very unlikely that it would be a popular step to pull the church down in the manner proposed, especially when nothing better could be put in its place. Mr. R. D. Radcliffe, hon. secretary of the Historic Society of Lancashire and Cheshire, hoped the tower and spire would be preserved, and that a tablet would be placed thereon recording that the altar of the church, of which it was the only remaining portion, stood on the site of the altar of the chapel of Liverpool Castle, the oldest ecclesiastical foundation in the town—at least such was the firm conviction of the late Mr. E. W. Cox. Mr. Morrison, president of the Academy of Fine Arts, wrote wishing all success to the meeting. Mr. Burridge, head master of the School of Art, sympathised with any effort to retain buildings of historical and architectural interest, and therefore approved of the object of the meeting. Mr. Deacon, architect, in his letter said if he were able to be present he would vote for the retention of the tower and spire. Mr. J. Watts, artist, wrote that all landscape painters must deplore the removal of the tower and spire as it was one of the few points of picturesque interest in their poor river front. Professor Simpson said he had much pleasure in moving the first resolution, which was as follows:—"That from æsthetic and historical considerations the demolition of St. George's tower and spire would be an act very greatly to be regretted." He remarked that anything that would tend to injure or destroy in any way the appearance of the town from the river was to be deplored, not only by the inhabitants and those many thousands of people who each day crossed the river, but by the numerous foreigners who came to the port. There were three very strong reasons why this portion of the church should be retained. First of all, it was the site of the old castle; secondly, it was the site of the old church; and thirdly, it would mark the site of the present church. With regard to the design, he considered that it was a marvellously fine one, quite as fine as that of many of the Wren churches. Another point he emphasised was that the tower and spire would be perfectly safe.

Mr. R. Fowler seconded the motion.

The Chairman said a letter had been received from Mr. Woolfall, vice-president of the Architectural Society. The letter was read, and in it Mr. Woolfall expressed himself as favourable to the removal of the building if the Corporation would see that the church, with tower and spire complete, was re-erected in some other prominent position.

The resolution was unanimously carried.

Mr. H. Peet (of the Historic Society) moved the second resolution:—"That the finance committee be respectfully requested to recommend the City Council to rescind their resolution of April 5 with reference to the demolition of St. George's tower and spire." He had very little to add to what had already appeared in the newspapers on the subject under his signature. There were, however, one or two things he thought he ought to mention. He thought the City Council had to some extent been misled. He was told that in the speech Sir Thomas Hughes made to the City Council, he said the expense of taking down the tower would be enormous. The contractor had offered (said Mr. Peet) a substantial sum for the tower and spire as it stood. He believed if the church were taken away and the tower left standing, and if the tower were afterwards taken away it would not be a question of 100*l.* one way or the other; the probability was it would be 100*l.* to the advantage of the Corporation. It was nearly in the middle of Derby Square, and was clearly seen from three important thoroughfares—South Castle Street, Fenwick Street and Lord Street.

Mr. H. Hartley, in seconding the motion, said an eminent expert had satisfied himself that the tower was substantially built and would be absolutely safe after the body of the church had been removed. The City Council, too, were apparently ignorant of the fact that Mr. Goldstraw, their building surveyor, after making a careful examination, found the base and the whole of the tower so strong, he had no hesitation in saying that it could stand when the body of the church had been removed. Had the Council known these facts he thought they would have voted differently on the subject.

Mr. M'Govern spoke in support of the resolution, which was unanimously carried.

TESSERÆ.

Haydon on the Academy Dinner.

Of all human farces enacted, commend me to the Academy dinner. It is unquestionably the most brilliant imposture in Europe. I have witnessed this "comédie" for forty years—the same speeches, the same healths, the same anticipation of great things, the same perpetuation of small ones, the same row of tip-toes, the same lords and ladies and chancellors, the same wigs, the same clouds, the same bits of column and curtain and red coat, the same silks, the same satins, the same doing the amiable, the same doing the intellectual, the same doing the sentimental, the same doing the dandy and the beauty—the member and the mayor, the peer and prince—the same discussions during claret on the tone of Lady Mary's bonnet and Lady Charlotte's cheek, the same heat, the same gossip, the same "Non Nobis," &c., the same "Hail, Star," &c., the same wine, the same ennui; when up they all get full of loyalty and fine arts, the ministers to their cliques, the members to their clubs, the artists to their indigestion and blue pill, those

who have no centres cursing those who have, and retiring to sleep, if they can, with vengeance in their livers, believing they have advanced high art. Tell me a vaudeville equal to this—tell me a Molière who can exceed it—tell me a delusion of Bedlam that can beat it. Would I abolish it? certainly not; abolish the Academy dinner and the next shooting season the artist would be shown to the housekeeper's table. Would I destroy the Academy? Not I; though it is a slavish organ of the vanities of fashion, it is a bulwark against its insolence. Reform it, my respectable friends, cleanse it, sweep it, preserve it, scrape it, whitewash it, remodel and reconsider its laws, fit them for the time, new fashion its constitution, double the paltry salary of its officers, unite it with the people and raise its importance, and the art will be saved and the Academy too. It is at present, with all its faults, a beautiful charity for the afflicted, and perfection itself in providing objects for the use of its funds. Its charity will always be in request whilst its despotism is never controlled, and if Europe should wish to know the secret of providing the lazar house with patients, they have only to consult the hanging committee.

The Salisbury Chapter-House.

There is no record of exact period when the interesting chapter house at Salisbury was erected. It is supposed to have been commenced a few years after the completion of the cathedral in 1258, and its design is attributed to Bishop Bridport, who died in 1262. Price in his history, published in 1753, merely affirms "that by several diligent searches into and careful inspections upon the nature of the work, I find that the cloisters, chapter house and monument room, were not begun till the cathedral was considerably advanced, because the stonework is not bonded together, as it must have been had all been carried on together, though manifestly by the same architect." But by whomsover built, it must have been in its original state, "with its central clustered columns, its vaulted roof and ramified ribs, its light, large and lofty windows, all decorated with stained glass, its sculpture and a floor paved with richly glazed tiles," perhaps the most beautiful room of its class in Europe; or as Gilpin says, "nothing in architecture being more pleasing." The only paper or notice relating to it amongst the cathedral records is the following quaint report made in 1691 by Thomas Naish, clerk of the works to the fabric, with an estimate of the charge of bringing it into good repair. "And first to begin with what threatens the suddenest ruin. The chapter house is an octagon of 68 feet diameter built with too slight abutments to support the thrust of the vaulting, the least space of time (the weight of the former being too little for the thrust of the latter) were not the springers of the vaulting braced together with eight bars of iron united at the centre, and fixed in hooks at each angle, which hooks are gutted with lead to fix them to the wall; but by the thrust of the arching several of these hooks are drawn out of their first place, some 6 inches, some more, some less; by which means the vault is spread and hath rent the walls in several places 3 inches or 4 inches wide, and drawn the columns which standeth in the middle (being not more than 16 inches diameter) about 6 inches from its perpendicular, and by a small declension further, must in all likelihood fall to the ground. The roof is also decayed, and thrusts the walls outwards and helps towards its ruin. Some of the buttresses are decayed at foot, the stones being loose or scaled by frost. Part of the walls between the vaulting and roof is by some former wet (qy. rent?) so shattered that it scarce well supports the roof. The mullions of windows also are scaled by the rusting of the iron bars that are fixed in them, and some of the tracery work like to drop by the spreading of the walls. The cure proposed is a brace of iron round each buttress, fixed to the bars which now are in the crooks, which need be 3 inches broad and 1 inch thick, and will weigh the whole eight, 2,160 lb. at 6*d.* per lb. amounts to 54*l.* An iron band quite round the chapter house on the top of the windows, of the same dimensions, will weigh 2,500 lbs. at 6*d.* per lb. = 62*l.* 10*s.* Repairing the defective part of the timber work of roof, 40*l.* Repairing the walls between the vaulting and roof, new footing the butments where decayed. Restoring the mullions that are scaled and broken, and new pointing and keying of the walls and vaulting where rent, and all mason's work, 90*l.* Total, 246*l.* 10*s.*"

English Academies.

Nothing could exceed the apathy of the English nation, touching the affairs of the fine arts, from the period of the death of Charles I to the middle of last century. Sir Godfrey Kneller had suggested the advantages that would be likely to result from a national establishment for the promotion of the arts, but it availed not. This foreign artist, however, may be said to have mainly contributed to the advancement of so desirable an object, for he promoted meetings among the artists, who resolved upon establishing an academy at their own expense, which being formed, it was held in his house, in Great Queen Street, Lincoln's Inn Fields, and they placed him at their head. This was founded in the year 1711, and there the indefatigable George Vertue studied the human figure. Sir James Thornhill had long been zealous in his endeavours to promote a similar institution for the cultivation of the fine arts, and had drawn out a plan for a royal academy, with an estimate for the building, with apartments for the professors, and suggested the site for its erection, namely, the upper end of the King's Mews, Charing Cross. This estimate he delivered to Lord Halifax, who, it appears, was inclined to promote the plan, but although the sum required amounted to little more than 3,000*l.*, the scheme failed. Sir Godfrey Kneller died in 1723, when it appears a schism arose among the members of his academy, so that in 1724 they separated; one party seceding with Vanderbank and establishing a separate academy in a building that had been used for a sectarian meeting, the other party following Sir James Thornhill, who built a large room behind his house, near Covent Garden Theatre, and procured a collection of casts from the antique, opened it as an academy, which continued until his death in 1734. Vanderbank's institution was of but short duration. On the death of Sir James Thornhill this academy was discontinued, and the members separated. But another society was soon established, principally by foreigners, who held their meetings in the house of a Mr. Hyde, a painter residing in Greyhound Court, Arundel Street, Strand. They procured living models to study from, and appointed Moser to the office of principal conductor. These pursuing their study with success, under so able a president, made others desirous of joining their friendly community, whence, their numbers increasing, they removed to St. Martin's Lane, and founded that academy so celebrated for the ingenious painters, sculptors, engravers and others who ultimately enrolled themselves in the list of its members. On the demise of Sir James Thornhill the casts from the antique, some of which were very fine, that had been used in his academy devolved to Hogarth, who had married the only daughter of Sir James. These Hogarth generously lent to the society in St. Martin's Lane, of which he had become a member, and which was the precursor of the Royal Academy

St. Mary Redcliffe, Bristol.

There are four palpable varieties of Gothic architecture in Redcliffe Church, manifesting as many architects and as many different times when they were respectively designed and erected. The inner north porch or vestibule—the tower and spire—the outer north porch—the body of the church, with the lady chapel and the south porch—were built successively, and it is generally admitted that an older church was removed to give place to the present nave and chancel, with their aisles and the transept. The oldest of these members, *i.e.* the vestibule, is of a date between A.D. 1200 and 1230. "In 1207 Lord Robert de Berkeley granted to Redcliffe Church, at the request of William, the chaplain, his fountain of water from Huge well for the friars of St. John the Baptist in Redcliffe." Lands were conferred on the same church about that time, plainly showing that there was one then in the parish. The tower and spire we may safely refer to the reign of Edward I., as corresponding with known specimens of that age. According to the chronicles of Bristol, Simon de Bourton, who was mayor in 1293, "began to build the church of St. Mary de Redcliffe when John Lamyngton was chaplain." Seyer, in his "Memoirs of Bristol" from MS. Calendar, more cautious and particular, says, "It was about the year 1293 or 1294 that Simon de Bourton, a person of wealth and consequence, who was mayor of Bristol in that year, and bore the same office six times, built the church of St. Mary, Redcliffe, where the eastern end now is." Here we find it positively stated by one writer that the church was built, and by another that it was begun, at the above date; but no part of the present church is so early as 1294.

The First London Opera House.

It was not until the beginning of the last century that Italian music had obtained so high an estimation in England as to receive decided encouragement, and even then it was inadequate to the means of providing for its support on a scale at all worthy of the country, for although its merits were acknowledged by a few, yet the science of music was not at that time sufficiently understood by the public to ensure its patronage; and after the experiment made by erecting this theatre and introducing Italian singers, at the suggestion and by the influence of Sir John Vanbrugh, the architect, who zealously employed his interest and fortune towards the advancement of the opera, it was in a few years found necessary to support the already embarrassed project by a large subscription, and which eventually received the royal patronage and that of the chief nobility. The first opera house in England was built on the site of Her Majesty's Theatre by Sir John Vanbrugh in 1704, and opened to the public in the April of the following year, and then called the Queen's Theatre. Musical pieces in English, with the occasional introduction of some Italian singers, and the regular drama became the usual entertainments; and in this way, chiefly under the management

of Sir John and Congreve the speculation proceeded heavily, and with precarious success, and it was not until the year 1720 that the opera assumed the promise of form and stability, at which time His Majesty George I. countenanced the subscription of 50,000*l.* by a liberal contribution, and which cheering example was followed by the Court. As the science of music became better understood it was the more admired, and proportionately encouraged, and as the jealousies and opposition made by conflicting interests subsided the Italian opera became established in England, and the edifice itself profited by its success. From this time the theatre submitted to various and repeated changes, under the direction of its architects, as improved knowledge or the preponderance of fashion made it needful or politic to venture upon them, until the whole was rearranged by Robert Adam the architect. The changes were not, however, the most judicious, and the house again underwent considerable alteration by Novosielski, whose qualifications were considered to be ample, from his intimate acquaintance with the economy of the stage. In the year 1789 the edifice was accidentally burnt to the ground, and in the following year the foundations were laid for a new building, from designs also by Novosielski, who, taking advantage of the space now cleared for his exertions, increased the area of the house, which heretofore had been too narrow and incommodious, and adopted for its internal shape the horseshoe form, at that time a novelty in British theatres, but practised by the Italians in their edifices.

Topographical Plans.

Ruskin, in his work on "Modern Painters," says, what the map-draughtsman may take as addressed to him, to direct his study of natural form in ideal perception:—"The task of the painter in the pursuit of ideal form is to obtain accurate knowledge of the peculiar characters of every species of being, down even to the stone, for there is an ideality of granite, and slate and marble. A bank of loose earth of any kind that has been at all exposed to the weather contains in it features capable of giving high gratification to a careful observer. It is almost a facsimile of a mountain slope of soft decomposing rock; it possesses nearly the same varieties of character." "There is an expression about all hill lines of nature, but it is not to be reduced to line and rule." "Turner's early drawings are singularly instructive in definiteness and simplicity of aim; they are little more than exquisite studies in light and shade." This should surely be the draughtsman's aim in expressing the forms of land in a map. "All forceful shadow and play of colour surrendered for quiet uniform hues of grey and chiaroscuro of extreme simplicity, proper for architectural drawings in relievo." This is exactly what should be said for the shading plans of ground in relievo. The term "form" is not to be applied to the outline of bodies. "It necessarily implies light and shade; no form whatever can be known to the eye without its chiaro-scuro, that perfect and harmonious unity of outline with light and shade by which the parts and projections of the body are explained to the eye." "The eye of knowledge is as a telescope to the common eye, by which more is apprehended than is immediately seen." Thus forms of land are seen in their origin, composition, &c., to the cultivated eye. "Truths of specific form are the first and most important of all." Under such guidance as this the map-draughtsman may both please the eye with pictural expression in grace and elegance, and the mind, which must be his chief object after all, with the information and description it requires. The subject may not be always beautiful in itself, but in reference to circumstances and associations with what is interesting and important in the knowledge of ground it may call for artistic description in a map to convey it at least agreeably and satisfactorily to the eye, and what is beautiful in a richly varied face of country may be beautifully portrayed.

Expression in Architecture.

The importance of the architect's well considering the style and expression of his building is manifest, since he is bound by the laws and spirit of his art to aim at originality. We all feel that buildings possessing a suitable expression never fail to arrest attention and inspire interest, but when they are shorn of this essential and soul-stirring attraction they are passed by as piles of hard materials and nothing else, as a dead letter, not a language. It is to be observed that the capitals of the three orders of architecture, owing to the conspicuous part they play in a building, and their being so susceptible of modified expression, with strict attention to the preservation of their original form and meaning, are admirably calculated both to receive and reflect a full impression of the character which it is sought to display; the same thing holds good in detail generally. If this be borne in mind in designing, novelty will occur as often as the destination of the building varies—and this circumstance should act as a warning to those persons who, thinking but casually upon art, are apt to taunt architects with the slavish disposition of copying the ancients, because they make use of similar elements. In the way those persons mean, the ancients were copyists also, for they the ancient repeatedly imitated themselves. When at last the elements o Classical architecture became defined, they were adopted as th elements of the art and adhered to, and to adorn them wit new and ever varying sentiment became the study of the mos imaginative amongst the ancients. Thus there are no bound to the power of invention, save those which reason alon imposes—there is absolutely no such thing as being compelle to copy; all nature tells us so. Marvellous as the economy nature is in adhering to forms created from the beginning, sti she is continually presenting us with novelty in the varie expression of those very forms. Thus as regards the huma countenance, though one and all of the millions created ar based upon the same foundation, what variety does it no present? We know the formation and construction of th features of the human countenance to have been the same fro the creation of man to the present time; the infinite variet which it exhibits depending entirely upon expression, and wh would wish for greater novelty? In this wondrous restrain which all powerful nature imposes upon herself—in this marke economy of invention it is that we see revealed much of th awful wisdom which pervades all her works.

English Oak.

The difference between the woods of the two oaks commonl seen in England is, that the grain of the wood of *quercu sessiliflora* is generally less varied and of a more uniform an deeper colour than that of *quercus pedunculata*, and with les of that laminated appearance which is called the flash, o silver grain. The trees are said to be known by the *sessiliflor* having the acorn stalks short or seated, with the leaves long while the *pedunculata* is the reverse, having the acorn stalk long and the leaves short. The acorns of the former grow i clusters of two or three close to the stem of the branch, those of the latter grow singly, or seldom two on the same footstalk The *quercus pedunculata*, or robur as it is more generally called is the true old English oak, the *sessiliflora* being supposed t have been introduced some two or three ages ago from th Continent. There appears to be much diversity of opinio among botanists and planters on the value of the timbers o these two oaks, to the same extent at least as that alread shown to have existed on the use of chestnut, and some author deny the botanical difference of the trees.

GENERAL.

The Most Worshipful Grand Master H.R.H. th Prince of Wales has been pleased to reappoint Mr. Henry L. Florence, vice-president, R.I.B.A., the present Grand Superintendent of Works, to that office in Grand Lodge fo the ensuing year.

Sir Robert Ball unveiled on Saturday a bronze table placed on 19 New King Street, Bath, recording the fact tha Sir William Herschel, the great astronomer, resided there Bath abounds in historic houses, and the Corporation recentl decided to place tablets upon a number of those formerly occu pied by persons whose claims to remembrance are world-wide Herschel discovered the planet Uranus in the back garden o that house, and on occasion he used to bring his telescope ou into the street opposite, where many of his discoveries were made.

Paris Bordone's *Baptism of Christ*, in which are seen St. John, from the bank, pouring water from a vessel over Ou Lord, an angel to the left and a group of cherubs in the sky formerly in the Palazzo Ambrosia Doria, and exhibited a Burlington House, 1877, was sold on Saturday for 1,07 guineas.

Tamworth Castle is to be formally opened to the publi on Whit Monday.

The Venice Art Exhibition was opened on Monda morning in the presence of the Duke of Genoa, Signo Baccelli, Minister of Public Instruction, the principal civil an military authorities, and a large concourse of spectators.

A Lecture will be given by Mr. Stephen Webb, entitle "Design for Relief Decoration," to the Society of Designer on Tuesday evening, May 9, at 8 o'clock P.M.

The Royal Society of Painters in Water-Colours at a general meeting on Tuesday elected Mr. J. M. Swan, A.R.A and Mr. Robert Little full members of the Society.

The Roman Remains at Darenth having ceased to be a wonder, the occupier of the soil has decided to re-cover th ruins and again devote the land to agriculture.

The Improvements Committee of the Leeds Corporation decided on Wednesday to construct a new street 45 feet wid from Albion Place to Briggate.

The London, Brighton & South Coast Railway Company have resolved to carry out improvements at the Victoria terminus which will cost 2,000,000*l.*

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to rise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

TRADE NOTES.

A LARGE clock has just been erected in the parish church at Peasonhall, Suffolk, which strikes the hours and shows the time on a dial 5 feet across. The work has been carried out by Messrs. John Smith & Sons, Midland Clock Works, Derby.

MESSRS. HAYWARD & SONS have on view at their rooms in Regent Street an extensive array of wall decoration in silk, canvas and paper; the designs are for the most part bold and striking, and some very fine effects are noticeable in the hand work, which may be regarded as a specialty of the firm. Another specialty is their patent invisible joint, which by following to some extent the intricacies and sinuosities of the pattern, avoids the objectionable straight joining.

NEW CATALOGUE.

THE catalogue which has been prepared by the Simplex Steel Conduit Company, Limited, of Coventry Street, Birmingham, contains an admirably lucid description of the excellent system of electric wiring which is the business of the company, illustrated by well-drawn and clearly-printed diagrams in illustration, and sketches of the various appliances and fittings requisite to it and their price. In it will also be found a considerable variety of useful information and serviceable hints on the subjects of electricity and electric lighting.

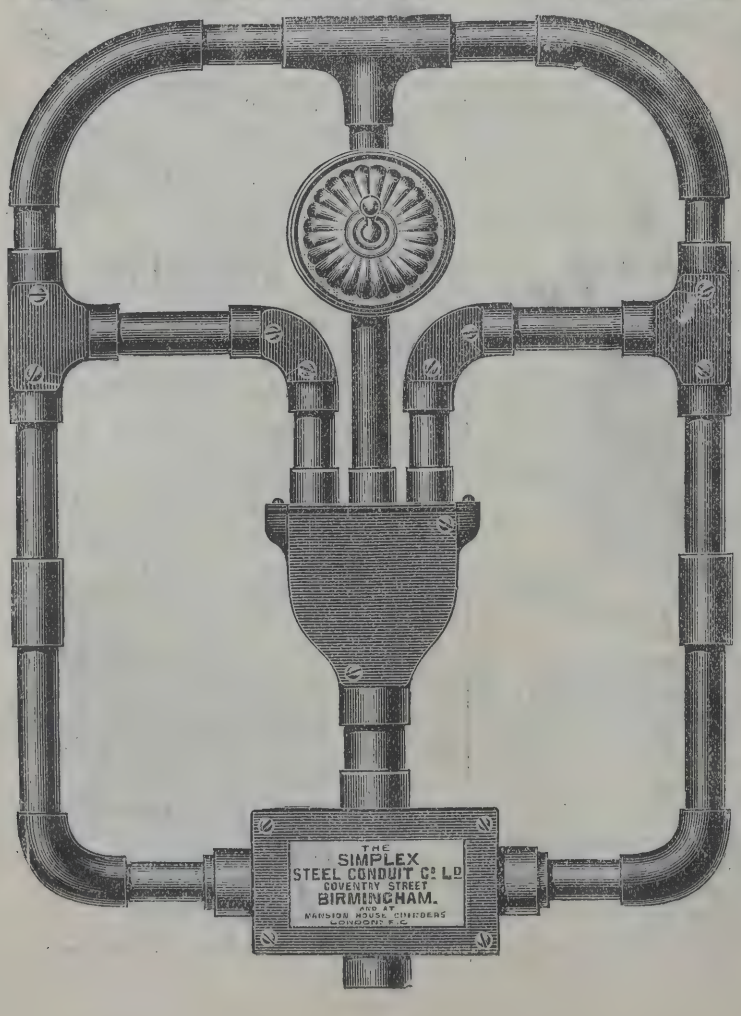
BUILDING AND BUILDERS.

IT has been decided to build a Welsh Calvinistic Methodist chapel in Holt Road, Liverpool.

THREE detached villa blocks are to be added to the County Lunatic Asylum, Morpeth.

A SITE has been purchased at Blackheath, near Rowley Regis, for the new Congregational church and Sunday schools.

THE contractors for the new pavilion at the Oval for the Surrey County Cricket Club have already received 33,558*l.*, and the account is not yet settled.



THE foundation-stone was laid on the 19th inst. of an extensive block of buildings which are in course of erection on Snow Hill, and which are designed for use as cold stores in connection with the Smithfield Markets.

THE contractors for the restoration of Peterborough Cathedral have been authorised to proceed with further works at a cost of 964*l.*, chiefly in connection with the pinnacles of the south-west tower.

THE Education Department have sent two epistles to Colne School Board. One authorised them to build a new school. The other intimated that they could not be allowed to suspend building operations for the remainder of their existence as a Board, the Board practically being in default.

THE building trade dispute at West Hartlepool led to a serious outrage there on Monday. A builder's labourer, named Jordan, working on a house in Duke Street in course of erection, was followed by two other labourers, with whom he had some words. They seized him and, it is alleged, threw him to the ground, a distance of two storeys. The man's leg was badly broken, and he sustained other serious injuries. His assailants are in custody.

A remarkable instance of rapid building erection was accomplished recently in constructing the Vincent Building at the corner of Duane Street and Broadway in New York, a fifteen-storey structure on a 110 by 51-foot lot. The building was erected from foundation to roof and the exterior walls finished in four months. The architect is Mr. George B. Post.

The journeymen plumbers and builders' labourers in Wolverhampton threaten to come out on strike on May 1, owing to the refusal of the employers to grant their demand for an advance of ½*d.* per hour wages. The labourers ask for an increase of from 5½*d.* to 6*d.*, and the working plumbers from 8½*d.* to 9*d.*

The plans for converting the Pavilion, facing the Harris Promenade, into a theatre have been passed by the committee of the Douglas Town Council which has charge of such matters. Mr. Frank Matcham, the architect, states that the Pavilion will have a holding capacity larger than the Grand Theatre to the extent of about 300 persons.

A communication has been received from the Board of Trade approving of the plans for the extension of Stonehaven Harbour, N.B. At a meeting of the Harbour Commissioners, Provost Mowat presiding, a letter was submitted from the Public Works Loan Commissioners, in which they declined to reduce the interest on the proposed loan for the construction of the works, the cost of the extension being 11,000*l.* It was decided to ask the Loan Commissioners to forego charging interest during the construction of the works.

VARIETIES.

The Alexandra College, Dublin, is to be enlarged, and a sum of 3,239*l.* towards expenses has been subscribed.

A branch bank is to be erected in Collingwood Street, Newcastle-on-Tyne, for Messrs. Barclay & Co.

An appeal has been issued for aid towards the expenses of proposed structural improvements in the Royal Free Hospital, Gray's Inn Road, which are estimated to cost 8,500*l.*

The judge at the Shoreditch County Court has held that a plumber's workshop is not a "factory" within the meaning of the Workmen's Compensation Act.

The Edinburgh Corporation, having introduced a clause in a Bill giving their officers control of all advertisement stations, the committee have amended it in order to allow of an appeal to the sheriff in case of unreasonable interference.

The Belgian Government has agreed to the holding of a Universal Exhibition at Liège in the year 1903, and it is determined that it shall be of an industrial character.

The Glasgow joiners having struck for a rise of one half-penny advance in wages, before the first day passed a meeting was held in the Builders' Exchange, and the employers granted the increase. The rate is now in the district 10*d.* an hour.

The artisans' dwellings committee of the Coventry City Council have resolved, it is stated, to recommend the erection of a block of tenement property. Two-storeyed flats are suggested on the principle of a rental of 1*s.* per week per room.

The London County Council have approved by a majority of forty the recommendation to construct another tunnel under the Thames to connect Rotherhithe and Shadwell at a cost of 2,198,250*l.*

At the last meeting of the Cranbrook Rural District Council the plans for the sewerage and sewage disposal for the district of Hawkhurst, prepared by Messrs. Sands & Walker, civil engineers, Nottingham, were approved, and application is to be made to the Local Government Board for sanction to the necessary loan for carrying out the works.

The foundation-stone of a new Catholic school-church was laid on the 22nd inst. at Accrington. The land cost 1,500*l.*, and the school-church will entail an outlay of 5,270*l.* more. It will ultimately provide accommodation for 670 children. Later on a church will be erected, together with a presbytery. The whole of the present building will then be utilised as a school. Mr. Hill, of Manchester, is the architect.

Mr. A. A. Hudson, barrister, has given his award in the dispute at Wigan. The carpenters and joiners had asked for an advance of 1*d.* per hour and a reduction in hours from 53 to 49½. The award gives the men an advance of ½*d.* per hour, but no reduction in hours. This will bring the wages up to 2*l.* 0*s.* 10*d.* from 1*l.* 18*s.* 7*d.* The men have also maintained the old conditions with reference to the grinding of tools when being dismissed. It is understood the award does not come into operation until September 1.

The following resolution is to be moved at the meeting of the Birmingham School Board:—"That, in view of the inconvenience caused by prolonged industrial conflicts, it is expedient that the contracts entered into by the Board should be given,

as far as possible, only to such firms as will undertake to submit all labour disputes to the conciliation tribunal now provided by statute ; and that the sites and building committee be instructed to consider and report as to the best means of obtaining that object."

A MEETING of the parks committee of Newcastle Corporation was held on Monday, when arrangements were made to carry out the wishes of Lord Armstrong by taking over Jesmond Dene from the May term. It was also settled that the next meeting of the committee should be held in the banqueting hall, when they will formally take possession of the new inheritance on behalf of the city.

THE assessors' report has been issued on the competitive plans of a new higher grade school proposed to be built by the Burnley School Board, at an estimated cost of 12,000*l.* The first prize of 50*l.* was awarded to Mr. Quarmby, of Burnley; the second of 20*l.* to Mr. F. W. Dixon, Corporation Street, Manchester ; while the third, of 10*l.*, was divided between Messrs. T. Bell, of Burnley, R. Holt, of Southport, and J. M. Bottomley, Bond Street, Leeds. The assessors were Messrs. Oliver & Leeson, of Newcastle.

MR. ROGERS, factory inspector, has prosecuted a working sawyer in Manchester for neglecting to maintain the guard of a circular saw at the works of his employers, Messrs. Bennett, Hyde Road. The firm had provided saw-guards after an accident, by which a boy was decapitated, but the defendant was found at work without a guard, and the prosecution was, Mr. Rogers stated, the first of the kind which he had ever taken against workmen. It was necessary, however, to warn them of their liability for neglect of safeguards provided by employers. The defendant expressed regret, and the mitigated penalty of 5*s.* and costs was imposed. An engineer employed by another firm was fined 40*s.* and costs for neglecting to maintain the fencing of a gas engine.

THE accounts of the Manchester Corporation Waterworks Department for the year ended March 31 show that the gross income for the twelve months was 312,041*l.* ; the expenditure, including interest on waterworks debt, sinking fund and maintenance of works was 283,461*l*, leaving a balance of 28,629*l.* to be carried forward. The committee are in a position to make a reduction in the public and domestic water rates. The public rate this year will be 1*d.* in the pound, against 3*d.* last year, and the domestic water rate 8*d.*, against 9*d.* A discount of 5 per cent. will also be allowed off all accounts for supplies of water by meter amounting to 10*s.* per quarter and upwards, provided that the accounts are paid within a specified time. These remissions in the water charge amount to 35,000*l.*

MEASURES BROTHERS & CO., Limited, the well-known iron and steel merchants, will be offered to the public in the course of a few days. The share capital will consist of 285,000*l.*, divided into 75,000 Five-and-a-Half per Cent. Preference shares of 1*l.* each and 210,000 Ordinary shares of 1*l.* each; and 75,000*l.* Four-and-a-Half per Cent. First Mortgage Debenture stock. The profits, it is understood, are enough to pay 10 per cent. on the Ordinary shares after all expenses are paid. The business consists largely in the manufacture and sale of iron girders, joists, roofs, bridges, tanks, rails and similar articles, for which the firm has obtained a world-wide reputation, the customers on the books numbering between 6,000 and 7,000, including the British and foreign Governments, H.M. Admiralty, the War Office, Post Office, Crown Agents for the Colonies, railway companies, and contractors and builders in a large way of business.

THE Home and Shelter for Women which has been erected in Great Ancoats Street, Manchester, was opened on the 21st inst. The building, which is connected with the Manchester and Salford Wesleyan Mission, is erected on a plot of land with a frontage of 90 feet to George Leigh Street and 20 feet to Great Ancoats Street. It is four storeys high, and is divided into three separate departments, namely, for casuals, servants' home and temporary home. There is also a coffee tavern and dining-room, which will be worked by the girls of the temporary home. There are sixty-three adequately furnished cubicles, giving accommodation to the various departments Each department will have its own bathroom and lavatory; dayrooms, kitchen and laundry are also provided. There is special accommodation for the matron, and every attention has been given to make the home bright, cheerful and attractive. A separate entrance is provided to each department. The whole of the buildings are lighted by electricity. In the design for the exterior the object of the architect has been to give a purely domestic character to the building, and as far as possible to suggest brighter and more cheerful scenes than are to be found in the neighbourhood of Ancoats. In connection with the mission the foundation-stone of a men's home was laid in November last in Hood Street, Ancoats, by the Lord Mayor of Manchester. The cost of the two institutions is estimated at about 14,000*l.* or 15,000*l.*

THE PLEIADES OF PROGRESS.

CATHEDRAL SERIES.—DURHAM: FROM LANDING STAGE.

SHIPLAKE COURT, HENLEY-ON-THAMES.

MANSION, QUEEN'S GATE, W.

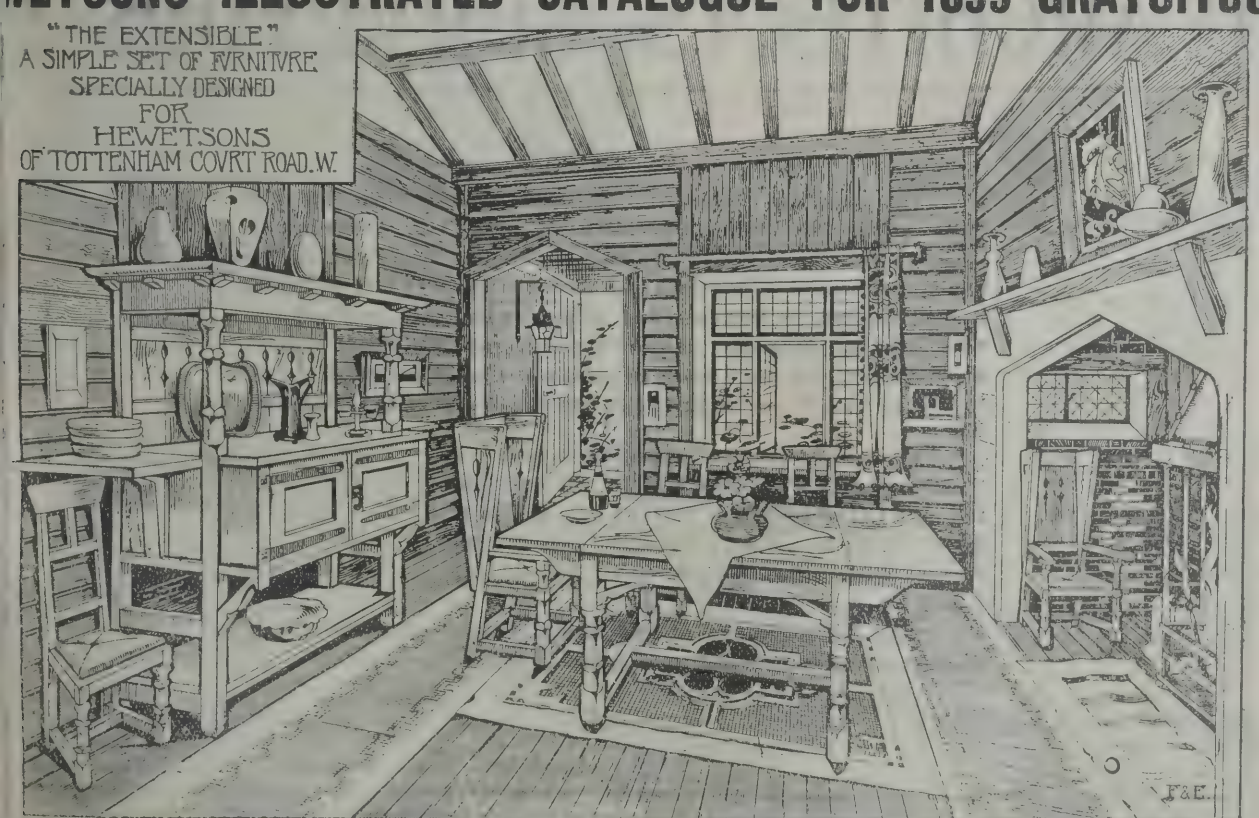
MR. C. DUNDAS SLATER may be congratulated on having ade another hit in the new ballet which he put on at the ambra on Monday evening. Of kaleidoscopic brightness l variety and with abundance of tuneful music, it was wel-ned by a large audience with enthusiastic applause. It is a le out of the ordinary run of the ballets to which we are ustomed, as the motives which animate the different *dramatis sonæ* are explained by dialogue instead of gesture, and the t, which is of the simplest, shows how an estate agent, his e, son and office boy, all start unbeknown to each other for Day Off" on board *La Marguerite*, and the complica-ns their various flirtations give rise to. Misses Casaboni, ie Seale, Mdlle. D'Alençon, and Messrs. Lytton Grey, Fred rren, Charles Raymond and the Alombi Brothers all did od service, which was thoroughly appreciated.

ELECTRIC NOTES.

E electric lighting committee of Edinburgh Town ncil have resolved to recommend that the Council make no nge on the charge for electric energy for the year from y 15, 1899, to May 15, 1900.

ARRANGEMENTS have been made to connect the electric allation in the house of the Society of Arts with the street ins, and therefore the machinery and apparatus used since electric light was first installed in the Society's house in 3 are now no longer required. It is proposed to offer m in the first instance at a moderate cost to any member of Society who may be contemplating an electric installation he country.

THE BUILDING TRADES EXHIBITION.



As we foreshadowed in our last issue, the exhibition which was inaugurated on Wednesday last by Professor Aitchison, President, R.I.B.A., beats previous records. At no time in the past have the prominent firms dealing in building materials and wares been so worthily represented, nor, it may be said, *en passant*, has the taste displayed in the arrangement of the various exhibits ever been so satisfactorily employed. It is comparatively easy to arrange an effective exhibit of decorative materials, no doubt, although even in *their* arrangement a correct eye and a deft touch can effect wonders, but to arrange attractively a pyramid of drain-pipes and chimney-pots is "another story," and it is not too much to say that the care evinced in arrangement of the majority of the exhibits reflects credit on everyone concerned.

The opening ceremony, which took place in the gallery, suffered considerably from an oratorical point of view from the din and clatter which, in spite of Mr. Montgomery's requests and admonitions, exhibitors who were late in arranging their stands created in their endeavour to make up for lost time, entirely drowning the speakers' voices, with the inevitable result that Professor Aitchison's remarks were for the most part inaudible. From what could be caught, however, the Professor was understood to refer to the increase in wages during the past fifty years, which he welcomed because it stimulated both production and consumption. But he pointed out a danger which arose from this dearness of labour, and that was the increase of mechanical production, and consequently the production of rubbish. He protested against the insane desire for cheapness above everything else, and appealed for more artistic work in building, coupled with good and enduring workmanship. Mr. J. W. Swann, the president of the Institution of Electrical Engineers, proposed a vote of thanks to Professor Aitchison, who added a few words in acknowledgment.

Mural Decorations Company.

The exhibit arranged by the Mural Decorations Company will be sure to attract attention owing to its prominent position and skilful arrangement. It shows a kind of domed pavilion left purposely incompleted to exemplify the method of construction with the company's terra-cotta lathing, which is in part left exposed, the greater portion, however, being finished with the fibrous-plaster mural decoration from which the company derives its name. A charming enriched cornice is shown with

EWETSONS, TOTTENHAM COURT ROAD, LONDON, W.

flowers in high relief, arranged for electric lighting; and some highly effective panels in basso-relievo decorated in colour also command attention.

Doulton & Co., Limited.

A portion of this stand is allotted to the display of a collection of mantelpieces and fireplaces in glazed faïence. We notice in the designs a successful attempt to depart from the more or less stereotyped fashions that have hitherto ruled in this department of ceramics. The forms are commendably simple, and the colour effects quiet and restful. In the specimens of wall tiling the same desire for simplicity of arrangement and artistic balance of colour is evident. The absence of a high gloss is the distinguishing characteristic of the "Carrara" stoneware, and this will recommend the material to those who dislike the effect of too glittering a surface. In the section for sanitary fittings are strong glazed ware sinks for hospital use. These are arranged so that the bed-pans can be thoroughly cleaned without being handled in any way. This is done by means of a spray and jet, and the valves for these are worked by means of treadle action. The sink, in addition, has a flushing rim, so that the whole surface can be cleaned after using. The baths are varied in pattern and design, canopy, French and sitz forms being among those exhibited. There is one bath which calls for special attention, which is on the same principle as the canopy arrangement, having shower, spray, &c., but instead of the large hood at the back it is merely a skeleton arrangement with a hanging curtain.

Amongst the lavatories are some very highly finished examples with marble tops, friezes, &c., and specially shaped basins. In all cases where fitted with standing waste and vulcanite plug, the outlet is made as large as possible, so as to allow of their emptying quickly. For supporting the tops either ornamental brackets or highly-finished standards are used, so that the whole space beneath shall be quite open. Closets are shown fitted as for use. One which is specially noticeable is the syphonic, which gives a good water area and depth of seal, and possesses great advantages in its simplicity and strength of action. The "Paisley" cistern is fixed with these closets, but in some cases the shell, instead of being made in cast-iron as usual, is made in highly-decorated pottery. Doulton & Company's exhibit includes their well-known stoneware pipes of the ordinary type, and with their "self-adjusting" and "composite" joints, both of which forms have been extensively used for main sewer schemes, and for the drainage of hospitals, public buildi &c. The display of white enamelled fireclay is particul noticeable, and includes lavatories, sinks, &c., all of which samples of excellent manufacture and careful design. Staff shire earthenware, white and cane glazed, is represented selection of closets, urinals, &c., while the Staffordshire bricks also visible on the stand afford further evidence of wide range of Doulton's productions in all classes of cerami

Edwin Palmer.

Mr. Palmer, who is located nearly opposite the U Street entrance (stand 14, row A), shows his patent travel cradle for obviating the use of long ladders and scaffoldin outside painting or repairs. It is a very simple and service contrivance, of which builders and decorators are rapidly covering the usefulness. It can be fixed wherever cradle w is practicable, and by reason of its extreme lightness, e working and capabilities of adjustment it can be used innumerable cases where it would be quite impossible to ordinary boats or ladders.

W. G. & L. England.

Patent sliding and reversible sash-windows are shown by firm. These sashes are made to slide up and down in ordi fashion, but are so constructed that all the fittings are in v and by the removal of two screws the sashes may be insta detached from the frame and reglazed, or new cords attac without disfiguring the paint or disturbing any of the beads.

Aspinall's Enamel, Limited.

This firm, whose name is "familiar in our mouths as hou hold words," occupies its usual central position, the pavi being made conspicuously bright and attractive by means Wapicti and enamel, both of which we have many times occasion to speak favourably of. The Wapicti, as we have t said, is equally suitable for inside or outside work; and regards the latter, we may mention that the company recently brought out a new enamel especially prepared outside work. This will be found even cheaper, more dura and more easy to work than that on which the comp founded its reputation.

TO ARCHITECTS, SURVEYORS, &

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S Patent Mica Valve Chimney Breast Ventilator,
CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM

The Anaglypta Company, Limited.

This company is exhibiting a large and varied selection of ir newest and best productions in extra high, medium and reliefs, together with a few choice and special decorations, which they have such a wide and deserved reputation. is stand (No. 65, row C) will undoubtedly prove of great erest to all visitors.

The Moreau Marble Company, Limited,

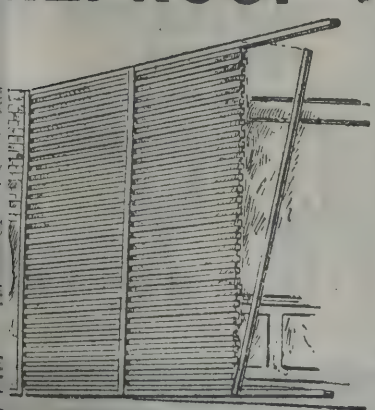
ow some excellent specimens of their new decorative struction — Moreau marble. This effective decorative terial is not a composition. It is obtained from the quarry blocks of any size of a strength and quality similar to the st Portland stone. After being worked in the original state in which it is quarried, the stone is converted into ble by the patented process with permanent colours, which pletely penetrate the block. It can be produced to corre- nd with any shade of the richest marble, either with natural ing, in self tints, or in solid inlays of any pattern or urs. It will take the highest polish and is suitable for rches, halls, interior and exterior finishings, balustrades or vings, baths, hospitals and wherever natural marble has erto been prohibited by considerations of price.

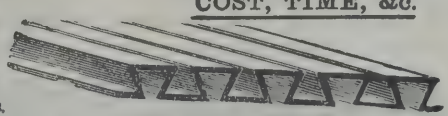
anitary Lead Lining & Pipe Bending Company, Limited.

This company are showing specimens of their patent lead- d iron pipe, with joints, bends, angles, T-pieces, &c., for n, soil, ventilating, waste and other pipes (Brighton & ning's patents). These pipes and fittings have the ordinary oth and non-corrosive lead pipe as a lining, and are pro- ed by a casing of best quality iron. A perfect joint is ays insured. They are easily and quickly fixed without the of scaffolding. Hot water can be discharged through them perfect safety, and the total cost when erected does not ed that of ordinary 8 lb. lead. This company's system is g used by H.M. Government, School Board for London, ernment buildings, hospitals, institutions and other public private buildings.

Diespeker & Co.

Attention will be attracted to Messrs. Diespeker's exhibit by conspicuous name-board which dominates the hall, and by the excellent quality of work shown, among which will be found a sample of circular skirting and Venetian marble mosaic as executed in the various fever hospitals of the Metropolitan Asylums Board; a sample of circular skirting and border as used in the new Birmingham General Hospital; a design of Roman (cube) marble mosaic as executed at the Hotel Cecil; a design of mosaic floor as executed at the Royal College of Music; a design of mosaic executed at Restaurant Frascati, Oxford Street; a sample of Venetian marble mosaic as executed at the new General Post Office, St. Martin's-le-Grand; samples of Venetian marble mosaic as executed at the new County Infirmary, Bedford; and other specimens, all of which are excellent in point of design, colour and finish.





Shanks & Co.

Messrs. Shanks & Co, who occupy their accustomed position in bay 1, make an attractive display as usual, although they do not claim to show any special novelties this time. Specimens are shown of their "Perfecto," "Fin de Siècle," "Independent," "Modern" and "Times" baths; lavatories of various descriptions, in designs simple or elaborate, in marble, slate and fireclay; syphonic and wash-down closets, and their special combination closets, with syphon and single-valve cisterns.

James Gibbons.

Mr. James Gibbons, of Wolverhampton and London, has an excellent exhibit of new designs in brassfoundry and locks. A very special feature of this exhibit is the artistic arrangement and decoration of the stand, which may be described as a symphony in green and yellow, designed by the well-known London manager, Tom Jones, whose panic bolts are so generally used in theatres and public buildings. In this unique exhibit are also many of his new designs and finger plates, letter plates, bar handles, &c. One special exhibit is a new patent lock for hotels, asylums, public buildings, &c. This is so designed that it is impossible for any ordinary key to be made into a master key, as so frequently has been done, and robberies committed thereby. Although the latest patent this firm has produced, we learn that many large orders for asylums and hotels have been secured for these locks. Another lock which deserved attention is the Tom Jones patent "Combined" turn, push and pull, and will no doubt meet with a great demand. At this stand will also be found sample fittings of the

E.C. Reversible Window Co., Limited, of which Mr. Gibbons is chairman and Mr. Jones managing director. These fittings are used by many of our leading architects.

Charteris & Longley.

Messrs. Charteris & Longley show wood-block flooring in various woods and designs, laid on their well-known patent system, and some admirable specimens of parquetry and joinery. The woods used include jarrah, maple, oak, walnut, mahogany, &c., and some of the patterns in which several woods are employed are very intricate and handsome, and entail a large amount of skill and labour. It is noteworthy that all the timber employed by this firm is thoroughly seasoned by Shapland's patent process, a model of which is shown. By this system the wood is subjected to a special treatment of steam and cold air regulated by fans to preserve the desired temperature, which never exceeds 80 deg., for the proper seasoning of the wood without injury to its fibre. This is found to effectually prevent cracking, twisting, warping, &c.

John Burn.

Mr. John Burn, at Stand 111, Row F, shows samples of slag from the Tees Bridge Slag Crushing Works, Stockton-on-Tees, samples of artificial stonework from the Norton Slag and Concrete Works, and some specimens of Brown's patent perfect sewer-pipe and other joints.

Stiff & Son.

Messrs. Stiff & Son's exhibit at once invites attention to the exquisite specimens of architectural terra-cotta displayed. Among these are columns, capitals (several of which are of noteworthy excellence), panels, &c., and especially a grand semi-circular panel in high relief. Among the minor wares, for the manufacture of which the firm has established such a well-known reputation, are drain pipes, channel pipes, kitchen sinks, latrine ranges, urinals, fire bricks, &c. A photograph is shown, too, of the Government House recently erected at Rangoon, the materials of which are red brick and terra-cotta, manufactured by Messrs. James Stiff & Sons, of Lambeth, who had no ordinary task to perform in supplying about 30,000 cubic feet of terra-cotta, manufactured from drawings made some 7,000 miles away, and sending them out ready for placing. This, however, was all successfully done. The terra-cotta arrived in regular consignments every three weeks, and the architect states that "each piece fitted exactly into the pla intended for it, and no trouble was experienced either fr crooked pieces or bad joints." This happy result, we may a speaks also for the care with which the detail drawings m have been made, and architect and manufacturer may sh the credit.

Moorwood, Sons & Co., Limited.

The central figure of this extensive exhibit is, prope enough, the central hot-plate and cooking range, 9 feet 4 feet 6 inches, with descending flues. This type of range h been specially designed by Moorwood, Sons & Co., Limit for hotel and club work and to meet the requirements of t best French *chefs*. Many other specimens of cooking sto and apparatus are also shown, as well as some handso specimens of sitting-room grates and mantels. One of the a brass grate of elegant design and handsomely carv mantelpiece in dark carved oak, is particularly worthy examination.

Dowson, Taylor & Co.

Messrs. Dowson, Taylor & Co. are showing in one of t eastern bays full-sized working models of their self-acti armour-plated, fireproof door, the automatic manipulation which is very ingenious and efficient. The doors, which a of either sliding or swinging variety, are rendered sensitive the slightest pressure, whether for opening or closing, means of a counterpoise dependent from a link which is fusi at a temperature of 150 degs., the result being that in the ev of such a door being open when a fire breaks out the temp ture soon reaches the necessary altitude, the weight drops a the door necessarily and infallibly slides or swings into place. Fire-extinguishing apparatus is also shown here.

The New Malden Potteries and Brick Works, Limited.

At stand 124, row 1, is an exhibit of specimens of fa brickwork, which were shown at the exhibition of 1851 b predecessor of the New Malden Potteries and Brick Wor Limited, and which were awarded honourable mention there It is in the form of a window-arch which has been removed fr the company's works, and speaks well for the hardness a durability of the bricks of which it is formed, the edges bei for the most part as sharp as when leaving the moulder's han Agricultural drainage pipes, crucibles, slurry-pots, horticult

This Leicestershire firm of brick and tile manufacturers ow some good specimens of red Leicestershire facings, smooth essed sand stocks, moulded bricks, quarries, roofing tiles, ecial hard bricks for sewers, flower pots, &c.

James Woodward.

Mr. James Woodward, Swadlincote, near Burton-on-Trent, ows a very large and attractive assortment of sanitary ware, cluding his "Kensington" syphonic wash-out basins, Free-an's patent inspection chambers, with improved glazed bottom ocks for the channels and side banks, the advantage being at a glazed surface is presented to the sewage instead of the ual cement one. His brown-glazed stoneware pipes are nspicuous for their smoothness and finish. Strong special inted pipes are shown, the well-known "Archer" for water-gged ground, the "Woodward Double Seal," and Ewing's ccentric shoulder-socket pipe, for securing a true invert in ains and sewers.

Ratner Safe Company, Limited.

In bay six the Ratner Safe Company have an extensive dis-ay of their new safes, both in course of construction, and ished with all the finesse which distinguishes this firm's oductions. The improvement in the Ratner twelve-corner-nt safe, as it is called, consists in bending and flanging the dy thereof. The top, bottom and sides are formed of a ate of steel bent at the corners, and the back and front ges are bent or flanged inwards, and the bolts at front the door and the continuous bolt at back of door oot behind these flanges. The back and the jointless el frame are placed on the inner face of the flanges. Without bending these flanges back, it is impossible either to take out the back plate of the safe or to open the door without unlocking it. The bending of the flange of a half-inch body requires a pressure of about 300 tons. The great advantage gained in this arrangement is the doing away with the outside bands, which are only attached to the body by screws and rivets, and also doing away with outside joints, both of which all safe makers must admit are a serious weakness. This improved construction enables the safe to resist a much greater fall than those made in the usual way can withstand. Another feature of the exhibit is a strong-room door made for the Capital and Counties Bank.

Frederick Jones & Co.

Messrs. Jones & Co. show specimens of their silicate cotton or slag wool for fire-proofing, sound-proofing or heat-proofing floors, walls, partitions, &c., for lining roofs of houses to render them impervious to climatic influences, for protecting iron girders in event of fire, for covering pipes, cisterns and other vessels exposed to extremes of heat or cold, for insulating purposes in cold-air stores, &c. Amongst F. Jones & Co.'s specialties in fibrous and other plaster slabs prominence is given to a special kind which has recently been finding great favour amongst architects and builders. It is very similar to fibrous slabs, but is made in larger sheets and has a finished face, so that the slabs can be fixed at once. These slabs are made with square edges, and can be papered over immediately. At this time, when working plasterers are something of a rarity, Messrs. Jones should have an extensive call upon them. We believe Messrs. Geo. Trollope & Sons have been making use of these slabs on a pretty large scale lately.

N.A.P. Window Company, Limited.

The N.A.P. stand will be found towards the centre of the hall. It is a comparatively small exhibit, but is an epitome of the many forms in which the various patented ideas have been worked out, and the advantages claimed for the casements are the following:—They open for ventilation in the same way as ordinary casements, and each is secured while open or shut by the usual casement-stay and fastener. When it is desired to clean the outside it is only necessary, before swinging the casement inwards, to lower the sill water-bar in the case of the "slip patent." They effect a considerable annual saving on

the cost of window-cleaning. As they open outwards for ventilation fresh air can be admitted without disturbing the window drapery. Repainting or reglazing can be conveniently done from within, and the injury which the use of ladders (carelessly handled) does to the sills and window masonry generally is thereby obviated.

Cliff & Sons.

The display made by this firm is as usual an imposing one, conspicuous among which are examples of architectural terra-cotta, of which there are some excellent specimens shown. Faïence mouldings and panels, too, are well shown. Bricks in variety are of course here, among them being specimens of Tiltman's patents, Shoppee's patent dovetailed and Adams's patent dovetail-keyed bricks, Hall's hanging tiles, "Grip" wall tiles, white enamelled and Yorkshire brown salt-glazed sinks (of every description), closets, lavatories, traps, gullies, pipes, furnace lamps, fire bricks, &c.

Gibbs & Canning, Limited.

One of the first objects to attract attention on entering the exhibition is the handsome and massive porch and portion of wall erected by this enterprising company from designs specially prepared for this exhibition by Mr. C. Harrison Townsend, F.R.I.B.A. It is in buff terra-cotta, is of noble proportions, and has an artistic decoration in conventionalised trees, of which the stems form pilasters and the foliage a frieze. Other exhibits of the company comprise glazed bricks—white, coloured and salt glazed, and in majolica colours—faïence mouldings and panels, terra-cotta and buff building bricks, glazed brick fireplace, Tiltman's patent partition bricks, Tiltman's patent continuous scum trough for swimming-baths, Tiltman's patent scum channel for swimming-baths, Shoppee's patent dovetailed bricks, &c.

Patent Vulcanite Roofing Company, Limited.

At the stand of this company, No. 33, row 8, may be seen specimens of the vulcanite roofing to which we have on several occasions drawn our readers' attention. It has been employed with very satisfactory results in the roofing of a large number of public and private buildings, both in England and abroad. Among these, perhaps, the most important are the Imperial Post Office and the Royal Palace of Justice, Cassel, Germany; Queen's Hotel, Westcliffe-on-Sea; Hydropathic Establishment, Ramsay, Isle of Man; the Mater Infirmorum Hospital, Belfast (where the roof is laid out as a garden), and numerous villas and terrace houses. It possesses the advantages of cheapness efficiency, lightness and durability.

John P. White.

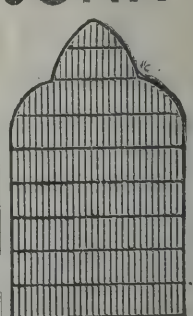
Mr. White is, as usual, showing some very fine specimens of carved chimneypieces in various woods and in all styles. Prominent among these is one specially designed for Sir Henry Burdett by Mr. E. T. Hall, F.R.I.B.A. Other fine pieces of work are from the designs of Messrs. C. E Mallows, C. H. B Quennell, C. F. A. Voysey, Alfred Cox, and a capital example on rather severe lines is by Llewellyn Morris.

Fireproof Partition Syndicate, Limited.

Cunnah-Wright's patent dovetailed corrugated iron sheet are to be seen in use in the building erected in row B (No. 43). They can be used for walls, partitions, floors, &c., and in addition to economy in cost, they possess advantages which are by no means to be lightly regarded, namely:—They are fire, sound, damp and vermin-proof. They can be rapidly erected and save a large amount of space. Sections of Cunnah Wright's patent laths are also shown.

J. C. Moore.

At No. 22, in row A, Mr. Moore shows specimens of his patent window-sash fittings, which appear to be very simple and efficient. Among the advantages claimed for them are the following:—The sashes are made in the usual way and are slung so that they are always bearing on the inner beading consequently they cannot rattle. Both sashes can be regulated in any position with the hand. A self-fastener operates when the sashes are closed, making it impossible to open them from without, while it pulls the meeting rails tight together and insures their being locked. They can also be regulated when high up by bringing the end of the cord down, or at a distance by carrying it to any part of the apartment or building. By stitching the end of a new cord to the old, and pulling the latter out by the other end, it is replaced in a minute by the new. By lowering both sashes to the bottom and turning in the hinged beading, and withdrawing the parting bead, the sashes can be turned inward like a door on its hinges for cleaning, &c. and they are waterproof.



The Wood-Carving Company, Limited.

An attractive display is made by this company of their Saracenic woodwork for Moorish fitments, grilles, screens, &

SANITARY PIPES. GLAZED BRICKS.

VOLUME LX. OF THE ARCHI Handsomely bound in Cloth, Gilt Le Price 12s. 6d.
Office: Imperial Buildings, Ludgate Circu

An admirable effect of lightness and grace is produced by this method of decoration, which, although quite consistently adaptable to modern everyday requirements, is of a distinctly Oriental intricacy of *motif*. It has been used with admirable results in the grand circle at the Alhambra and in a smoking lounge at the Hotel Cecil. The company is also showing carved overdoors, newel posts, panels, pediments, &c.

The Engraved Wood Company.

The Engraved Wood Company have a tastefully arranged stand on which they show specimens of panels, pediments, dadoes, friezes, brackets, mouldings, &c. These are produced by the company's patent pressure process, and the result has the effect of carving at a fraction of its cost.

S. & E. Collier.

In row D, Messrs. S. & E. Collier are showing some excellent specimens of red, smooth-faced, plain, dun colour and strawberry colour roofing tiles and wall tiles, a machine-made sand-faced tile, a patent rough tile that will vegetate like a hand-made tile, ornamental tiles for vertical tiling, eaves tiles, gable tiles, hip-and-valley tiles, angle tiles for square and octagonal buildings, red garden edging tiles, plain and ornamental red ridge tiles with fast tops, end ridge tiles for hips and intersections, ridge tile finials and terminals, terra-cotta for building construction, mural tiles, air bricks and panels, plain and ornamental chimneypots, &c.

William Griffiths.

Mr William Griffiths, London concessionnaire to the National Opalite Glazed Brick and Tile Company, has erected a pavilion in the walls of which the glazed bricks and tiles are used with artistic and pleasing effect. The principal of the system is absolutely simple. The surface is of glass, and the specialty lies in the roughening of the back, thus forming the key for the cement with which it is united to the brick or tile, or, if circumstances admit, to an existing wall. Many advantages are claimed for this system of wall glazing; among them are that the material is imperishable; it does not by exposure to lamp, frost, or heat, lose any of its beautiful polished surface, neither does it become patchy. There is a saving of nearly 10 per cent. on ordinary glazed work; it is readily repaired, and at much less cost than other systems of tiling or glazed work. Both old and new brickwork can be glazed; and the advantages of having walls glazed after the brickwork is finished are strongly urged, to secure a close joint and avoid a heavy waste in breakages. It is made in a variety of tints, and for beauty and brilliancy is far in advance of the old glaze. The surface being of a higher polish than ordinary glaze, dirt, &c., will not adhere to anything like the same extent. The reflecting power is far superior to that of any other glazing material, the reflected light is greatly increased, and none of its power is lost by exposure to damp.

Stanley Bros., Limited.

Here (at No. 91, row E) will be found a group consisting of salt glazed and blue bricks, other enamelled in white and colours, semi-encaustic paving tiles, roofing tiles, ridges and finials, ornamental red and buff terra-cotta garden vases, &c. Among the latter are some capital classical designs.

Wood & Ivery.

Messrs. Wood & Ivery have sent some specimens of their blue ware in paving bricks, kerbs, channels, conduits, &c. A conspicuous feature of the exhibit is a section of a conduit made of the blue bricks, of which they are supplying no less than 35,000,000 for the Birmingham water scheme.

James Austin & Sons, Limited.

The sash-lines, blind-lines, section-lines, halyard and log-lines exhibited by this company are too well known and of too stable a character to call for a lengthy description; but an inspection of the specimens shown (at 19, row A) makes it obvious that the well-known quality is rigorously maintained.

Mitchell & Co.

This firm has an exhibit near the centre of the hall, which contains a large variety of sanitary appliances in white enamelled fireclay:—Baths, sinks, wash-tubs, lavatories, closets, urinals, drain channels, interceptors, gullies, &c. Sanitary appliances in special glazed vitreous stoneware. Strutt's drain-pipes and fittings, interceptors, gullies, &c. Pedestal closets:—The "Hilton," the "Kent," the "Eclipse." White enamelled fireclay sinks:—The "London," the "Belfast," the "Edinburgh," the "L.S.B.," the "Combination," &c. Mitchell's patent inspection valves (for affording ready access to clearing arm of sewer-gas interceptors). Packingless water valves. Screw-down manhole covers (with removable working parts). A five-stall circular urinal made in one piece of glazed fireclay and a post-mortem table are the greatest novelties, but the firm also show some novelties in panelled glazed fireclay baths in adults' and children's sizes.

147 STRAND, LONDON, W.C. (First Floor).

British Non-Flammable Wood Company.

We have had several occasions to speak of the fire-resisting qualities of the wood prepared by this company's system, and we now see for the first time exhibited specimens of the various uses to which it can be applied, in addition to the forms in which we had previously seen it, *i.e.* as timber for house or ship building, &c. Here (at bay 8) may be seen, in addition to floorings, matchboards, laths, wood-block flooring, &c., specimens of skirtings, mouldings, wooden electric casings, balusters, doors, stairs, panellings, window-sashes, wooden mantels, brackets, chairs, stools, tables, wooden deed boxes, all made from the prepared wood which, it is thus demonstrated, can be used for any purpose to which unprepared wood can be applied; also non-flammable window curtains, gauzes and draperies of various kinds.

F. McNeill & Co.

Messrs. F. McNeill, whose stand is numbered 82 in row W, make a capital show with their specialties in patent slag-wool or silicate cotton, which is of great utility for sound-deadening, fire-proofing, insulating of heat and cold, &c., for which latter purpose it is claimed that it is unequalled by any other material whether natural or manufactured. Patent asphalted roofing felt for external roofing, fibrous asphalte damp-proof course, patent metal asphalte damp-proof course, dry hair felt for sound-deadening and for roof-linings to equalise temperature, patent pipe coverings, which are found very efficacious for protecting pipes from frost, or to prevent radiation of heat, &c.

Yates & Hayward.

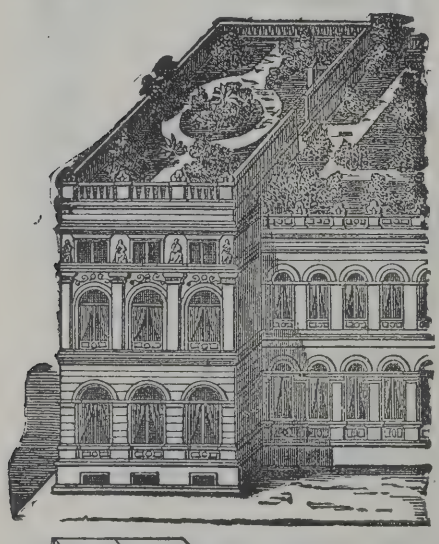
Against the east wall and close to the Upper Street entrance (in their old position, in fact), the handsome exhibit of this firm includes some excellent designs in stoves and mantels in wood, stone and iron. Among the latter are some new patterns, which are admirable alike from their excellence of design and perfection of casting. The "Quadrant" kitchener is a leading specialty of the firm. This stove, the appearance of which is handsome and suggestive of durability, has a self-adjusting lifting fire, which can be raised or lowered to any point with one hand The movable parts do not come in contact with the fire, consequently no wedging or getting out of order is possible. The range fire cheeks and the back boiler can be taken out without disturbing any other part of the kitchener. Over and under-draught ovens can be made with enclosed iron flues requiring no brickwork setting. It is easily fixed, and is said to be economical of fuel.

John Tann.

Mr. John Tann, who is located under the north gallery, has a representative collection of his widely-known "Anchor Reliance" bent steel fire and thief resisting safes for all purposes; party wall and warehouse doors, plate closet and strong room doors, banker's bullion vault doors, plate closets, all kinds of locks, cash and deed boxes, &c.

(*To be continued.*)

THE METHODIST MILLION FUND.



The total amount already promised to the Methodist Million Fund is 714,125*l.*, and as contributions are rapidly pouring in there appears to be very little doubt that before January 1, 1901, when the lists are to be closed, the Wesleyan Methodist Twentieth Century Fund will have reached the sum contemplated by its promoters. Among the various objects to which the fund will be applied are the following:—300,000*l.* to assist in the purchase of sites and the erection of Wesleyan Methodist places of worship, Sunday schools, mission-halls and soldiers and sailors' homes in the United Kingdom; 250,000*l.* for the purchase of a site in West London, near Regent Street or Charing Cross, and the erection thereon of a Wesleyan central hall. The buildings are to contain a large hall to hold 3,000, a smaller hall to hold 1,000, a library to hold 500, with various committee-rooms and offices for the departmental work of the Methodist Church. This hall will become the head-quarters of the West London Mission, whose services are at present conducted at St. James's Hall.

SECURITY AGAINST FIRE.

In the *Times* Lord Fortescue gives the following account of the measures he has adopted for the preservation of a country house in case of an outbreak of fire:—

Having determined to improve the arrangements for extinguishing fire should any break out in my country house Castlehill, I last year made on the hill close behind it a new reservoir (with the provision for keeping it full) holding 50,000 gallons, nearly 50 feet above the highest point of the roof, with a 6-inch pipe leading straight down from it at a very steep

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been ad by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hosp Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and su than under any other roof. When properly laid repairs are never required, and all roo guaranteed. The roof-surface can be used as a garden, or for any other purpose. The c construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRID TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up inches, being more convenient than the usual damp-course slabs, and saving laps. Price lowe quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., an SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requi annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

gle for the supply of several standpipes and hydrants with -inch hose outside the house, sufficient to command all the emises.

But besides these precautions I adopted another, of which heard for the first time last year, which has already secured e the benefit of a substantial reduction in the premiums of e policies I am henceforth to pay. I think I can hardly scribe this recently introduced system better than nearly in e words of the letter addressed by me from Castlehill to the e office, which led it to make a further reduction of about ır-ninths in the premiums payable by me beyond what it was fore prepared to make in consequence of the new reservoir d the stand-pipes, &c., connected with it. These reductions ord a conclusive proof that the company believes in the cacy of the system, which leaves the large stand-pipes and ses as available as ever to discharge large volumes of water equired by the continuance of the fire.

This system has involved at Castlehill two mains inside, at east and west ends of the main building, constantly urged at full pressure, with an inch hose attached on h floor capable of being filled by the mere turn of a valve, l terminating in a copper nozzle of corresponding size. I ve six of these, three at each end of the house, long enough reach between them into every room. All six are so light d handy that any man or woman can easily walk away with her of them after turning the valve, and direct a slender but cible jet from it upon any flame as soon as it is perceived.

I first heard of this system from its author, the distinguished of a far more highly distinguished father, my valued friend nearly half a century, the late Sir Edwin Chadwick, K.C.B. ay the distinguished son, because my friend Mr. Osbert dwick, C.E, who had been my guest here years ago, ried out works of water supply for various towns in various ntries, and had his success in doing so in some of our mies rewarded by the Order of St. Michael and St. George. He told me that, agreeing in the general recognition of the nense importance of saving minutes, and even seconds, in ling with fire when first breaking out, and having satisfied self that even when a fire was happily extinguished pretty n the damage done by the large volume of water discharged n the usual hoses of 2 to 3 inches in size very often greatly eeded that done by the fire, both to the structural decora- s, such as ceilings, cornices, &c., and to the contents of building, such as furniture, hangings, books, &c., he had some time recommended the adoption of the system just described not only for mansions, but also for factories with their delicate and costly machinery. He believed that both as regards expedition in suppressing fire on its first appearance, and as regards the great additional security from extensive damage by water (for which, in case of its use in dealing with a fire, insurance companies are liable), the separate provision of such small constantly-charged hoses would be found decidedly economical, notwithstanding its undeniable additional cost. In confirmation of Mr. Chadwick's view I have observed that the damage done by water at Hyde Park Court is stated to have been considerable.

I should add that the adoption of the system where it is applicable in towns ought not, in his opinion, at all to supersede calling in the public fire brigade, but only to enable the inmates of a house to do something really useful, considering the immense importance of minutes in dealing with fires, before the arrival of the brave and skilful experts of the brigade.

ILLICIT COMMISSIONS.

THE following is the text of the Bill which was introduced in the House of Lords on the 20th inst. by Lord Russell of Killowen :—

Whereas secret commissions in various forms are prevalent to a great extent in almost all trades and professions, and in some trades the said practice has increased and is increasing.

And whereas the said practice is producing great evils, by corrupting the morals of the community, and by discouraging honest trade and enterprise, and it is expedient to check the same and other kindred malpractices, by making them criminal.

Be it therefore enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal and Commons in the present Parliament assembled, and by the authority of the same, as follows :—

I. Every person who shall corruptly by himself or by any other person, and whether directly or indirectly—

(*a*) Give any valuable consideration to, or to the use of, any agent, or

(*b*) Offer to give any valuable consideration to, or to the use of, any agent, shall be guilty of a misdemeanour, and in Scotland of an offence punishable by fine and imprisonment.

II. Every agent who shall corruptly by himself or any other person, and whether directly or indirectly—

THE PROBLEM SOLVED.

IDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

RICE LIST AND ESTIMATES ON APPLICATION

(*a*) Receive any valuable consideration from any person, or

(*b*) Solicit any valuable consideration from any person shall be guilty of a misdemeanour, and in Scotland of an offence punishable by fine and imprisonment.

III. Every valuable consideration given or offered to any agent by any person having business relations with the principal of such agent shall be deemed to have been corruptly given or offered unless it be proved—

(*a*) That the principal had given his consent thereto, or

(*b*) That the valuable consideration was not calculated or intended and had no tendency to corrupt the agent by inducing him to do or to leave undone something contrary to his duty, or by creating any other undue influence on the mind of the agent.

IV. Every valuable consideration received or solicited by any agent from any person having business relations with the principal of such agent shall be deemed to have been corruptly received or solicited unless it be proved—

(*a*) That the principal had given his consent thereto, or

(*b*) That the valuable consideration if and when given would not have been calculated or intended, and would have had no tendency to corrupt the agent by inducing him to do or to leave undone something contrary to his duty or by creating any other undue influence on the mind of the agent.

V. Every valuable consideration given or offered to any parent, husband, wife or issue of any agent, by any person having business relations with the principal of such agent, shall be deemed to have been corruptly given or offered unless it be proved—

(*a*) That the principal had given his consent thereto, or

(*b*) That the valuable consideration was given or offered not with intent to corrupt the agent, but for some reasonable and honest cause and independently of all business relations with the principal.

VI. Every valuable consideration received or solicited by any parent, husband, wife or issue of any agent, from any persons having business relations with the principal of such agent, shall be deemed to have been corruptly received or solicited by the agent, unless it be proved—

(*a*) That the principal had given his consent thereto, or

(*b*) That the valuable consideration was received or solicited by the parent, husband, wife or issue, without the consent, knowledge or privity of the agent, or

(*c*) That the valuable consideration if and when received would not have been calculated or intended, and would have had no tendency to corrupt the agent by inducing him to or to leave undone something contrary to his duty, or creating any other undue influence on the mind of the agen

VII. The receipt of any valuable consideration, in c sideration or in respect of any advice given, or to be given the recipient to any third person for the benefit of the per making the gift, shall be deemed corrupt, unless it be pro that the fact of such gift, and the nature and particulars ther were made known to every such third person as afores before or at the time of the advice being given as aforesaid in the case of such gift being made after the giving of advice, without previous offer, agreement, or arrangemen give the same, then immediately after such gift shall be ma

VIII. Every gift of a valuable consideration, and e offer to give a valuable consideration to any person in sideration or in respect of any such advice aforesaid, with intent that the same gift or offer shall not be made know the third person aforesaid, or with the knowledge that it not be made known as aforesaid, shall be deemed corrupt the part of the person making the gift or offer.

IX. If any person shall give to any agent any rec account, or other document, in respect of which the princ is interested, which (*a*) shall contain any statement which i the knowledge of the said person false, or erroneous, defective in any important particular, or is in any way ca lated or intended to mislead the principal; or (*b*) shall ot wise, than by mistake or inadvertence, omit to state explic and fully the fact of any discount, rebate, repayment, grat or deduction having been made, given, or allowed, or ag to be made, given, or allowed, or any other fact in relatio the transaction which it shall be for the interest of the p cipal to know, shall be guilty of a misdemeanour, an Scotland of an offence punishable by fine and imprisonmen

X. The omission of an agent to receive some valuable sideration which he was entitled to receive from his princ or to make some charge, claim, or demand upon his princ shall not be admissible in evidence to show that the recei a valuable consideration by the agent was not corrupt, shall be admissible to diminish the sum which the agent be ordered to pay as hereinafter provided.

XI. Where a valuable consideration is given, in consid tion or in respect of any advice given or to be given, and of some services to be rendered or work done, or of any o matter or thing whatsoever, the fact that the valuable sideration was given partly in consideration or in respec

THE LARGEST MANUFACTURERS OF WOOD CHIMNEY-PIECES IN THE KING
ESTABLISHED OVER 20 YEARS.

such services, work, matter or thing, shall not be accepted as proof that the receipt of the said valuable consideration was not corrupt.

XII. Any person on conviction of offending, as aforesaid, shall, at the discretion of the Court before which he is convicted—

(*a*) Be liable to be imprisoned for any period not exceeding two years, with or without hard labour, or to pay a fine not exceeding 500*l.*, or to both such imprisonment and such fine; and

(*b*) In addition, be liable to be ordered to pay to such person and in such manner as the Court directs the amount or value, according to the estimation of the Court, of any valuable consideration received by him or any part thereof, and such order shall be enforceable in the same manner as a judgment of the High Court; and

(*c*) In addition, if such person would otherwise have been entitled to any pension or compensation, be liable to forfeit his right and claim to such pension or compensation.

XIII. When an offence under this Act is also punishable under any other enactment or at common law, such offence may be prosecuted and punished either under this Act or under the other enactment or at common law, but so that no person shall be punished twice for the same offence.

XIV. A person shall not be exempt from punishment under this Act by reason of any invalidity in his appointment, employment or election.

XV. A Court of general or quarter session shall, in England, have jurisdiction to inquire of, hear and determine an offence under this Act.

XVI. If a Court of summary jurisdiction upon the hearing of a charge under this Act is of opinion that the offence may be adequately punished by virtue of the powers of this section the Court shall cause the charge to be reduced into writing and read to the person charged, and then address a question to him to the following effect:—"Do you desire to be tried by a jury, or do you consent to the case being dealt with summarily?" and if such person consents to the case being dealt with summarily the Court may summarily convict him, and at the discretion of the Court sentence him to imprisonment for any period not exceeding three calendar months, with or without hard labour, or to pay a fine not exceeding 50*l.*, and, in addition, order the person convicted to pay such person and in such manner as the Court directs the amount or value, according to the estimation of the Court, of any valuable consideration received by him, or any part thereof, but so that the amount or value shall not exceed 50*l.*

XVII. A person who is called as a witness in any proceedings shall not be excused from answering any question relating to any offence under this Act on the ground that the answer thereto may criminate or tend to criminate itself, or on the ground of privilege.

Provided that—

(*a*) A witness who, in the judgment of the Court, answers fully all questions which he is required by the Court to answer, shall be entitled to receive a certificate under the hand of the presiding judge or member of the Court stating that such witness has so answered.

(*b*) An answer by a person to a question by or before the Court in any proceeding under this Act shall not, except in the case of any criminal proceedings for perjury in respect of such evidence, be in any proceeding, civil or criminal, admissible in evidence against him.

XVIII. If a person having received such certificate as aforesaid, and any criminal proceeding be at any time instituted against him in respect of the offence which was in question in the proceeding in which the said person was called as a witness, the Court having cognisance of the case shall, on proof of the certificate and of the identity of the offence in question in the two cases, stay the proceedings, and may in their discretion award to the said person such costs as he may have been put to in the proceedings.

XIX. Nothing in this Act contained shall prejudice or affect any cause of action or right in equity which may arise from any corrupt payment, or any matter dealt with by this Act, or shall postpone or otherwise affect the maintaining or enforcing of any such cause or right.

XX. The expenses of the prosecution of an offence under this Act shall be defrayed in like manner as in a case of felony.

XXI. In the construction of this Act the following provisions shall apply:—

(i.) The word "agent" shall include every factor, agent, clerk or servant, and also every person employed for the purpose or in the capacity of a factor, agent, clerk or servant, and every architect, clerk of the works, engineer, solicitor, surveyor, lawyer, salesman and foreman, and every person employed in a position of trust or confidence, and shall extend to persons in employment either alone or jointly with any other person.

(ii.) The word "principal" shall include every principal, master and employer, whether individuals or partnerships, companies, corporations, councils of a county or county of a city or town, district and parish councils, boards, commissioners, select vestries, or bodies having power to act under and for the purpose of any Act relating to local government, or the public health, or the poor law, or otherwise to administer moneys raised by public rates.

Provided always that no such consent as is before mentioned shall be given except by individuals or partnerships or by private companies consisting of not more than ten persons.

(iii.) The words "valuable consideration" shall include any money, gift, loan, office, place, employment, fee, reward, benefit or advantage whatsoever, and any forbearance to demand any money or money's worth or valuable thing, and the acceptance of any of the said things shall be deemed the receipt of a valuable consideration.

Provided always that the following things shall not be deemed to be valuable considerations within the meaning of the Act, that is to say:—

(*a*) A vale or gratuity bona fide given as such by a guest to the servant of his host.

(*b*) A gratuity bona fide given as such to a menial or domestic servant or porter for a legitimate service rendered or to be rendered to the donor, in conformity with the scope of the servant's or porter's employment by his master.

(*c*) Meat or drink or accommodation reasonably and bona fide given by way of hospitality only.

(iv.) The words "valuable consideration," when used in connection with the offer thereof, shall include any agreement or promise to give, and every holding out of any expectation of giving any valuable consideration.

(v.) The words "valuable consideration," when used in connection with the receipt thereof, shall include any acceptance of any agreement, promise or offer to give, and of any holding out of any expectation of giving any valuable consideration.

(vi.) The words "solicit any valuable consideration" and "valuable consideration solicited," shall be construed with the following direction, namely:—That every agent who shall divert, obstruct or interfere with the proper course of business or manufacture, or shall impede or obstruct, or shall fail to use due diligence in the prosecution of any negotiation or business with the intent to obtain the gift of any valuable consideration from any person interested in the said negotiation or business, or with intent to injure any such person, shall be deemed to have solicited a valuable consideration from a person having business relations with the principal of such agent.

(vii.) The words "persons having business relations with a principal" shall include every person carrying on, or having carried on, or desirous or intending to carry on, any negotiation or business with, or engaged, or having been engaged, or desirous or intending to be engaged in the performance of any contract with or in the execution of any work or business for or in the supply of any goods or chattels to any principal.

(viii.) The words "advice given" shall include every report, certificate, statement and suggestion intended to influence the person to whom the same may be made or given, and every stipulation, requirement, or condition as to the use of the goods of any third person or otherwise, for the benefit of such third person, and every influence exercised by one person over another for the benefit of a third person.

(ix.) The expression "A Court of Summary Jurisdiction" shall have as regards England the meanings assigned to it by the Summary Jurisdiction Act, 1879, and shall as regards Ireland mean any justice or justices of the peace, stipendiary or other magistrate or magistrates having jurisdiction under the Summary Jurisdiction Acts.

(x.) The expression "Summary Jurisdiction Acts" shall have as regards England the meanings assigned to it in the Summary Jurisdiction Act, 1879, and, as regards Ireland, shall mean within the police district of Dublin metropolis, the Acts regulating the powers and duties of justices of the peace for such district or of the police of that district and elsewhere in Ireland, the Petty Sessions (Ireland) Act, 1851, and any Act amending the same.

XXII. This Act shall come into operation on January 1, 1900.

XXIII. This Act may be cited as the Act to Check Corruption, 1899.

AMERICAN BOLTS AND NUTS.

Mr. Rufus Fleming, the United States Consul in Edinburgh, in a report to his Government, dated March 20, says:—Inquiry has been made at this Consulate by a wholesale agent, handling largely bolts and nuts and like articles, for the name and address of a company or firm in the United States manufacturing bolts (round and square, countersunk heads) and cold-cut nuts. He wishes to obtain this particular combination for the Scottish market. This business man informs me that the American manufacturers are now pushing the Germans very hard for the trade in bolts and nuts in the United Kingdom. The importation of these articles from the United States

began about eighteen months ago. For many years the German manufacturers had little or no foreign competition in these islands for machine-made bolts and nuts, and the British manufacturers could only hold the market for the common square-head bolts. In 1897 bolts and nuts began to come from the United States, and the trade has been growing. Of late it has been increasing rapidly. In this dealer's opinion, should there be no reduction of prices by the German and no increase of prices by the American manufacturers, the latter will soon get the bulk of the trade. The process of gaining the market would be easier, he says, if some of the American bolt and nut manufacturers did not persist in sending the goods in packages of 100 and of 50, although they know that it is the custom in the retail trade here to buy bolts and nuts by the gross and half-gross.

PROPOSED KENSINGTON IMPROVEMENT.

On Monday the Tribunal of Appeal, consisting of Mr. Arthur Cates (president), Mr. J. W. Penfold, and Mr. A. A. Hudson (legal adviser) sat at the Surveyors' Institute, Strand, for the purpose of deciding an appeal brought against the London County Council by the trustees of the Phillimore Estate, Kensington, under the London Building Act. Mr. Macmorran, Q.C., with Mr. Harpur, appeared for the appellants, and Mr. Seager Berry for the London County Council. Mr. Macmorran said the point of the case was that the trustees of the Phillimore Gardens Estate, Kensington, desired the sanction of the tribunal to a scheme for the laying-out of certain streets in Kensington. During his life the late Captain Phillimore, who died in February 1887, let Moray Lodge, Kensington, for a term of eighty years, together with the land surrounding it, on lease. The leaseholder at once proceeded to develop the estate, and borrowed largely to lay out the land from Captain Phillimore. At the captain's death large sums borrowed by the lessee were outstanding and became due to the personal estate of Captain Phillimore. These the lessee was unable to meet, and by an arrangement come to with the Chancery Court he was released from his liability under certain terms. Since then the advisability of dealing with the estate and land had been gone into, and, under advice, the trustees had decided to develop it by laying out streets, widening the existing thoroughfares, and erecting properties more marketable as a letting commodity than those at present existing. The plans of the proposed improvements had been submitted to London County Council, and that body had refused to sanct them. Why, he failed to see, because the public were benefit as much as the trustees of the estate. Mr. E. J. A. Balfour, E Chesterton and Mr. William Weaver, chief surveyor to Kensington Vestry, also gave evidence in support of appeal. Mr. Seager Berry, for the respondents, said London County Council refused to sanction the plans becau according to the general scheme, the proposed streets to formed would not at and from the time of laying-out afford dir communication with the existing streets. The object of Building Act was to prevent such streets being formed. tribunal disallowed the appeal, but made no order as to cost

PATENTS.

[*This List of Patents is compiled specially for this Journal Mr. G. H. Rayner, of the firm of Rayner & Co., C sulting Patent Agents, 37 Chancery Lane, London, W from whom all particulars and information relating Patents may be had gratuitously.*]

Applications for Patents

7452. George Benson, for "Improved bracket for windo blind rollers."

7489. Bernard Liban, for "Improvements in or relating kilns for the manufacture of cement."

7541. John Thornton, for "Improvement in brick-presse

7550. James Rankine Cantley, for "New or improved l for windows and the like."

7561. John Morgan and David Jeremiah, for "Impro ments in chimney-pots."

7640. Henry Gorton, for "Improvements in porta window-seats for cleaning, painting or repairing windows."

7693. William Isaac Belchan and James Gush, for " provements in window and other sashes."

7741. John Thompson, for "An improved building brick

The Architect.

THE WEEK.

CH artists are constantly expounding new or revived es of æsthetics in their works, and therefore it is lt to classify all the "isms" which have repre- ives. For each there can be found a logical nstration. One of the latest will be exemplified by emorial of ALPHONSE DAUDET when it is seen in The novelist was a frail little man with a head that most ideal in its intellectualism. The commission for atue has been given to M. SAINT-MARCEAUX. His tention was to follow the usual routine, and set up a on a pedestal to be designed by an architect selected nself. After producing several models with which he ot satisfied, M. SAINT-MARCEAUX resolved to try a experiment. Could not the pedestal be omitted? so it became necessary to find a substitute, as the would appear odd if the feet touched the ground. sculptor, after long pondering over the problem, d to demonstrate to all that a statue was carved out lock of marble, and for that purpose, but contrary to stomary practice, a large part of the unwrought e is to remain, and will be used not only instead of a al but as a support for the right arm, and on the surface es of DAUDET's books will be inscribed. The proposal ceived approval, but when it is found that contours be sacrificed, and that at a distance and from some of view the memorial will appear an amorphous there may be a return to the practice adopted by sculptors, although involving the giving of a com- n to an architect for a pedestal.

CHITECTURAL beauty is not a quality which is recog- y the Legislature or the Courts. Building Acts are in which provisions are made to render many things nsable, but the ugliest house which can be devised rated so long as the provisions of the Acts are ed. The Courts disapprove of trustees investing in buildings which are possessed of architectural on the ground that style is subjected to the laws ion, and the vogue of to-day may be considered us to-morrow. If the authorities of towns en- red to secure more respect for appearances in new gs, we have no doubt powers would be given by he plans of ugly houses need not be approved. But e necessary for the authorities to combine to achieve i. To compel every town to obtain a special Act purpose would entail so much expense, the public e prejudiced against the efforts. The difficulties in of reform were suggested this week in the Eccles Town . One of the members asked whether the improve- nd building committee had power to refuse plans if ations of proposed buildings were of such a character preciate the value of surrounding property, and if the tee could do nothing, would the Town Clerk say the Council could obtain powers in an omnibus eject plans of that description? The chairman of mittee said that body had no power to refuse plans as they were in conformity with the by-laws. They ot, therefore, interfere as between proposed build- l adjoining owners. The Town Clerk stated it was ficult to say what powers the Corporation could One or two municipalities had obtained extra- powers for schemes of street improvement; but of no case in which they had been made to apply all over a borough. In fact we believe there is and a man has a right, so long as he complies with ws, to erect a building which will have an injurious all the property in its vicinity. Why does not les Council endeavour to gain the reputation of a crusade against the perpetuation of ugly s?

AWS are not of much service unless they are en- ithout restriction. Sometimes they are supposed pressive, and if anyone escapes from their operation s jealousy. In Chelmsford a case has occurred ggests that a by-law can be interpreted in more than one way. A building was erected on the site of the old market house, Tindal Street, but the usual procedure of submitting plans prior to the commencement of the works was disregarded. The Town Council should have taken steps to compel respect for their by-laws, but they hesitated. Why there was an exception has not been stated. A committee was appointed to consider the subject, and the opinion of Mr. MACMORRAN, Q.C., was obtained. That gentleman considered that the building was new, and therefore plans should have been submitted for approval prior to the commencement of the works. Moreover, as respects air space and height of top floor, there was no compliance with the by-laws. Although fortified by counsel's opinion the Council continued inactive. Nobody professed ability to understand what was next to be done. The sub-committee to whom the subject was relegated said:—"It must be remembered that, acting upon a former opinion of Mr. MACMORRAN, the town clerk and the surveyor did certainly intimate to the Council and also to the surveyor to the owners, that the building as proposed did not come within the by-laws. Under these circumstances your sub-committee are of opinion that it would be doubtful whether any action taken would now be successful. Your sub-committee are, however, of opinion that in any future case of a similar kind the requirements of the by-laws as to the deposit of plans and other matters should be enforced even if it should become necessary to test the matter by legal proceedings." Everything appears to be in a muddle. The Council may hereafter have sufficient energy to assert the authority of the by-laws, but their action cannot condone the mysterious neglect exhibited in connection with the market house.

AFTER a fortnight's consideration the select committee of the House of Commons have declared that the preamble is proved of the London Improvements Bill of the London County Council so far as regards the Strand and Holborn improvements. It has also been declared that the land south of the Strand is to be excluded from the betterment area, and that the making of the road is to remain in the hands of the County Council. That conclusion was anticipated. The improvement has long been called for, and if further delayed would be an obstacle to the progress of London. The County Council, we suppose, will endeavour to have the thoroughfare made as expeditiously as possible. What is now most desirable is an assurance that the County Council will exercise a controlling power over the style of the buildings which are to be erected along the roadway. The street will be well adapted for the display of good examples of architecture, and for that reason we hope more care will be exercised in the approval of plans than has been customary with some other new roadways.

A THOUSAND years ago there was a diocese of Hexham, but owing to Danish invasions the see could not remain independent, and had to be transferred to Durham. There was a magnificent minster, which was described as "the goodliest church on this side of the Alps." A long account of it was prepared by Abbot RICHARD, but it is so detailed it is hardly comprehensible at the present day. From time to time money has been laid out on the restoration of the abbey, but the results were not always satisfactory. According to Canon GREENWELL, a chantry chapel, which contained some very fine woodwork of the end of the fourteenth century period, was entirely swept away for no reason whatever. The woodwork was ultimately sold to Mr. CRUDDAS. The whole east end of the church had also been taken down, and a very poor unsightly window and east end put in. This was so bad that not very many years afterwards it was removed and the chapel restored as near the original as possible. It is now proposed to expend 3,500*l.* on restoration works, but the Canon says that whatever is done will be well done. There is to be no destruction, and the works, it is anticipated, will not offend the most conservative lover of antiquity. Canon GREENWELL is a member of the committee, and he says he declined to accept the position until he was assured about the character of the measures which are contemplated. He anticipates that Mr. CRUDDAS will give back the woodwork of the chantry chapel, and that it can be replaced in its original position.

PAINTING AT THE ROYAL ACADEMY.—I.

ALTHOUGH it is already generally accepted that this year's Academy exhibition is below the average, visitors need not be afraid of misspending a shilling by going to Burlington House, and those who contemplate the purchase of pictures will find many attractive works awaiting them. Considered as a spectacle the collection may be disappointing, but we are not disposed to believe there is no other way of judging the pictures. The public expect to have dramatic scenes on the canvases. The manner of painting, the composition, colouring and draughtsmanship are supposed to be of inferior importance in London, although elsewhere it is style rather than subject which fascinates. The exhibition does not present many pictures that are impressive by their tragedy or their comedy, and in consequence it is declared to be a failure. It may be granted there is much to be seen which is commonplace, but as compensation there are also works having an interest which, although not shared by the public in general, is, however, genuine.

Take, for instance, a quality which appeals to the majority of our readers. Architecture this year asserts itself in a great many of the pictures. Chief among them is Mr. Alma-Tadema's *Thermæ Antonianæ*, or Baths of Caracalla. The artist undoubtedly had data to work upon, for everyone knows how extensive are the ruins. But the number of theories and the various attempts at restoration are enough to put the baths outside the category of paintable subjects. Mr. Alma-Tadema has accustomed us to elaborate presentations of Roman interiors, but we doubt if he attempted one before which was equally difficult. He has made a great effort and has succeeded in producing a remarkable building, although it is not to be expected that all will be satisfied with the arrangements. Shelley was amazed at the sight of the flowery glades and thickets which extended in ever-winding labyrinths upon the immense platforms and dizzy arches of the ancient structure. But it is more amazing to be told by Roman writers that the roof was altogether supported by bronze or copper railings. A dozen archæologists would have a dozen solutions of the difficulty, and we must not criticise the painter's restoration as if it were one of those produced by the architectural prizemen in the Villa Medicis. It seems to us that Mr. Alma-Tadema has been too loyal to architecture. If the three girls who are chatting in front could be cut out they would form a delightful picture, and as only a part of the great marble column need appear, there would not be heard so many wishes to have it removed as an obstruction. At present there is a divided interest, and the fortunate man who obtains possession of the picture would do well to persuade the artist to make two out of it, the architecture and bathers in one, and the charming English girls in Roman robes, who are comparable with the Fates of the Parthenon, in the second.

On the opposite side of the principal gallery is a small picture by Mr. Logsdail which suggests the advantage of making it plain that architecture, when elaborate, should be allowed supremacy. The *Venetian Interior in the Eighteenth Century* has two grand dames in conversation and a black page waiting at a distance. But they are treated as if intended to be only suggestive of scale. They do not interfere with our enjoyment of the beauty of a room which, if belonging to the declining period of Venice, reveals that the love of splendour was not extinct. Mr. Frank Topham is as much at home amid Italian buildings as his father was in Connaught cabins. In the *Acquittal* we see a young revolutionist who has come out of the gate of a tribunal embracing his sweetheart, while his friends telegraph the news in the old-fashioned way by signs and shouts. The gate could not be more elaborately drawn in its detail by a travelling student, but no more of it is shown than is absolutely required to suggest what has taken place. The artist is not quite so fortunate with the part of the temple introduced in *Nunc Dimittis*. There is no painter who employs architecture with more effect than Mr. Albert Goodwin, and he makes less pretension to figure-painting than did Claude, who was supposed to give his figures away as worthless. To say he is the successor of John Martin will probably be considered as faint praise, but that artist was inspired by grandiose ideas which he did not acquire in any school. In Bunyan's vision of *The S of Mansoul* there were likely to be fewer immense a and less resplendent palaces than Mr. Goodwin revealed to us, but the description and the realis reveal aspirations in common. Both men were drea The *Indian Afterglow: Agra*, is suggestive of soil th near to the internal fire, and the monotony is only br by the descent of a troop of crows. In such a place domes and minarets of the Taj Mahal stand out as s thing more than earthly, and the white marble wit delicate inlaying becomes a vision.

In the *Baile de los seises*, or choristers' dance, in S Cathedral, we have an admirable example of proporti treatment. The building, we need not say, is one of which make it difficult to know where to begin wi representation and where to end. The mere statisti the size, weight and number of interesting objects t found in the interior are amazing. Señor Gonzalo B introduces us within the choir or coro, which in Sp buildings is nearer the centre of the church than is us England and France. We see the great altar, its furn and surroundings, that are on a scale which becom vast a building, and the reja or wrought screen sepa the enclosure from the body of the cathedral. But al details are subordinate to the dance of the boys, wh clad in pink satin doublets with plumed hats. The have a family likeness, and the youngsters appear seeking admiration without much concern for the ant of the ceremony. The dance is the most novel subje the exhibition, but it would deserve its position on ac of the skill shown in the technique.

It is exceptional to have three painters undertakin same subject. Mr. Gow, Mr. John Charlton, and S D'Amato have depicted the *Diamond Jubilee Serv* 1897. The Academician and the Italian artist have their position in front of St. Paul's, and the western p the cathedral becomes the architectural background. represent the moment when prayer was offered b Archbishop of Canterbury. The two pictures corres with the photographic representations of the scene. Charlton selected a point of view more to the south in consequence buildings have to be introduced whic of no pictorial importance, unless as suggesting the ar ments made for sightseers. The three artists have equally laborious and truthful in dealing with the hur of figures congregated on the steps, but as the scen novel and unusually brilliant it is no wonder the pi are considered to be too glaring. Scarlet uniform ladies' summer dresses when seen on a bright day i cannot be subdued, unless the historical value of the sentation is to be ignored, and the three artists shou commended for their courage.

There are many other pictures in which the arc tural element should be considered. In Mr. V King's excellent *Path by the Mill* the long ran brick buildings appears to be taken from reality, a that aid an almost novel character is imparted picture, for the artist generally restricts his pencil to Mr. Leslie's old-fashioned bridge was an architect's for, as it is "hallowed by six centuries of great usefu work of the kind in those days would be entrust church builders. It is well adapted to the peculi peaceful air which surrounds his later pictures: b hope his next structure will appear under another li morning or a night scene would be no less interesting

The majority of visitors will not give much atten the builder's work which is introduced in the pi Architecture must succumb to whatever is dramat such a scene as Charles II. on his knees begging f ness from Lady Castlemaine, and ready to receive on the ear if necessary, which Mr. Frith contribute we fear, receive more attention than the *Baths of Ca* which is opposite. The battle scenes, although th not equal to some of those seen in former exhibitio be likely to receive extraordinary attention becaus show figures in action. Mr. Napier Hemy is usual tent to represent the courage of fishermen along the but his foresight compelled him to paint a smuggling showing a party of freetraders pursued by a revenu and firing from an old-fashioned cannon on the gu of the excise. It is animated enough, and visitors a

speculate about the issues of the race. Joan of Arc in the panoply of war has been revived by Mr. F. Roe. . Blair Leighton shows King Arthur, his queen and ghts at the water gate of the palace, gazing on the barge—

> Whereon the lily maid of Astolat
> Lay smiling, like a star in blackest night.

Many a painter must have wished he had retained the tures of moving accidents by flood and field which a years ago were little prized, but would now be welcomed masterpieces. If, for instance, Mr. Collier could stitute one of his costume pieces for *The Garden of mida*—a young gentleman in evening dress amidst venal uties—it might become the picture of the year. That inction, on account of the scarcity of dramatic works, ms destined to be attained by Mr. Byam Shaw's *Love Conqueror*. It is as brilliantly coloured as an Italian *one*, and the subject is a fantastic combination of gedy and farce. The god is mounted on a charger and els in the long line of his prisoners, who march to death ore him. Under the charge of amorini who enjoy the iation, Helen of Troy, Dante, Cleopatra, Mary een of Scots and other familiar beings appear among captives. In his desire to satisfy all, the painter has hesitated to employ the most popular portraits, and the ngement does not impart dignity to his picture. chel Angelo is seen in profile; Beethoven is the with the closed mouth we see in the common litho- hs. The Knight of the Swan might have stepped off stage. The familiarity will be appreciated by visitors he Academy. But where are Abelard and Heloise? chel Angelo has hardly any claim to appear in such mpany, for his admiration of the Medicean princess is ertain, and the affection for Vittoria Colonna was only onic. Raphael was an undoubted victim, but we e not recognised him. At another time the picture ht be lightly treated, but this year all the visitors will ise that the artist has conferred a favour on them, and nust recognise the care which was taken in the production nany figures. Another picture which at any time would ive attention is Mr. Solomon's *Laus Deo*. It is like llustration of Spenser. The young knight has passed ly through the enchanted wood, where brave men are dallying with Circes. He is riding across the river, a substantial angel holds his helmet while the young ior utters his thanksgiving. Mr. Solomon has never luced a better example of modelling and colouring. was not known as a Mediævalist, but in this work he surpassed his classical exercises. The armour, which ars to be slightly rusted, is manipulated with a success few living artists could rival. It should be considered e most satisfactory work in the exhibition.

Shakespeare has afforded few subjects of late, and year necessity has compelled several painters to e him. Mr. Abbey, by his scenes from "Richard III." "King Lear," proved himself to be an original inter- r. This year he has adopted the hazardous experi- t of illustrating two of the songs rather than scenes any of the plays. He has not had in consequence the ntages which arise from painting figures with whom le are more or less acquainted. The experiment is con- ently most risky. *Who is Sylvia? What is she, that all wains commend her?* shows us a lady very richly clad mpanied by young gentlemen who are proud to be her nts. In his second picture—*O, mistress mine! where you roaming?*—we see a lady who appears demented. s placed beside a standing stone that would have served r for a girl in Druidic costume. The song is Italian, he costumes alone belong to that country. Neither re appears to be completely finished, but both are nce of the success which Mr. Abbey can obtain by le methods. We can suppose a connection between ong and the figures, but if the titles were not supplied dy could guess the subject of each picture.

There are several figure pieces which, if not exciting or erious, are still interesting. One is Mr. Shannon's *s in the Wood*. It is in the French tapestry style, and s two peasant children wandering in a wood. Mr. C. Horsley's *Arbitration* is a dispute between two s in a harem, which is left to the judgment of an dant. Mr. La Thangue has some of his Sussex peasants, which are cold in colour; but to *Cider Apples* he imparts more warmth than he has yet exhibited. Mr. Herbert Draper's *Trailing Clouds of Glory* is not tragic like his *Icarus* of last year, for it represents a fisherman's child in one of those Belgian churches where they admit models of boats as memorials of gratitude. She stands against a column, and her face is illuminated by light from an invisible window. *Favourites of the Hunt*, a lady with a horse and dogs, by Mr. Macbeth, is as charming as a French cabinet picture of the last century. In *Perseus and Andromeda* Mr. Nowell attempts depicting the legend in an original fashion. The victim is not tightly bound to the rock, but carries a chain which allows freedom of motion within a limited distance. The sea monster is not more terrible than the majority of its class. Mr. Clausen has two pictures—*Allotment Gardens* and *Going to Work*—which are in the style associated with his name. Picture-buyers, we suppose, do not wish that he should go outside the familiar groove. Mr. Louis Feldman has introduced a French practice of painting scriptural scenes with the figures in western costumes. In his *Widow of Nain*, Christ appears accompanied by Dutch folk clad in costumes which were worn at a late period. In the *White Cockade* Mr. Lockhart has painted a familiar incident of a lady fastening the Jacobite symbol in her lover's bonnet, regardless of the consequences to him.

ARCHITECTURE AT THE ROYAL ACADEMY.—II.

At one time it was commonly supposed that the days for building cathedrals were over, but when Truro began to rise there was end to the despondency. The erection of an "Archiepiscopal Palace, Canterbury," appeared a less likely event, for cathedrals appeal to a larger number. The new conditions of episcopacy have made such a building necessary, and negotiations have advanced so far as to make a bird's-eye view possible. Mr. W. D. Caröe's houses are generally of the eighteenth century, but in this case he has wisely gone back a few centuries, and in one sketch we can see how well his lines will agree with those of the great Angel Tower. The new buildings will form a group which will be adapted for the tenant, being sufficiently dignified and capable of permitting hospitality on a generous scale, while suggesting that economy has to be considered. Although the palace would be taken as a Gothic building, and if more money were at disposal there would be more signs of the exuberance belonging to the style, yet it is quiet compared to the new Classic of which the "Entrance to Assize Courts, New Law Courts, Cardiff," is a characteristic example. In it we see the fear of long lines and plain surfaces. The inscription on the frieze, "Deo adjuvante, non timendum," has to be divided to allow of the introduction of an armorial shield. The cornice prematurely ends to find space for sculptured figures. Everywhere there are signs of an endeavour to avoid monotony and to seek novelty. It will perhaps be said that Classic or Italian correctness is ignored, but Horace Jones's old courthouse is an example of that quality, and few will say it is preferable to the building which Messrs. Lanchester, Stewart & Rickards have designed. The older Classic is more apparent in the "Design for Memorial Buildings, Singapore," by Messrs. Ashley & Armstrong, and it is curious how fond the authorities appear to be of the style, as if it were impolitic to attempt an adaptation of any local style, because in that way the weakness of the rulers would be revealed. A design for a town hall by Mr. Pawley is of the familiar type—a long range of windows and a high tower. Mr. Lewis Ambler shows a house at Biddenham, Mr. W. T. Walker one at Southgate, Mr. W. A. Pite stables at Highcombe Edge, Hindhead, and also a timber staircase in the house, which is lighted by an œil-de-bœuf; and Messrs. Dawber & Whitwell a "Village Post Office, Broadway, Worcestershire," which is not according to the official pattern. In Birmingham for a long period there was practically an official pattern for schools, because one firm monopolised all the commissions, but the "New Higher Grade School, Deaf School and Pupil Teachers' Centre, Aston," by Messrs. Crouch & Butler, proves the advantage of

allowing several architects to take part in the work. There is no plan to explain the arrangements, but the principal building exhibits very large windows with pilasters between, and there are much smaller buildings at the sides. A mean has been realised between a college and a school without any of the depressing elements which are too common in the Board schools of provincial towns. Messrs. Brewill & Baily's "Presbyterian Church, Nottingham," is free from symbols or ornament that might offend, the tower for that reason apparently is without a spire, but as the battlemented top is arranged as curves, a sky-line that is pleasing is secured. A fine "Clock Tower and Campanile for St. Michael's College, Tenbury," comes from Messrs. Mallows & Grocock; the upper part, we suppose, can be used occasionally by some lone watcher of the skies. The "Clock Tower, Fyvie Castle," by Mr. A. M. Mackenzie, of Aberdeen, is a turret rather than a tower; it is Scottish in style, and is treated to admit of the arms of the owner underneath. Mr. E. P. Warren introduces a sturdy tower as part of his small "Church of St. Martin, Bryanston, Dorset," and around the upper part are several armorial shields; if colours are used for the bearings, for form alone is insufficient, the effect will be pleasing. Mr. Horsley's "Stables, Whitley Hall, Yorkshire," form three sides of a square, and are approached by a very large gateway. The "Four small Country Houses in Southbourne-on-Sea," by Mr. G. A. Bligh Livesay, have variety, and are adapted to the position and use, but the drawing does not do justice to the design. The "Design for a Concert Hall," by Mr. W. S. Bates, from the severe style would appear to be intended for any purpose rather than musical performances, unless restricted to requiems and funeral marches. The "Music-room, Cotlands, Sidmouth," by Mr. R. W. Sampson, is not open to an objection on account of heaviness, and the painted decorations are not out of keeping with the purpose of the erection.

The most important design in this part of the room is Mr. Aston Webb's "Britannia Royal Naval College, Dartmouth." The building stands on a terrace, and the curved lines of the approaches are advantageous as giving contrast with the long line of buildings. There are three floors. The rooms must be all well lighted, for the space between the windows is very narrow, and in the central part serves for thin slips of pilasters. There is some difference in the windows, and as a whole the building appears to have less sameness than is customary with barracks. Near it on the walls are several drawings of houses of various sizes by Messrs. Dawber & Whitwell, Mr. H. C. Clarke, Mr. F. Glennie, Mr. W. Millard, Mr. G. Hornblower, Messrs. Wilson & Talbot, Mr. H. O. Cresswell, Mr. W. R. Jaggard, Mr. J. A. Brand and Mr. H. G. Ibberson. Messrs. Harrington & Leys's "Design for Cardiff New Town Hall" recalls St. Paul's Cathedral by its dome and campaniles. Mr. Caröe's "Reredos, St. David's, Exeter," is Germanic in arrangement of curved lines, and his "Tower, St. Mary Yate, Gloucester," will bear comparison with older examples. Mr. C. H. Fowler's "Chancel, &c., St. Mary's, Oldham," is free from a screen, and a fine window is introduced at end. There are three designs for the "States Hall and Court House, Guernsey." The site is inclined. Messrs. Gotch & Saunders show a plain building with a few very large windows, and curved lines are avoided. The tower is more suggestive of a public building, and is hardly in keeping with the remainder. In Mr. R. F. Atkinson's design, the entrance, with the tower over it, is a fine example of composition in which curved lines are freely used, but the two ranges of heavily rusticated windows seen in the side view are more suggestive of a series of rooms than of a place of assembly. More courage in the expression of use would have been beneficial, although symmetry might suffer. In Mr. Mountford's design there is greater independence, but the domed salle d'attente would satisfy a stickler for precedents. The "Proposed Fire Brigade Station, Bootle," by Messrs. Briggs & Wolstenholme, might well be made to serve as a town hall, and is gratifying as evidence of the public spirit displayed in many of the provincial towns. The difficulty in such buildings is making provision for fire-escapes, and it is not evident from the drawing exhibited. Mr. Hack's "Design for Technical Schools, Sutherland," shows the entrance, that is flanked by rusticated columns, which in the view appear h
The "Newport and Monmouthshire Hospital," by Richard J. Lovell, is the most important building c
class seen this year. It consists of a centre block an
wings with buildings connecting them. As the ar
ample there is no necessity for entrances which have t
reached by ascending several steps, and inconvenien
patients is avoided. The building has a cheerful ap
ance, although it cannot be said much money was expe
on decoration. Mr. Grocock's "Alternative Desig
the Tower of St. Andrew's Church, Bedford," s
skill, and, from the position of the structure, it
appear as if guarding an entrance to a garden.
C. S. Blomfield has an effective house at Abing
Mr. Huntley Gordon a large block of City o
"Abchurch House, Cannon Street"; and Mr. C.
Quennell an "Entrance to House," the last being s
enough as an architectural work, but not easily overl
on account of the novel drawing, which sets importan
the shrubs of a suburban forecourt. Several desig
stained-glass are next encountered.

The "South Hall of Branksea Castle, Dorsetshire,

evidence to prove the inadequacy of a 5 per cent. comm
The detail of main façade gives a surprising amo
variety in brick, stone, iron and marble. In the
chamber a frieze is introduced above the mayor's
which shows a carefully composed interview betwe
Romans and Britons, which is definite enough
followed by a painter. The "New Premises, H
Square," by the same architect, represents a stately

in which sculpture is skilfully introduced above the first-floor windows. The view in the cloister of All Saints Convent, St. Albans, by Messrs. Stokes & Hine, shows three sides of a square, the cloister arches being closed in. Painting will be extensively used in Holy Trinity Church, Roehampton, designed by Mr. Fellowes Prynne. There is a florid frieze over the arching; the screen does not interfere with the prospect. The proportions are satisfactory, and altogether the church deserves commendation.

The "Altrincham Council Offices," by Mr. H. Goldsmith, is of the two-storey cottage type, with only one entrance. The design for the Board school at Littlehampton, by Mr. W. Gillam, presents an unpretentious group, the central part in which is the board-room, rising a little above the sides. Another instance of the employment of a dome is seen in the design for the Port Elizabeth Library, by Mr. Selby. Mr. A. Williams's "54 Parliament Street" is presumably a bank, and the heavy quoins to the windows may therefore be intended to suggest strength. On one side a turret is introduced, and is a gain to the composition. "The Heights, Witley," by Mr. Paxton Watson, could with as much reason be called "The Gables," for there is one over each window. Plainness has been sought after. The design for the Hull public library, by Mr. H. J. Buckland, appears as a two-storey building, the lower windows being arched. The remarkable group of St. George's Church Schools, Mayfair, which are superior to the majority of London Board schools, would appear to more advantage if a better drawing were obtained. Mr. P. A. Robson was the architect. Mr. Champneys's "New Buildings, New College, Oxford," are shown by an elevation, and are in keeping with the general collegiate type of Oxford. Mr. Spooner's "Chancel of St. Michael and All Angels, Little Ilford," is remarkable for the introduction of two angels, one bearing a sword, as guardians of the sanctuary. Next we meet with a country house by Mr. J. Cash, another by Mr. P. J. Marvin, a fine hall with galleries across at Emley Park, Hants, by Mr. H. O. Cresswell; and a large hall with a timber roof wainscotted in Holyrood Schools, Swindon, by Messrs. Silcock & Reay.

"The Lady Chapel, Holy Trinity Church, Chelsea," is shown on a remarkable drawing by Mr. H. Wilson. So much appears mysterious, it does not seem possible that the project can ever be realised. The most prominent object is a sculptured column, which appears to be hung round with shields, and introduces an idea of romance which would be more in keeping with a baronial chapel. In the frieze for the P. and O. board-room Mr. Frank Murray makes good use of ancient boats which could not be distinguished for their swiftness. In the staircase and gallery of Kelly House Mr. W. Leiper, R.S.A., of Glasgow, reveals his power in colour and in treating woodwork. We have a country house and a hall by Mr. G. O. Scorer, and a good example of a London manufactory, with the utmost window space, by Messrs. Roumieu & Aitchison. "The Bridge Lodge and Gates, North Mymms," by Messrs. Ernest George & Yeates, would not satisfy a modern engineer, for a pier is found in the middle of the river, but we suppose there can never be much force in the water. The form is old-fashioned, with recesses on the roadway over the piers, but it is undoubtedly picturesque, and in combination with the lodge and gates forms an artistic composition. There is refinement in Messrs. Wimperis & East's "Business Premises, George Street, Hanover Square;" the lower part is a shop, and the owner has allowed a portion of the window to be obscured for the sake of effect. There is a balcony on the second floor which, with some other features, gives a Parisian character to the building. Mr. J. S. Lee's "Design for a Garden by the River" is in the Italian style, from the architectural character in the terraces and other elements, but there is no means of knowing where the vegetation is to be found.

Mr. Archibald Paul Brevitt, architect, of Wolverhampton, and brother of the town clerk of the borough, died on Tuesday. He was fifty-nine years of age, and had been in ill-health for a considerable period. He served his articles with Mr. Taubshaw, of Stafford, and commenced practice at his native place, Darlaston, removing about fifteen years ago to Wolverhampton.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, W., Mr. G. H. Fellowes-Prynne, president, in the chair.

A unanimous vote of thanks was passed to Messrs. G. B. Carvill, G. Bailey, and Leonard Butler, for their services in preparing words and music, and the performers who had assisted in the production of the "Druids' Elect" on the occasion of the Association's annual soirée.

A second vote of thanks was passed to the Prime Warden of the Fishmongers' Company for allowing members to visit Fishmongers' Hall on April 15, and also to Messrs. H. Chatfeild Clarke and J. D. Crace, who conducted the party over the hall.

Owing to the unavoidable absence of Mr. F. W. Macey, his paper was read by Mr. G. B. Carvill (hon. sec.).

Specifications.

There has been so much recently written upon the subject of specifications, that it is difficult to suggest any new or original ideas, and I fear that the few remarks I have to make may be somewhat wearisome to many present, and seem like going over old ground. But those who have not given the subject any special consideration may find some of the suggestions not wholly unprofitable. And if further excuse is necessary, I do think that to hear a question discussed creates a more lasting impression than that of mere reading.

A specification may be either lengthy or curtailed, according to the particulars given upon the drawings. Some engineers favour a short specification and prefer to put as much written information as possible upon the drawings, one reason for this being that engineers usually supply a number of detail drawings with their contract plans, which enables them to put many notes upon those drawings. On the other hand, architects do not usually supply many detail drawings, consequently somewhat lengthy specifications are necessary. To my mind, either method may be adopted if the requisite information be clearly given.

I can conceive of a set of plans prepared and written up so fully in detail that a specification as a separate document might become unnecessary; this sometimes happens in a certain class of work. On the other hand, I can scarcely imagine a specification so full in detail as to dispense altogether with the plans, unless it related to a very small and simple erection or to general repairs or decorations.

But without further discussing these two methods I would ask you to assume that both plans and the specification are necessary for general work; I will then suggest a form of specification which shall be curtailed and yet shall not detract from a full and clear description of all parts of the work.

A specification should not supersede the particulars given upon the drawings, but should more fully explain those parts which the drawings do not clearly illustrate, or which are in any way obscure. It is impossible to show every detail or give every particular upon the drawings, consequently a full description of those parts becomes absolutely essential in the specification.

I take it that the plans give the general arrangement of the building, and the specification should describe the details of that arrangement. The plans should have figured upon them every important dimension, such as the lengths, widths and heights of the various distinct parts of the building; the thickness of walls, the depth and width of the concrete foundations, the sizes of floor joists, roof and flat timbers, the widths, and heights of doors and windows, and all other similar and important parts and items. It is seldom that plans to a small scale are so accurately drawn as not sometimes to be obscure with regard to the sizes of certain parts unless these parts are given in figures.

The only other particulars in writing to be put on the plans would be the names of the rooms and other parts of the building, together with any notes or references which might assist the description in the specification.

With regard to small scale drawings, do not labour the elevations by showing every brick and slate. Working drawings will be far clearer without too many lines, and there is no need to finish them like a picture. But in the specification I would include everything except the general dimensions of the various parts of the building. Of course the sizes of the joists and roof-timbers are always described in the specification, as well as sometimes being given on the plans; and I see no harm in stating the thickness of the various walls, the depth and width of the concrete under the walls, or any other detail of the building. A specification which is full, but at the same time concise and to the point, will prevent mistakes and misunderstandings when the building is in progress. Need I remark that the specification should always agree with the drawings?

Presuming, then, that the plans are before you, but not in too great detail, and that you have decided to write a rather full specification—what, then, is the first consideration?

You must have a complete knowledge of your subject, that is, a full grasp of the details of building construction and of the value and properties of materials. In other words, you must know what you want to describe, and, knowing that, you must be acquainted with the requirements attendant upon those wants, and you may take it for granted that until you are proficient in these matters you will never be able to commit to writing the proper descriptions needful to the erection of a building. Therefore, I say that a complete knowledge of all the requirements and details of the various trades coming within the scope of the architectural profession is the first consideration to efficient specification writing, and I might also add a knowledge of the various Acts relating to buildings. But it may be said that it is impossible to know everything, and when in doubt the only way is to put a provisional amount to cover any such point, and to obtain afterwards the information from a friend or specialist. This is true, and may be the only course to adopt at the time, but ready and accurate knowledge will benefit all parties concerned.

The question then arises, What is the best way to obtain such knowledge?

I know of only two ways—study and observation. What I do myself is first to read any works obtainable which bear upon any doubtful point, and I would also add that much useful information can sometimes be gained from trade catalogues. I then discuss the matter on every possible occasion with anyone I come across who has any knowledge of the subject, and, further, I keep my eyes open and learn all I can from what is going on around me. You have only to pass down any street where building operations are in progress to gain many practical hints.

You now proceed to write the draft specification. This is often hurriedly written, much being left to alter and supplement when revising for fair copying. This is a great mistake. A draft specification should be written with care and thought. Being fresh to the matter, even so dry a subject creates a certain amount of interest, and if you concentrate your mind upon the subject you will be less liable to omit many small items. Therefore, let the first draft be as complete as possible.

I might suggest that when engaged upon the plans, it will be found of great assistance if notes are made of any obscure item coming under your observation at that time.

Just a reminder here. When sending out a number of fair copies see that they all agree.

There is one matter which I should perhaps have referred to sooner. Should the quantity surveyor write the specification for the architect? In the abstract it seems absurd to ask such a question were not this practice so frequently followed. Personally, I think the architect should write his own specification, and not delegate the work to another. A quantity surveyor cannot know what is in the architect's mind, therefore it is impossible for him to describe fairly that which embodies the architect's best ideas. It is unjust to the quantity surveyor to ask him to attempt to do so. It is also unjust to the client, and the architect has no right to accept payment for work done by another. One other word with reference to the quantity surveyor.

When he takes out the quantities it is usual for him to make notes of any omitted items on the architect's specification. Should he not do so, however, the architect must run through the bills of quantities and adjust the specification to them before the contract is signed.

Reverting to the subject-matter, a full specification will save many an anxious moment. Constant disputes occur with the builder, many extras crop up owing to imperfect wording and omissions—ordinary care would prevent all this. And remember always that a specification is a legal document.

Bearing somewhat on this incomplete description of work, attention might be called to the fact that one so often sees in a specification wording to this effect:—"That the builder is required to perform a certain work all complete," or "all as required," or "as necessary." This generalising shows the architect's ignorance of what is required, and it is not reasonable to ask a man to estimate for something of which you yourself do not know the requirements. Consequently you either get an unfair estimate or an incomplete work, or else a squabble ensues with the builder as to what was intended or required. Should you ever be in this difficulty of not knowing what is necessary, then the best plan is to put a provisional amount and let the item work itself out in execution. Therefore let your terms be definite and clear. Some make a great point as to which is the correct word to use, "provide" or "supply." I think it very unimportant. There certainly is a slight difference; but, at the same time, to provide you must supply, and to supply you must provide.

Agreeing, then, upon this point that a specification must be somewhat full, and consequently lengthy, what then is the best way to curtail the descriptions without detracting from the merits of the document. There are several ways. Many items which will apply to several parts of the building under similar conditions may be generalised. Thus take, for example, the skirtings to a building. A general clause applicable to all skirtings may be inserted, somewhat to this effect:—All skirtings to be rebated to floors, tongued and mitred at angles, tongued at heading joints, housed into architraves, returned and mitred at ends, and fixed to double splayed narrow-framed grounds with dovetailed backings and filling out blocks, and plugged to walls.

The only further description then necessary will be to refer to each particular skirting, such as—Attic skirtings, 7 in. by 1 in. plain deal; first-floor skirtings, 9 in. by 1¼ in. moulded deal; and so on.

Here, then, the description of the fixings to each separate class of skirtings is avoided. In the same way the backings to door and window linings, and many other items where the conditions are similar, may be generalised. Further, if any detail drawings are supplied with the contract plans, which I fear is not often the case, a specification may be much shortened without detracting from its efficiency by merely referring to the detail drawings in question, and at the same time mentioning any particular feature not readily gathered from those drawings. Thus in about three lines may be stated all that is necessary, which otherwise would perhaps occupy a dozen or twenty. But I fear, until it is the custom to supply detail drawings with the contract plans, very much cannot be made of this point.

Here is another way to shorten a specification. Take, for example, the windows to a building, one or two of which are dissimilar from the rest. I would first describe those and then refer to all the others on all floors, in all positions, in the one item, and not describe them to each floor separately. Take, again, the external facings to brickwork. Describe any special facing first, and then the whole of the other facings to all parts in the one item without reference to special position. There are many other items which may be treated in this manner. One more suggestion. The wording itself of a specification may be much curtailed by care and practice. You will never be able to write concisely and to the point until you have written many specifications. Do not labour the wording needlessly nor repeat yourself unnecessarily. In time the requisite language will come simply and quickly.

I want it to be understood that my remarks chiefly apply to the correct form and wording of a specification of which quantities do not form a part of the contract, or which, perhaps, have not even been supplied.

Another important point in a specification is that it should be readily understood and clear. To avoid confusion tabulate as much as possible the various parts of a complete item of work by placing each separate particular under the preceding one. It will take more paper, but then that is always a good fault, for it will make the description clear at a glance. The form of tabulation I would suggest is as follows, which illustrates the description of a roof formed with trusses.

The roof to be formed of, say, six whole trusses and two half trusses, each to be placed 10 feet apart, and composed of the following scantlings, and the whole notched, framed, spiked and strapped together:—

Tie beams 12 inches by 6 inches, resting on 2 feet 6 inches by 12 inches by 3 inches tooled York templates.

King posts out of 6 inches by 5 inches,
Principal rafters 6 inches by 4 inches,
Struts . . . 4½ inches by 4 inches,

and so on. Here it will be noticed that each separate component part of the roof is placed immediately under the preceding one until all the items have been described. Thus, at a moment, the sizes and particulars of any one special part of the roof may be seen.

This form of tabulation will be found much clearer than the method which is so often adopted of running on the particulars of the various items line after line without a break. In the same way may be tabulated the descriptions of floors, windows, doors, and many other distinct items severally composed of many parts.

As another aid to the clearness of a specification, divide the descriptions into many clauses, and do not make the clauses too long, nor omit an occasional full stop. Also keep the clauses well apart, and do not crowd them together; any item will then be quickly seen, and you will not have to question to which part of the building a description belongs.

Conceding this point that a specification should be perfectly clear at a glance, a further question arises, Should the work be divided into separate trade headings? As a general principle this is unavoidable, and I think desirable, but I would also say without hesitation that very many distinct items of work would be clearer and more comprehensible if the various trades relating to them were not separated, but the complete item of work described under the one heading, placed in whichever part of the specification seemed most desirable. Thus, to illustrate:—

Take an iron casement window, with wood frame, lining and the usual glass and fittings. Ordinarily this would come under several trades, but I would describe everything connected with that window under the one heading of, say, joiner—that is, the

iron casement, the wood frame, linings, shutters and finishings, he ironmongery and glass, and with perhaps a cross reference n smith, stating that the iron casements are described in joiner. The builder will see at a glance all the requirements of that window, and the client, if he peruse the specification, will also have an idea how it will look when finished. Another example. Take an iron girder. I would describe under smith and founder the girder itself, the templates, cover stone, any cement packing, felt or lead seating and the painting. Perhaps it might be better to generalise the painting under painter in the one description applicable to all girders and covered up ironwork, and in that case a reference should be put under smith and founder. There will then be no excuse for the painting to this work escaping the builder's attention.

When describing the work to small alterations, repairs, or decorations, it is almost essential to adopt this order of running on the description, regardless of trade headings and formalities. Of course, when work is let to separate tradesmen you cannot adopt this method.

A building contract, which is often referred to in a general way as the specification, is understood to include the conditions of contract, the form of contract—that is, the actual agreement, and the specification of the subject-matter embraced in the contract. The conditions of contract and the form of contract should only embody, so to speak, the actual legal requirements which, taken by themselves, do not affect the description and value of the work and materials. These strictly legal clauses I do not propose to touch upon.

But it will often be found in many specifications that under the leading conditions of contract are placed many clauses which do actually affect the amount of the estimate. This, I think, is a mistake, for at the time of tendering, a builder so often only hurriedly scans the conditions of contract, and when reading them over again, preparatory to signing the contract, may, unfortunately, find there are several items included which he has omitted to price in his estimate. The client does not always see his point, and the builder either has to bear the loss or throw up the work. This remark chiefly applies to a work for which no bills of quantities have been prepared.

But that part of the contract, or, in other words, the specification itself, of the actual work and material, should embody every item which may in any way affect the estimate; therefore, under the General Clauses, or Preliminary Items, as they are often called, I would include the following matters, which are so often to be found only under the Conditions of Contract:—

The date of completion—this requirement may necessitate an extra allowance for overtime or other special employment of labour; the mode of payment—under certain conditions the builder may require to borrow money to enable him to carry on the work between the times allotted for payment; keeping the work in repair for a stated period after completion—this may necessitate an allowance to cover any matter which may crop up under this item; the insurance fees and fees to any authority should also be included under this heading of preliminary items, as also any other matter not coming under a trade heading which may possibly require a price.

Just a hint as to the outside cover of a specification. Put as a reminder in red ink a note of the insurance and date of completion. One is apt to forget these matters.

Then as to the marginal references. It will be found a great convenience to all parties if a marginal note is given to each distinct item of work. It will then be seen at a glance where a "bath casing" is placed or the "spandril framing to a staircase," instead of having to wade through pages of other subject-matter. In addition to the marginal notes, I would put all the principal items under sub-headings, so to speak, in their respective trades; such as all wood staircases under a sub-heading of "Staircases" in carpenter and joiner; similarly, all casement windows under a sub-heading of "Casement Windows," and all other such divisions of work. And when you come to the many minor items which only require a separate clause to each, these might be put under the one sub-heading "Other Items" or "Other Fittings." These sub-headings should be written across the page.

As to numbering the clauses. This I think very important. It will be found of great assistance to be able to refer to the number of a clause in a letter when calling the builder's attention to any special part of the work, as also in the case of cross-references when referring from one part of the specification to another. Each separate clause need not necessarily be numbered, but only each distinct item of work, which may embrace several clauses.

As to marginal sketches to illustrate rather involved parts of the specification, I think in many cases these will be found very useful. I would then suggest that the lithographer take them direct from the architect's sketches. If the specification is typewritten or fair copied in the office, then either do all the sketches yourself or else see for yourself that they are copied correctly.

(*To be concluded.*)

NATIONAL PORTRAIT GALLERY.

THE Trustees of the National Portrait Gallery have received under the will of the late Colonel John Barrow, F.R.S., formerly of the Admiralty, a bequest of a series of portraits painted for Colonel Barrow by Mr. Stephen Pearce, relating to the various expeditions in search of Sir John Franklin.

The portraits comprise a large portrait-group representing "The Arctic Council discussing a plan of search for Sir John Franklin," four large half-length portraits representing Sir Robert McClure, Sir Leopold McClintock, Captain Penny and Sir George Nares, each in the dress worn by him in the Arctic regions; fifteen small portraits of Sir Richard Collinson, Sir Henry Kellett, Sir Edward Belcher, Sir Edward Inglefield, Dr. John Rae, Captain Rochfort-Maguire, Captain J. E. Moore, Dr. Robert McCormick, Lieutenant J. Stewart, Lieutenant Bellot, Sir Horatio T. Austin, Admiral Sherard Osborn, Dr. William Kennedy, Sir Leopold McClintock and Sir Erasmus Ommanney.

In accordance with a decision of the Trustees made with reference to a similar collection of Arctic portraits bequeathed by Lady Franklin in 1892, this collection will be treated as a group or series of portraits either comprised in one picture or combined for one common object.

As, however, in the present state of the Gallery, it is no longer possible to find room for so large an accession of portraits requiring to be hung together, a room in the east wing adjoining the National Gallery will be adapted for the purpose of containing the Arctic portraits bequeathed both by Lady Franklin and Colonel Barrow, to which access will be made through the galleries in the east wing.

The Trustees have also purchased from the widow of the late well-known sculptor George G. Adams a marble bust of Sir William Napier, the historian, and plaster models of Sir Charles Napier, Rajah Sir James Brooke, His Royal Highness the Prince Consort, Lord Clyde, Viscount Gough, Lord Seaton, Lord Brougham, Viscount Palmerston, Sir Henry Havelock, Archbishop Sumner and a portrait in relief of Field-Marshal Viscount Hardinge.

The Trustees have also purchased the following portraits:—William Croft, Mus.Doc., attributed to Jonathan Richardson; William Drummond of Hawthornden, a small panel portrait attributed to G. Jamesone; George Morland, drawn by himself in tinted chalks, and presented to his pupil Elias Childe; and the following gifts have been accepted by the Trustees:—William Eden Nesfield, the eminent architect, drawn in Rome by his friend Jacob E. E. Brandon, presented by Mr. John Hebb, F.R.I.B.A.; John Varley, the water-colour painter, a pencil drawing by his friend William Blake, presented by Mr. Godfrey E. P. Arkwright.

AN OLD FORT AT HILSEA.

AN old fort overlooking Langstone Harbour, and situated under the railway line at Hilsea, about a mile from Portsmouth, has been accidentally unearthed. An inspector of the permanent way in the employ of the London and South-Western Railway Company, when walking on the lines, noticed a subsidence of the embankment. He at once had the side of the permanent way opened, and then found, two feet below the surface, the roof of a disused old fort. Subsequent search has disclosed the fact that not only did this fort cover an area of 60 feet under the railway, but that it was one of a series of fortifications some 200 yards in length. The corridors and embrasures are fairly intact, but in some instances the supporting piers are split and the caps are in a crumbling condition. It has also been ascertained that, except where the railway subsided, the roof is of great strength and well groined. Steps have been taken to shore up the subterranean buildings, and the War Office has been informed of the discovery. The railway line was laid down in 1847, and at that time the military authorities must have been acquainted with the existence of the buildings, but it was probably assumed that, owing to the substantial character of the structures, they could well bear the weight of passing trains. The fort stands at the north corner of Portsea Island, and is loopholed to command a view of the sea, a view, however, which has long since been closed by the extension of building in that direction. The subsidence is supposed to have been caused by the recent heavy rains, but as two feet of water was found in the fort it is probable that the depression has been going on imperceptibly for a considerable period.

A Blue-Book has just been issued showing the amount spent on technical education during the year 1896-97 by local authorities. The total amount expended in 1896-97 was 812,696*l.*, and the estimated total expenditure for 1897-98 was 848,829*l.* These amounts are exclusive of the sums allocated to intermediate and technical education under the Welsh Intermediate Education Act, 1889.

NOTES AND COMMENTS.

BUILDINGS are a kind of property of which any intelligent man can form an approximate valuation, and accordingly they are not of much account with company promoters. They may be introduced among other varieties of property in a prospectus, and in that way help in delusions, but by themselves they are risky elements by which to make out big dividends. It is plain, however, that people can be deceived by considering that buildings with which they are acquainted in some mysterious way can be made to yield extraordinary profits. A case of the kind has occurred in the city of Cork. It possessed a music-hall of a humble description. But it was good enough to inspire promoters with the happy thought of creating a limited company to possess the treasure. The prospectus was drawn up with great skill. Much was left to Celtic imagination. For example, the revenue hitherto derived from the hall was not stated, but the profits were given of music-halls in five large towns, with none of which Cork could be compared. It was also announced that the site was leased at a reasonable rent, and every reader of the prospectus could draw his own conclusion what that signified. The rent in reality was 420*l.* a year, which was an enormous sum for a building site with a public-house license attached in a place like Cork. However, the promoters received 6,500*l.* for their interest in the lease. The building was removed, and nearly 13,000*l.* was expended on its successor. The realities of the case were perceived when it was too late to avoid meddling with them. The only course left was to get rid of the incubus. Tenders were invited for the purchase of the building. Only one was received and the amount offered was almost nominal. The shareholders have therefore lost their money and are saddled with responsibility for a rent of 420*l.* The question now is, Can any means of redress be discovered? According to Mr. T. M. HEALY, Q.C., who is an acute lawyer, "If an action for deceit and misrepresentation is brought against the directors, the result will turn on the narrow issue as to the statement in the prospectus that the site had been leased at a reasonable rent." It will, of course, be very hard to obtain unanimity about the meaning of the expression "reasonable rent," for experts will be found to say Cork is a city with great powers of growth. But the whole case reveals what is possible when skilled advice is not taken about the value of a building as an investment.

THE defective sanitation of the Houses of Parliament must give rise to much amusement among foreigners, for it is apparently an enduring proof of the weakness of organising power in England. If BARRY had been allowed to have his own way his common sense would have devised arrangements for drainage and ventilation which would still be efficient. But he had to succumb to DAVID BOSWELL REID, and the results have been an enormous waste of money in undoing REID'S devices, much inconvenience to members, and an apprehension that the building is the most unsafe in Europe. Dr. PERCY, in trying to remedy the defects, sacrificed a great reputation. Not many years ago Professor CARNELLY ascertained that in the lower regions of the Houses of Parliament myriads of microbes had collected, and several thousands of pounds were expended in an endeavour to free the House from the enemy. Now it is proposed to pump in ozone and disinfect the House of Commons every night. The First Commissioner of Works stated on Tuesday that he had caused the plant necessary for the manufacture and introduction of ozone to be inspected. The methods and practical merits of the process do not appear to be as yet sufficiently established. The cost of a complete installation at the Houses of Parliament would be some thousands of pounds, and the electrical pressure required for working it is no less than 12,000 volts. We grant that the installation would be costly, but it is too late now to revoke. The authorities came to the conclusion there was no necessity to have an architect even temporarily engaged as adviser in connection with the Houses of Parliament. Since then they have had the gratification of trying one experiment after another, and the country has had the gratification of paying for failures. If we suppose the project will require as many thousands of pounds as there are to be volts, the sum will not appear excessive after the waste for which the Office of Works is accountable.

THE reason of the exhibition of the designs for the new Government buildings in Whitehall and Parliament Street was not definitely announced. It was supposed they were intended to elicit suggestions, and were not to be considered as more than careful sketches. But from the reply to a question on Tuesday by the First Commissioner of Works we may conclude that the buildings will correspond with the designs which received the approval of the Government before they were exhibited. Mr. AKERS DOUGLAS said:—"The plans were placed in the tea-room for the inspection and criticism of hon. members. Certain alterations in matters of detail have been suggested, and these suggestions will be carefully considered. Generally the plans have been most favourably received, and I shall proceed with the work without any unnecessary delay." If changes take place they will be simply in detail. The ingenious effort of Lord WEMYSS to utilise the occasion for realising INIGO JONES'S design for the Whitehall Palace, of which only a part, viz. the Banqueting House, was erected, did not meet with much favour from the First Commissioner. He said:—"I have carefully considered the sketch elevation prepared at the suggestion of Lord WEMYSS, and I regret that, although externally attractive as a design for a royal palace, it is unsuitable for Government offices. There would be no useful purpose served in placing this design in the tea-room, unless it is accompanied by a plan and sections showing the nature and arrangement of the accommodation it would provide." Lord WEMYSS, in common with the majority of amateurs, supposes that architectural designing mainly consists in making façades. There is no question of the beauty of INIGO JONES'S work, but he was not thinking of creating a Government office. We must also remember the Banqueting House did not form a part of a principal façade. It was a part that looked on an inner court, and the irrational arrangement of suggesting by the exterior that the building consisted of two storeys, while inside there was only one room, was due to the desire for corresponding with other parts of the court. Great as was INIGO JONES, his designs for special purposes are not universally applicable.

Among the foreign artists that appeared in this country about the time of the Restoration was JOHN VOSTERMAN, who painted a chimneypiece for CHARLES II., and a couple of views of Windsor. As he asked high prices, from 150*l.* to 200*l.* for a small picture, the King failed to patronise him. He lived in an expensive style, and not being able to pay his debts was arrested. In vain he implored CHARLES to grant him liberty, and he was retained until his countrymen subscribed the necessary sum. Afterwards he accompanied the English ambassador who was sent to Constantinople; but as Sir WILLIAM SOAMES died on the journey, the fate of the artist is not known. Like other foreign artists, VOSTERMAN went to Scotland in quest of patronage, and while there CHARLES II. commissioned him to paint a view of Stirling. The picture still exists, and was exhibited last week at a meeting of the Stirling Archæological Society. It was purchased at a sale in Edinburgh. Prior to 1853 it was in Herbertshire Castle, near Denny, and a copy of it was made by Sir GEORGE HARVEY. The landscape is the work of VOSTERMAN, and the figures are by VAN WYCK. The work is in fine condition, and is supposed to be the oldest view of Stirling Castle which exists.

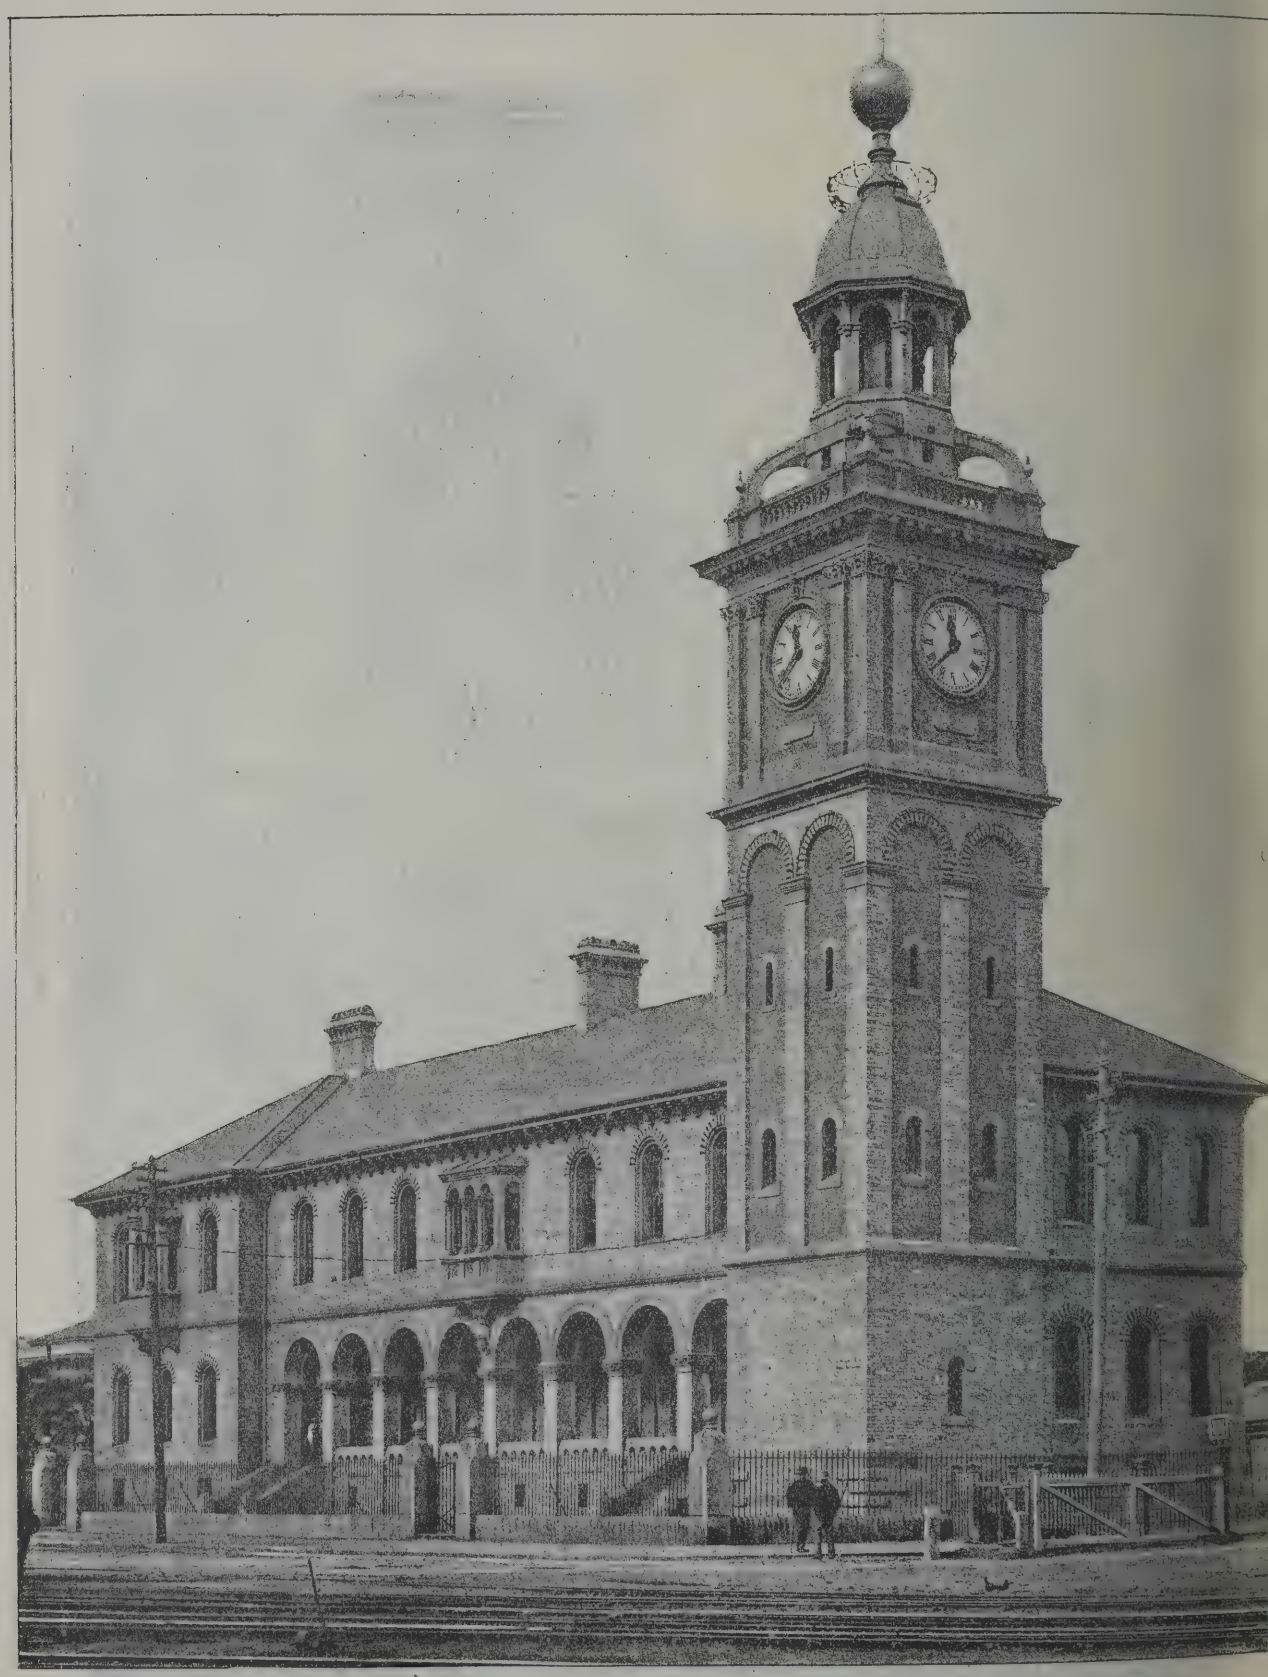
AUSTRALIAN ARCHITECTURAL NOTES.

[From a Sydney Correspondent.]

(*Continued from page* 274.)

THE Sydney Hospital is one of the more pretentious buildings in the New South Wales metropolis, and commenced with a supreme disregard of cost. This led suspension of building operations when the walls were :o the first floor. The refusal of the colonial Government proceed with what was regarded as an unnecessarily expensive undertaking led to a suggestion that brick instead of stone should be employed in the completion of the building, but ultimately it was arranged that stone alone should be used, it being urged that brick would absorb the disease germs. The edifice is admirably designed, with commodious wards and broad, airy passages throughout ; but the loggia system might have been introduced more largely with good effect.



In the later developments of colonial architecture, so far as public buildings are concerned, the predilection for the Italian style is especially noticeable, and in not a few

Sydney Hospital.

instances the general effect is enhanced by the erection of a lofty tower, as in the case of the Customs House at Newcastle, and the Court House and Post Office at Balmain, Sydney. These towers not only assist in breaking the sky-line, but also impart a touch of distinctiveness to the design, redeeming it from the imputation of being common-place. A satisfactory feature in connection with most of the later public buildings is that internal comfort and convenience are not, as in earlier days, sacrificed external show. The purpose for which a particular bui ing is required forms the first consideration, and after t has been provided for the general style of exterior a interior is discussed, and a somewhat harmonious combi tion of utilitarianism and artistic taste obtained.

ARCHITECTS' FEES.

THE case Perry & Reed *v.* Burney & Grimes and Mathams was heard before the Lord Chief Justice and a special ... on Monday. The plaintiffs sought to recover from the ...endants a sum of 1,030*l.* 15*s.* 11*d.* for professional services ...dered by them. The defendants, Messrs. Burney & Grimes, ...343 Strand, and the other defendant, Mr. Albert Mathams, ...e owners of the King's Head Hotel, Margate, and in Sep...ber 1897 they consulted the plaintiffs with regard to altera...ns they proposed to make in the structure of this hotel. The ...ount they were prepared to spend was about 8,000*l.* After ...e negotiation it turned out that it would be necessary in ...uilding the frontage of the hotel to set back the wall, and ...s involved extra expense. The plaintiffs prepared the plans ...d submitted them to the licensing committee and town ...ncil, and they were duly passed. Tenders for the work ...re then invited, and the lowest that was received was 14,790*l.* ...e defendants considered this was too high a price, and ...used to spend more than 10,000*l.*, and they asked the ...intiffs to reduce their estimate. Fresh plans were prepared ... the plaintiffs, and they applied to the defendants for payment ... account. No notice was taken of the application, but the ...fendant Mathams referred the plaintiffs to Messrs. Burney ... Grimes, as he stated he had sold his interest in the hotel. ...ssrs. Burney & Grimes declined to pay the amount claimed ... the ground that the plans were to be prepared on the basis that the alterations to be made were not to cost more than 8,000*l.* They, however, paid 100*l.* into Court to meet the claim against them.

The jury found a verdict for the plaintiffs for 800*l.*

WAKEFIELD CATHEDRAL.

ALTHOUGH the public have not heard much for some time with reference to the proposed enlargement of the Wakefield Cathedral as a memorial to the late Bishop How, we understand, says the *Leeds Mercury*, that the preliminary work is going on steadily, and it is expected that very shortly building operations will be commenced. The owners of the property on the east side of the cathedral have met the committee in a very reasonable spirit, and the four houses and shops required in order to enable the proposed enlargement of the cathedral to be carried out have been secured, and will, it is expected, be swept away. A claim in regard to ancient lights on the north side has also been amicably arranged, and some other matters have been disposed of. The Bishop of Wakefield has lately received several handsome gifts or promises towards the cost of the proposed enlargement, the following being amongst others:—Sir Edward Green, Bart., 1,000*l.*; Mr. M. E. Sanderson, Kettlethorpe Hall, 1,000*l.*; and Mr. Percy Tew, Heath Hall, 500*l.*

DURHAM CATHEDRAL.

AT the annual meeting of the Durham and Northumberland Archæological and Architectural Society, the president, the Rev. Canon Greenwell, delivered an address, which was mainly devoted to what had recently been done in the cathedral. He began by referring, says the *Durham Advertiser*, to the erection of Bishop Butler's monument. He agreed that a prelate of Bishop Butler's eminence well deserved a monument, but the place selected for it seemed most deplorable. Why it was allowed to be put where it was he could not conceive. He believed it was first proposed to put it alongside Bishop Lightfoot's monument. There was not a piece of untouched wall there, and Bishop Lightfoot's being a modern monument, he did not think the placing there of Bishop Butler's would have been any detriment to it. But it was objected to because it would destroy the effect of Bishop Lightfoot's monument. The authorities gave way to this remonstrance, and Bishop Butler's monument was transferred to the other side, where it came in immediate contact with the very beautiful monument to Bishop Hatfield. It did seem marvellous that nobody had protested and objected to the placing of Bishop Butler's monument in such a position, which must prove very detrimental to Hatfield's monument. It was an unnecessary and a wrong thing to do. Some people thought a piece of blank wall was an ugly thing and ought to be done away with. Any person possessed of judgment would know that a piece of blank wall was a most valuable thing in architecture. Well, this piece of wall remained untouched since Bishop Carileph built it in 1093, but had now been absolutely and totally destroyed by the insertion of a monument, which he could not say possessed any claims to merit as a work of art, or in any way adequate as a monument to anyone whatever. He thought that as at Lincoln the cloisters of Durham would have been a fitting place for such a monument. Where it was it was detrimental to the cathedral. Then they had recently had an examination of the grave in which the body of St. Cuthbert, according to the view of some people, rested, and according to the views of others did not. He really could not make up his mind whether the balance of evidence was in favour of one view or the other. He thought on the whole the evidence did lead to its being the body which was there during the Middle Ages, and which was always considered to be, and he thought probably rightly considered to be, the body of St. Cuthbert. Some people had objected to the examination because it was a desecration. He could not agree with that at all. He could not see what desecration there was if they reverently took up the bones of a person about which there was a great deal of doubt, and the examination of which was very desirable in order to settle questions in doubt. He failed to discover anything reprehensible in it. He could quite understand people who took the opposite view, but so far as he was concerned could see no harm in doing what was done. It was never intended that the bones should be seen at all. The examination was made upon the distinct understanding that the coffin made in 1827 was to be removed with the bones inside, and then when the pieces of the original coffin had been recovered replaced as found. But when the cover was removed it was found that the coffin made in 1827, which was a poor piece of workmanship, had absolutely fallen to pieces, and that it was impossible to remove the remains of the earlier coffins without raising the bones. These were taken out with the greatest care and reverence, and had been reinterred in a much more substantial and much better receptacle than ever before. Everything, he repeated, was done with care and reverence, and he did not see that any person concerned need feel any qualms as to being iniquitous people who desecrated graves and had no reverence for the holy people of old. Those present knew that ever since 1827 there had been in the cathedral library a large number of pieces of the original coffin made in 698. That coffin was most liberally covered with a series of sculptures made at that very early period, hence they would see how doubly interesting it was. They had nothing like it, and these sculptures upon St. Cuthbert's coffin possessed a very high interest, not only as showing the mode of workmanship, but also betokening the art they possessed at that time. They did, said Canon Greenwell, possess considerable merit and artistic feeling. He thought it quite possible to arrange these fragments so that he might get an idea as to what was upon the coffin. They did not know more than what Regmald had said; there were figures upon it. He made one or two attempts, but found it was difficult work handling the pieces. Well, these fragments remained until last year, when he thought it impossible to make them worse. Consequently he set to work, and with the valuable aid of Canon Fowler, and the help of others, he had struggled on until he had now got together a very great part of the lid, the two sides and the two ends, and they could now see exactly what the carvings had been. They had thus got the coffin completed up to a certain point, but knew that a great quantity of fragments had been put into the grave in 1827, and as he found no part of the bottom of the original coffin, or of the second lid and false bottom, and felt quite they were still left in the grave, which might also contain s portions with sculptures upon them. It was in order to ob these that the grave was reopened, and he could not think person could object to it as being an improper thing to do was due to the unforeseen occurrence of the utter decay o coffin of 1827 that the bones were interfered with at all. He been able to put together several of the pieces recently found was afraid he would have to be satisfied with that for present. There were thousands of pieces, and if anyone w like to set to work to sort them preparatory to putting t together he would be much obliged. He did not dar attempt it. He would have to be satisfied with having together practically all the parts which contained any sculp upon them at all. Canon Greenwell went on to say that Dean and Chapter had very liberally decided, possessin they did a very valuable collection of Roman altars and c sculptured stones, and a still more valuable collection of conquest and memorial stones, to print a fully illustr catalogue of the collection. An eminent antiquarian Oxford had taken in hand to do the Roman part, and the So of Antiquaries at Newcastle was also helping in the ma whilst he himself undertook to write an account of the pre- quest stones. The President went on to speak very highly o very accurate drawings made or being made by Mr. Footitt, w would be reproduced by one of the photographic processes so common and yet so useful. He thought it would be a desirable thing to add a representation of St. Cuthbert's c in the form of an appendix. Therefore, added to the catal there would be a very accurate rendering of the sculpt that remained on the coffin, and he thought the catal would form one of the most valuable books connected early sculpture in England that had yet been produced. was sure nothing in the world had ever been produced lik Dr. Greenwell then described the part he had taken in getn together the collection of pre-conquest and memorial ste and, to the delight of his audience, told how after being ref possession of a valuable child's grave cover, which shortly af wards was broken up by the sexton's wife to be conve into sand, he subsequently annexed similar specimens a like situation when he came across them. He confessed sins, but firmly declared he would do the same again. Greenwell went on to speak of the desirability of iss another part of the Transactions, for which they had got a siderable sum of money. On behalf of the members he ha ask Canon Fowler if he would write an account of the open of St. Cuthbert's grave, which they should have fully illustre with everything connected with the grave, and with a views far as they could get, of the bones which were found. thought if they very sweetly approached Canon Fowler, h had already undertaken to write for their Transactions account of the old abbey well discovered a year or two ago would consent. Canon Fowler gave a somewhat reluc acquiescence, and the President added that he propose give an account of pre-historic sepulchral remains which a been found in the counties of Durham and Northumberla including the urns recently found near Stone Bridge.

ROUND TOWERS OF IRELAND.*

(*Continued from page* 270.)

Reputed Origin of the Round Towers.

AS regards the word "origin" I fear it is and has been a misleading expression. I would therefore rather con myself to what I consider the period or periods of the probable erection of the towers, but whatever may have been the peo at which the first round tower was erected in Ireland, there hardly be a doubt but that they are a type of a structur structures still older or evolved from some particular ide that the word "origin" pure and simple may possibly date ba to the remote ages of prehistoric antiquity. Places appropriat to religious worship are of very early origin. In the sa writings we have evidence of their existence from the remo periods. Their prototypes are implied in the history of h antediluvian patriarchs, in the altar erected by Noah, in h pillar set up by Jacob which he called "God's House," in h sacrifices of the first diluvian age, as well as in the circl stone set up by Moses at the foot of Mount Sinai, and by Joshua at Gilgal. They are found in the early temple o Egypt, and in the gorgeous tabernacle raised by divine co mand in which the children of Israel worshipped.

The earthen raths and stone circles of Ireland appear t be the first mechanical constructions known to Irish his ry. Within these circular raths and stone circles were sm le circular buildings in the shape of caves and what have ge

* A paper read by Mr. Antony Scott, M.S.A., at the meeti of the Society of Architects on April 27.

termed "beehive cells," hidden beneath the mechanically formed mounds of earth, clay and stones. The outer circles and entrenchments or fosse were the ramparts or the defences. Structures of this kind are to be found all over the country, notably in New Grange, Dowth and Knowth, in co. Meath, near Drogheda. They are said to be sepulchral erections, possibly primitive dwellings or enclosures of the pagan Irish. We go on from these to the dry stone cashels on the south-west coast of Ireland, as at Gallerus in co. Kerry and islands in the Atlantic off the same coast, and in various other parts of the county in mountainous districts. We find the circular cells built of dry stones laid in horizontal courses sloping inwards towards the top in the shape of a beehive and covered on top with a single stone. The cashels appear to be the earliest stone buildings of Christian times, and they consisted of a number of circular detached beehive cells in most instances protected by a circular dry stone wall, as at Dun Angus on the island of Arran, in Galway Bay, at Gallerus, in co. Kerry, and on the Skellig Rock in the Atlantic off the same coast. In the case of the cashel at Gallerus the spaces between the different cells have been filled in with dry stones, and built low, covered passages connect the different cells with the exterior face of the wall which bounds the group of cells, and which appears to have originally stood about 6 feet high. We pass on from these groups of beehive cells to the larger single round or detached circular houses, some of which are still to be found on the south and west coast, for instance, in the island of Lough Lee, in Kerry, and Ardilaune off the coast of Connemara, and elsewhere. There can hardly be a doubt that these circular monastic cells and enclosures were a development of the raths and earlier cells found in the raths constructed by the Pagans of earlier days. These groups of monastic buildings must have also produced the single isolated round houses or churches already referred to.

Now if we examine carefully the remains of all mechanical constructions found in the country in the shape of defences and enclosures whether of earth or stone, as well as all domestic and sepulchral caves, whether of the early Christians or of their Pagan ancestors, we shall find them all circular in plan, and when we come to Christian times we shall find them all developments of and improvements on the circular beehive cell. It is admitted, and as a matter of fact must be admitted by all who have taken any interest in the subject, that more than half the number of towers which at one time dotted the land have perished. The round tower of Annaghdown, co. Galway, built, according to the "Annals of the Four Masters," in 1238, has wholly disappeared, and even tradition cannot point out the site which it once occupied. The first towers built may have been but very insignificant structures, and in confirmation of this I may state that some of those which remain would be no very extraordinary development of the circular stone cells and churches of the early Irish Christians. I consider that there is no need to go to the St. Simon stylite towers in India or Persia, or to search in Eastern or continental countries for prototypes. I have not the slightest doubt as to the original towers having been simple developments of the circular buildings which obtained at the time.

According to Miss Margaret Stokes, who published a handbook on "Early Christian Art in Ireland" in 1887, the type was not peculiar in this country before the eleventh century, and even now she says that twenty-two foreign examples may be added.

The late Viollet-le-Duc, an eminent French architect, attributes the erection of towers in France to the necessity which then existed of protecting the churches from the attacks of the heathen Northmen in the valleys of the Loire and Seine, as well as on the north and west coasts of France, and he remarks that it is in countries which were particularly ravaged by the periodical incursions of the Northmen, that abbatial and even parochial churches were preceded by massive towers, of which, he says, unfortunately nothing but the lower stones are left to us.

Fergusson says, "There is perhaps no question of early Christian archæology involved in so much obscurity as that of the introduction and early use of the towers."

Canon Smiddy published in 1873 a book entitled "The Druids' Ancient Churches and Round Towers of Ireland," in which he puts forward a most peculiar theory respecting the origin and uses of the towers. He says the towers are reed houses; that the idea has come from a reed which grows in marshy ground, and terminating with a conical head is the prototype of the round towers. The use to which he assigns them is for baptisteries. He bases his argument on the pronunciation of the Celtic word "cloicteach," which means "cloic" a bell, and "treach" a house, which he says is confounded with and taken for the "cuile" a reed, "ceach" a house—reed-house. In support of this theory he wanders off to Florence, Pisa and other continental cities which have had baptisteries attached to the episcopal churches, and tries to establish a similarity of construction and uses between the baptisteries referred to and the round towers of Ireland, where none whatever exists. So wild and absurd are the theories put forward that it would be waste of time to follow his arguments for the purpose of showing how groundless they are from start to finish.

The late Very Rev. Canon Ulick J. Bourke, professor of languages, St. Jarlath's College, Tuam, published a work in 1875, entitled "The Aryan Origin of the Gaelic Race and Language," in which he devotes the greater portion of two chapters to the subject of the round towers. He holds that the round towers were built in the early Pagan period by those of the Aryan race who had settled in this Island of Destiny, but that after the Gospel had been preached in Ireland by St. Patrick, he turned the round towers, as he did the Pagan foundations, to the service of Christian rites, and hallowed them by Christian practices and religious associations. This fourth opinion, as he calls it, is that which seems to His Grace, the Most Rev. Dr. Mac Hale, the most convincing and the best supported by reason and authority (p. 352).

His Grace of Tuam was an eminent churchman, and a guiding star in the domain of Irish politics in his day, but I have never heard or known that he took any interest in Irish antiquarian research, and hence it appears to me that Canon Bourke very easily impressed Dr. Mac Hale with his plausible theory of the Pagan origin of the round towers. Besides, His Grace was fast approaching the end of his eventful life at the time the work was published. Canon Bourke brushes Dr. Petrie aside to make room for his own Aryan or Pagan origin idea, and tries to prove from the highly artistic work of early Christian times—for instance, the illumination of the Book of Kells and other artistically illuminated MSS., as well as highly artistic metal works, &c.—that the pagan Irish, the progenitors of the early Christians, were all so far advanced in arts and sciences.

No person who has read Dr. Bourke's book will deny that he was a philologist of distinguished merit, but that is not sufficient proof that he was very well qualified to deal with the subject of the round towers, which the following quotations from his work will more fully explain. Canon Bourke confined the practical part of his examination to an inspection of the remains of the round towers at Kilbannon, near Tuam, Roscane, near Galway, and possibly one or two others in the immediate vicinity of his home. The towers alluded to are but poor specimens of the round towers of Ireland. He goes on to state, at p. 376, "It appears to the writer that the stones of all the round towers have been taken from some two or three quarries, just as in Egypt the stones which went to the erection of the pyramids had been all dug from the same quarries in the Lybian Mountains, west of the Nile." This is the most reckless statement which could possibly be made by any writer in face of the fact that in every single instance the towers are constructed with materials—stones—found in the immediate neighbourhood of these structures.

In Glendalough, co. Wicklow, the stones used for general walling are the greenish mica slate (which is the general formation of the local hills and mountains), mixed with granite boulders, which are to be found scattered over the adjoining hills and valleys, carried there by icebergs during the glacier period. In Ardmore, in the co. Waterford, and Clonmacnoise on the Shannon, the round towers are wholly composed of sandstone; in Kilmacduagh, in the co. Galway, the tower is built with local blue limestone; in Devenish, in co Fermanagh, the exterior of the tower is composed of sandstone grit, found in boulders along the lake shore. The interior is lined with limestone, which does not stand the weather so well. And so in every district in Ireland the same thing occurs. The towers are in every case constructed with stones similar to those which are to be had in the immediate neighbourhood of these structures. In the neighbourhood of Kilmacduah, in the co. Galway, there are hundreds of acres of blue limestone, naked rock, firm and compact, forming an excellent building stone, wholly uncovered by any earth, furrowed and honey-combed by the action of the weather. Similar honey-combed stones are plainly visible in the interior of the tower foundations. Continuing, he says:—"The pillar towers of Ireland are a standing proof of the perfect knowledge in the art of building possessed by the people who at first planned and erected those defiant 'conquerors of time.' Like the Book of Kells, they are even to the present hour abiding proofs of the consummate art which left to posterity such enduring monuments in architecture as well as in the art of dyeing and painting. The ancients had regard to durability, and in this aim they have certainly surpassed all modern schools of science and art. Nothing at the present day can be executed with pencil or chisel that would, like them and the pyramids of the ancient world, stand the 'test of time.'" This is a fallacy which I must strongly contradict, so far as building construction and building materials are concerned. The towers are not at all imperishable, and when I come to consider the question of construction, I shall deal more fully with this point.

Before Dr. Petrie's time the prevailing general opinion was that the towers were of Phœnician or Pagan origin, Buddhist

temples, fire temples, places of sepulture. Many held that they were of Danish origin, or rather built by the Danes. As regards the Danish origin it will be admitted that the Danes were never fully established in Ireland, and for the intermittent periods during which they occupied the country their greater strongholds were Wexford, Waterford and Limerick. If they were the builders of the towers, it might be naturally expected that in the districts in which they had the strongest foothold most of the towers would be found to exist, whereas the contrary is the case, for there are but very few pillar towers in the counties in which they had their most permanent settlements. If these Northmen from Denmark and Scandinavia had built these towers in Ireland, why did they not erect round towers in Normandy, Belgium, Denmark, Jutland and Scandinavia? It is quite clear that the Danes never had anything to do with the Irish round towers, for if they had structures of a similar character would be found in other countries invaded by them, but no monuments of the kind are to be found in the countries named. It is therefore manifest that the Danes never built these towers.

The Very Rev. John Lynch, Archdeacon of Tuam (referred to by Dr. Petrie as the celebrated John Lynch), the author of "Cambrensis Eversus," states that Geraldus ascribes the erection of the towers to the Danes. This is a very great error, as Geraldus says no such thing; he merely states that the towers were erected "*more patriæ*"—"after the manner of the country."

Dr. Petrie says the hypothesis of the Danish origin of the round towers is one which has obtained so little attention latterly that it may perhaps be thought wasting time to show the weakness of the evidence adduced by Dr. Molyneux to support it. Dr. Molyneux's reasoning as to the Danish origin of the sepulchral mounds and forts had failed to make an impression, not merely on the minds of the learned in Denmark, but even on that of his own most intelligent brother; and hence the whole superstructure as to the origin of the towers must necessarily fall to the ground. Indeed, from the whole tenor of the Irish annals it may be seen that the Danes, a rude and plundering people, were far from being the builders of ecclesiastical edifices, and, except in a few of their own maritime towns in Ireland, that almost invariably during their settlement in the country they were the remorseless destroyers of them; and though it might be conceded that on their conversion to Christianity in the fifteenth century they may have founded a round tower belfry in Cork or in any other town which they inhabited, yet the probability is quite against such a supposition, as we are altogether without proof of their having done so. The tower of Cork was connected with the ancient church of St. Finbar, founded in the sixth century, and perhaps coeval with it, and no round towers of this kind have been discovered in connection with any of the edifices which the Danes are said to have founded in Dublin, Wexford, Waterford, Limerick, or elsewhere.

We have it on the reliable authority of French historians that round towers were built in certain districts of that country in connection with churches, for the protection of church furniture, and in districts only which were subject to the periodical incursions of the heathen Northmen. It is quite evident that the building of the towers of Ireland became a necessity during the centuries in which the country was subject to the invasion of these northern hordes.

Mr. Marcus Kane, M.R.I.A., in a work published by him in 1867, entitled "The Towers and Temples of Ancient Ireland," states that there have been 120 round towers in Ireland, and that the remains of sixty can be traced. Mr. Kane has evidently made a close study of the towers, and states that he travelled more than 5,000 miles through Ireland, chiefly on post cars, to inspect, measure and to sketch the then existing remains. His drawings and illustrations are no doubt accurate and well got up, but I fear he has but a poor following as regards his extraordinary theory as to the period and the people by whom the towers have been erected. Mr. Kane proposes to show that the round towers were built by the Cuthites, as he calls the immediate descendants of Ham or Cham, and the progenitors, according to him, of the Scythian race (p. 207). Canon Bourke flatly disputes this point, and states on good authority that the Celts of Ireland (the earliest as well as the latest migration) were the descendants of Gomer, the eldest son of Japhet. The Irish, Welsh and British are all of the race of Japhet's eldest son.

This view is entirely opposed to all those who say that the Celts of Ireland are descendants of the Phœnicians (see "Biblical Geography," by Dr. Rowsen Mullar; Dr. Pye Smyth's "Biblical Encyclopædia"). It would be perfect waste of time to follow Mr. Kane's wild theories and trace them back step by step to the remote cradle of the Scythian race. As a matter of fact the difference between one theorist and another of the Pagan origin champion writers differs only in detail in ascribing the construction of the round towers of Ireland to one branch or other of the human race which had its origin in Asia and spread itself over the continent of Europe at one period or another. The earliest reference to these bell houses, found in the Irish annals and appended to Lord Dunraven's "Notes on Irish Architecture," occurs in the year 950, and merely refers to the tower of Slane as existing at that day, but how long it existed before that date is uncertain. It may be here mentioned that no trace of this tower exists at present, while considerable portions of the monastic buildings and a later abbey church with square tower at its western end remain standing.

Captain Grose, F.S.A., published in 1791 two beautifully-illustrated volumes entitled "The Antiquities of Ireland," and he falls into the same error as other writers who support the Danish origin on the subject, by stating "our round towers are coeval with the chapels, and are also Ostmen productions." Various are the conjectures concerning their origin and use, but from an uninterrupted tradition of 542, I have shown it is more than probable that they served as belfries from the beginning: five or six of them to this day certainly do. If they were erected in times of Paganism, some proof ought to be alleged of the fact of masonry being then known, or to what particular practice in the ancient ritual they referred. The absence of Christian emblems in the architecture of the towers was another argument used by the Pagan origin party in favour of assigning them to Pagan times. But that this is entirely opposed to actual facts is perfectly plain to anyone who takes the trouble to inquire.

So much for the Pagan origin side of the question. I have always maintained that if we had architects and artisans in pre-Christian times capable of constructing such beautiful cylindrical shafts, progressing from coarse spawled rubble, as at Drumcliffe and several other primitive towers, to coarse hewn ashlar with carved and moulded work, as at Devenish, Ardmore, Kildare, and Timahoe, surely they would not confine their skill to the towers alone; they would in all human probability have left us other traces of their skill and workmanship. But what is the fact, besides the round towers alone not a single champion of the Pagan origin theory has ever attempted to point out another single fragment of solid rubble or other masonry work in the whole country which they could say dated from the pre-Christian times. They can point to no pre-Christian erections but the cromlech, the earthen rath, the Druids' altar, the pillar stone and the cairns or mounds of dry stones said to mark the last resting-place of some great Pagan chief, king or warrior.

In the case of the Christian origin theory we have numerous remains of ecclesiastical architecture resembling in every detail the workmanship and material used in the towers, both standing side by side and presenting the same weather-worn appearance. In many instances the tower would appear to present later and better-preserved workmanship, as shown by the unerring eye of the camera. It would be perfect waste of time to trouble you with unnecessary proofs of the true analogy which exists between the masonry of the towers and that of the churches. As a matter of fact, in many instances the tower appears to be much later work than that of the adjoining ecclesiastical buildings. Take, for instance, Ardmore, Devenish and Kilmacduagh. I quote the following hypotheses from Dr. Petrie, p. 107:—(1) That they were anchorite towers; (2) that they were penitential prisons; (3) that they were belfries; (4) that they were monastic treasure houses; (5) that they were watch towers and beacons.

1. *Anchorite Towers.*—The hypothesis that the towers were erected for the use of anchorites, in imitation of the pillar of St. Simon the Stylite, originated with Dean Richardson, of Belturbet, and had been warmly advocated in his edition of Ware's works and in later times by the celebrated architectural antiquaries, Dr. Milner and Mr. King. The arguments adduced in support of this hypothesis rest almost entirely on the supposed agreement in form, size and internal construction between the Irish towers and the pillars of the Eastern anchorites, to prove which Harris is at great pains to establish a uniformity which it will be easy to show certainly never existed. The first point of agreement, as Harris gravely states, consists in both being of a round form. "Those of Asia were in form round, so are ours." This I am forced to concede. Secondly, the Eastern pillars were of various heights, so are ours. This, too, I must allow; but the Eastern pillars varied in height from 6 cubits, or 9 feet, to 36 or 40 cubits in one of greater celebrity, while the Irish towers varied in height from 60 to 130 feet. The only point of agreement therefore is in each class being of various heights, and on the same data Harris might with equal justice have asserted a common origin for any two classes of objects, however differing in other respects. Thirdly, that they were hollow as ours are. This agreement Harris endeavours to establish in opposition to the learned Bollandist who expressly states that the Stylite columns were solid. Various other proofs could be adduced to refute the suggested similarity, but space does not permit, neither does the necessity exist.

2. *Penitential Prisons.*—This theory was first promulgated by Dr. Smyth, the industrious author of some of our county

histories, on the authority, as he states, of Irish MSS., which however he has not named in his works, and they have never yet been brought to light. He (Dr. Smyth) bases his theory on the construction of one or two Latin words ; there is nothing in his arguments to bear out the interpretation or construction which it adduces.

3. *Belfries.* 4. *Keeps of Monastic Treasure Houses.* 5. *Watch Towers and Beacons.*—Dr. Petrie says :—"As these theories are only erroneous in their exclusive application and are somewhere applied conjointly, it is very evident that whatever may have been the original intention of the builders as to the use to which the towers were intended, or that they have in course of time been put to other uses as the necessity arose, it would be rather an absurd assertion to state that the large towers which we see standing before us to-day were built even so far back as early Christian times to hang the tiny little hand-bells which were then in use ; but with later developments of both buildings and bells there can be no possible doubt as to the fact that the towers served as bell-houses."

(*To be continued.*)

TESSERÆ.

Development of Egyptian Architecture.

THE tombs of Beni Hassan may be considered as the earliest types of the mystic styles which pervaded all the monuments of Upper as well as Lower Egypt. The Temple of Abu Simbel is one step in advance upon the sepulchral avenues of Beni Hassan. Here the excavated chambers are enlarged and greater development given to the antechamber. The Temple of Guircheh is a still greater expansion of the primitive idea. The original tomb had subsequently added to it a forecourt and a front pylon or entrance gate, which obtained in all the later temples of any note. These three steps in Egyptian architecture mark the progression of the ideas of the people in that art. Their first construction or, as it may be rather called, architectural formation was a long and narrow passage with occasional enlargements to receive the embalmed remains of the dead, a mysterious and of itself an obscure abode of the departed. But the Egyptians did not stop short here ; these were abodes of the departed, which might vie with the dwellings of the living. The pillars were left to uphold the roof, as in the excavations of our coal, gypsum and stone quarries ; the ceilings now flat, now curved, now inclined to a pitch, and the walls were covered with a profusion of sculptured incisions, painted in various brilliant colours and representing in splendid series the deeds of the king or hero, his judgment and glorification. These pillars were with the Egyptian the original types of their after columns—massive, short and simple in their parts. The same piers more profuse are at Abu Simbel and more embellished, having standing and attached figures of deities in front. The whole surfaces of the interior are covered with sunk sculptures, also enriched with dazzling tints, and the front rendered important and magnificent by the four gigantic sitting gods, who seemed to guard the portal of the sacred excavation, and to preside over the destinies of the river which flowed at their feet. The Temple of Guircheh seems by its propylon and forecourt to keep the respectful worshipper still more remote from the fane, and to induce a preparation of mind ere he enters the hallowed mysteries of the place. We find the four colossal attached figures in front of Abu Simbel removed here to the front of the propylon, detached and independent of the wall, and the solar ray, the emblem of their great divinity, embodied in the obelisk, an additional symbol in the round of mysterious devices in which the Egyptian priests enshrouded their theology. In all the endless successive dynasties and the dominion of varied conquerors, piles of gigantic dimensions, groups of enormous extent and colossal proportions rose on the banks of the Nile ; each ruler seemed ambitious to mark his reign by a stupendous monument of his glory or to propitiate the favour of their cherished gods by successive additions to their vast temples, or by pompous accompaniments, such as propylon, courts, obelisks, colossi and paved ways bordered with endless avenues of multiform sphinxes—Carnac and Luxor, above a mile apart, were united by a stone platform of such a character, and other ways diverged from various parts of the precinct to the several quarters of Thebes. The square pillars of the caverns of Beni Hassan were gracefully rounded in the porches and halls of Carnac and Luxor ; at Thebes the Egyptians called in aid the elegant forms to be found in the plants of the Nile, or in the vegetable productions on its banks ; the bud of the lotus and its developed flower gave features for the general outline of the capitals of the columns, and the palm tree and bundles of reeds occasionally suggested an idea for the shafts of the pillars.

Architectural Style.

Style in architecture is the perfect harmony between the means and the end, which is found in all the ideas and desires of the highest type of man. Refinement of detail is indispensable, largeness and breadth are its natural forms of expression ; but in certain places it may give greater grace to the most intricate and delicate work. It is this noble quality which is essential in good art, and it is as possible to have it in a building as in a man or a beast. The essential condition is that style should be a true and sensible expression of simple and abstract principles or requirements. It has nothing whatever to do with styles of architecture, as we call them, for it is possible that every one of these in succession may afford examples of incontestable style. This, at least, is clear, that a vast chasm exists between architectural designs ; that some are vulgar, affected, mannered, whilst others are natural, simple and dignified ; and that whilst the only admiration ever extorted for the former is that ignorant love of a new thing which is so evanescent and so little to be respected, the admiration of the latter increases as they grow older, and year by year becomes more certain and universal. The popular voice, which finds something worth loving after an age has passed since the construction of a building, is as unerring in the correctness of its judgment as the supposed approval of a new work is fallible and to be mistrusted.

Style in Painting.

Nothing appears to create so much interest among the dilettanti artists, when discoursing upon the merits of pictures, as that peculiar quality of art, execution, commonly designated manner or style. In rhetoric the schoolmen have been able to prescribe laws for composition, which comprehend almost all the rules that learning and reflection could invent for the regulation of literature, and from which it would be deemed a dangerous experiment, even for genius, to attempt to depart. In painting, too, there are some vague laws for composition, but the writers upon this art having been fewer and the academies having settled no general principles nor promulgated their doctrines for the regulation of practice, these laws have never been clearly defined. Hence each individual disciple of every school, as well as every artist independent of academical instruction, has been at liberty to exercise his talent almost without control. Nature is the prototype from which he is allowed to collect his imagery, and to represent her and her attributes with all the license of a poetic fancy or with rigid truth ; for although one painter is justly more admired for his execution than another, yet there are no established dogmas to impede the operations of the pencil ; in portraying whatever the artist may select for imitation, he is free to exercise his art to the full extent of his original feeling in any manner or style of his own. This license constitutes one of the greatest felicities of a painter, wherein he has a manifest advantage over sculptors, architects, poets, musicians and other men of science, being left in so important an attribute of his art the entire exercise of his taste. The varieties of this quality, then, in painting termed style, seem amenable to no bounds ; each artist, according to the faculties of his eye and hand, will be found to vary the mode of execution almost as extensively, perhaps, as we see in penmanship, where, among the thousands copying from the same exemplars and taught by the same preceptors, yet no two will be found to write entirely alike.

Architects and Clients.

Of opportunities in architecture there are two sorts—the most obvious and intelligent one that of having a building to execute which affords some scope for design or the display of taste; the other, that of being not only permitted but encouraged to treat the subject con amore, and to satisfy oneself. To talk of an architect's being left to satisfy himself—though some, by-the-by, seem to be very easily satisfied with themselves—may sound strangely to those who look upon him as little better than a tradesman, not as a professional adviser in art, but a sort of apothecary, who has merely to make up their own prescriptions. Nevertheless, it is so essential an architect should have such liberty granted to him that he who shows himself indifferent to it almost forfeits the name of artist, showing himself to be little better than a mere hireling. Of course, this is to be understood grano salis, according to the circumstances and importance of the case; neither is it to be supposed that employers and their wishes are to stand for nothing in the matter, as if it were of very little moment whether they were satisfied or not. Let employers explain their ideas and urge their own particular views, but let them also listen patiently to those of the artist himself, otherwise they show either that they more than doubt his capacity, or that they shrink from listening to arguments that may convict them of ignorance or of obstinacy. Architects themselves, on the other hand, might sometimes profit by the hints and remarks of their employers, and should feel rather inspirited, certainly not discouraged, when they find their designs strictly scrutinised, instead of all their merits being detected at a glance, in which latter case it may be presumed the merits are rather superficial and not very numerous. Excellently well it is observed by Chateauneuf :—"Undoubtedly it is very pleasant to an architect to meet with

an employer disposed to give him carte-blanche and permission to follow out his own ideas unrestrictedly; yet it is still more delightful to meet with one who, instead of merely passively acquiescing, assents from conviction after deliberate study of the ideas submitted to him, and from the lively interest he takes in them."

The "Liber Veritatis" and the "Liber Studiorum."

The "Liber Veritatis" contains facsimiles, as near as the art of engraving could make them, of sketches of landscapes and sea-pieces, by Claude, being a collection of memoranda of subjects which he had painted, or studies from which he intended to paint, with perhaps loose hints for future composition. The paintings of this great artist for colour, general harmony, truth of aërial perspective and purity of execution are as near perfection as art has yet been known to proceed in the imitation of scenes in nature, as viewed under the influence of a clear atmosphere and serene sky, such as Italy so frequently affords, and which this judicious painter almost invariably chose for the objects of his imitation. Claude's great excellence lay in exhibiting the elegant pastoral. The grand epic style he rarely attempted, and when he did he failed. The bold features of composition form no part of his general attention; hence these sketches, whether touching form, light and shadow, or the leading principles of composition, abstracted of colour and harmony, are the worst exemplars that can be laid before the student who would desire to improve himself in the art of designing landscape. Indeed we feel no hesitation in saying that the work, with few exceptions, is a collection of scraps, some from nature and some from the imagination, forming a series of scattered compositions, which are deficient in sound principles and puerile in design. Turner's "Liber Studiorum," on the contrary, we should recommend to teach those very properties in art of which this work of Claude's is so deficient. The designs of Turner are classed under the heads epic, pastoral, marine, &c., a division not merely in the titles, but maintained with true discrimination of their separate characters, and upon principles that are obviously the result of this artist's great knowledge of composition, as it embraces all that can be represented in one colour, namely, form, light and shadow, proportion, fitness and general effect. This work, which is an honour to the British school, we would, with deference to all the real admirers of what is excellent in ancient art, hold up, in preference to any that has appeared, as the best perceptive book of studies for the amateur of landscape that ever issued from the press.

Elizabethan Interiors.

Previously to Elizabeth's reign the floors were of different materials. From a very early date we find them described as sometimes paved with tiles of various colours, and laid in chequer-work—the hall at Hampton Court was "floored with painted tyle"—they were also of stone; and when boarded floors were adopted they were of coarse substantial workmanship, sometimes, instead of crossing, laid parallel only with the joists, and not depending on them for support. The doors also were of a rude character, being seldom framed, as they were usually covered by the arras; but in Elizabeth's time doors of all kinds were panelled, as well as the ceilings and wainscotting of the walls, and often decorated with painting and devices. The elaborate fretwork of some of the ceilings of the time, ornamented with bosses and pendants, is admirable both in design and execution; and the framed roofs of the great halls were so well put together, and of so ornamental a character, as to form one of the principal features in old houses. The roof of the great hall at Hampton Court is an admirable specimen, though partaking more of the Gothic than the Elizabethan, and has the advantage of being easily accessible to an inquiring observer. Glass windows were another prominent feature in these dwellings. This material, though early introduced into England, was so costly that it was not unusual to take out the window-lights on the departure of the master of the house and lay them up for safety; but in Elizabeth's time it was in general use, and was sometimes carried to great excess. "You shall have," says Lord Bacon, "fair houses so full of glass that one cannot tell where to be come to be out of the sun or cold." And Lysons mentions a window at Collacombe in Devonshire containing 3,200 panes of glass. Stained-glass also was a favourite ornament of the superior rooms of mansions and palaces, adorned with figures in the most splendid colours. It was known as early as the thirteenth century, and was much cultivated in the reign of Henry III. Carpets not having at this time come into use in England except as the coverings of tables, or occasionally as foot cloths for the throne, &c., rushes and sweet herbs appear to have been the substitute, both in public and private houses. Though the private rooms and rooms of state were sometimes matted, yet rushes were the general strewing; Queen Elizabeth's Presence Chamber even was strewed with them, and we meet with constant reference to them in old authors. Footing must have been very insecure on such floors, though it appears they were used even in ball-rooms.

Greek Masonry.

The ancient Greeks were as empirical in their rules upon the proportions of each stone they employed as upon the proportions of the whole design. Thus it may be observed, for example, that the size of the stones in the Erechtheum and in the Parthenon differ in about the same ratio as the one differs from the other. For the actual proportion of the stone itself no direct rule can be given, nevertheless it is found that the geometrical ratio of 1. 2. 4. is by no means unfrequently employed. Symmetry also was considered as necessary in the position of their joints as in the composition of the plan, or the position of their triglyphs and mutules, and these may be observed as occupying the same place in nearly every similar construction. The Greek joint, whether it be executed in marble or in stone, is a thing really to marvel at. It is, indeed, scarcely visible. Its perfection arises from the amount of skill and labour bestowed upon it, and from the peculiar method of working the two surfaces. There are grounds for believing that there was a universal method adopted in all ages by that nation, nor was it confined to the Greeks alone, it having been handed down to and practised by the Romans also, as can be observed in the Coliseum and Arch of Septimius Severus. It, however, at length became either lost or disused.

GENERAL.

Mr. Waterhouse, R.A., as assessor in the Cartwright Hall Competition, has made the following selection:—First prize, 150*l.*, Mr. J. W. Simpson and Mr. J. Milnes Allen, of 10 New Inn, Strand, London. Second prize, 100*l.*, Mr. A. R. Jemmett, of Great College Street, Westminster. Third prize, 50*l.*, Mr. W. H. Pite and Mr. R. S. Balfour, of Upper Montague Street, London.

Mr. John Cassidy, of Manchester, has just completed the model for the bronze statue of the late Sir Benjamin Dobson. It is a very large work, the figure being nearly 10 feet high. The subject is represented in his mayoral robe with the chain of office round his neck; his right hand is extended, holding an eyeglass, while the left, clasping his cocked hat, is pressed to his side.

Subscriptions amounting to nearly 4,000*l.* have now been contributed towards a statue in memory of Mr. Gladstone to be erected in Glasgow. A sculptor and a site have to be selected.

Mr. O. O. Wrigley on Saturday laid the memorial-stone of the Bury Art Gallery and Public Library which Messrs. Woodhouse & Willoughby have designed. The building will cost 21,000*l.* A collection of pictures and sculpture valued at 100,000*l.*, presented by the Wrigley family, is available for disposal in the galleries when completed.

Mr. Arthur B. Potter has offered to the Rochdale Corporation a bust, with marble pedestal, of his father, Mr. T. B. Potter, who represented the borough in Parliament for thirty years.

The Trustees of the Chantrey Bequest have purchased the following pictures:—*Approaching Night*, by Mr. Davis, R.A.; *The Battle of the Nile*, by Mr. Wyllie, A.R.A.; *Off Valparaiso*, by Mr. Somerscales; and *My Lady's Garden*, by Mr. J. Young Hunter.

The Design sent in by Mr. T. W. Aldwinckle has been adopted by the St. Pancras Vestry for the new baths, which are to cost 50,000*l.* The other competitors were Messrs. E. Harnor, F. Pinches, Spalding & Cross, Francis J. Smith, R. Stephen Ayling and E. P'Anson & Son.

The Marlborough College Mission, having built St. Mary's Church and Vicarage at Tottenham, are now completing their scheme by erecting a parochial building, consisting of a church hall, men's club house and caretaker's cottage, the memorial-stone of which was laid by H.R.H. the Duchess of Albany on Saturday afternoon, the dedication service being said by the Bishop of London. The whole group of buildings is from the designs of Messrs. Cutts. The Duchess takes a great interest in this mission, the late Duke having been a governor of Marlborough College.

The Post Office authorities have offered to purchase Blackburn Town Hall for the sum of 30,000*l.* The Corporation, before accepting, are considering the feasibility of altering the building to suit present requirements.

Mr. Francis Cross, who was an authority on subjects relating to the archæology of the Canterbury district, died on April 27.

The Trustees on the estate of the late Provost Orchar, architect and engineer, Broughty Ferry, who bequeathed to Broughty Ferry his collection of books, works of art and violins, valued at 12,936*l.* 10*s.*, have made application to the Treasury for a remission of the estate duty, and they have received intimation that the duty would be remitted.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT

In view of the many difficulties which are certain to rise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. *on Thursdays.*

NATIONAL REGISTRATION OF PLUMBERS.

THE annual meeting of Registered Plumbers was held last week at Glasgow. The vice-president of the Council (Mr. John Gordon, architect) was in the chair. The annual report gave full details of the educational work carried on by the Council in theoretical and practical plumbing classes in Glasgow and Ayr, and dealt with other matters connected with the registration movement. After the adoption of the report and elections to fill vacancies on the District Council, Sir John Neilson Cuthbertson presented the bronze medal of the Worshipful Company of Plumbers and the various prizes and certificates gained by journeymen and apprentices in the Glasgow and West of Scotland district in connection with the Exhibition held in Glasgow last year; afterwards delivering a stimulating and instructive address to the prize-takers and the younger members of the trade, for which, on the motion of the chairman, he received a cordial vote of thanks.

Sir Jas. Russell, M.D, presided over the annual meeting o the East of Scotland District Council held in Edinburgh. The chairman, in moving the adoption of the report, said that they had now recognised for some years that to render the move ment effective and to secure for the public the benefit it was calculated to give them, registration was necessary It was not intended to compel anyone to come into the movement, bu it was felt to be absolutely necessary that those who came under a guarantee of competency and discipline should have their status marked out by Parliamentary imprimatur. Bailie Pollard, in seconding the motion, said that in public-health matters things had greatly improved during the last forty years, and the plumbing trade had made a great advance. There was a great deal less misery, sickness and death now than there was forty years ago, simply through the improve ment that had taken place in the plumbing trade. There was a spirit of scientific application to work in the plumbing trade now which used not to prevail, and it was fruitful of most excellent results to all classes of the community.

* Afterwards the firm declined the contract.

Mr. E. A. Sandford-Fawcett, of the Local Governm Board, conducted an inquiry at the Huddersfield Town H relative to the application of the Corporation of that borou for power to borrow 50,000*l.* for electric-lighting purpos The Town Clerk (Mr. F. C. Lloyd) mentioned that the bala of loans under the Sanitary Acts was 88,815*l.*, all in respect electric lighting. Some of the machinery which would have be paid for out of the proposed loan had already been order because they had to wait so long for delivery, but no payme had been made. The annual rent of the land on which electric-lighting station stands was 315*l.* 15*s.* 8*d.* Alderm Calvert, the chairman of the electric-lighting committee, plained that the reason of the application was the rapid increa in the number of consumers. They had had recently decline a number of applications because they had not necessary plant and no further money to spend. The profit the undertaking during the year ended December 31, 18 was 2,437*l.* 1*s.* 3*d.*, and the whole of this amount was tra ferred to depreciation and contingencies fund.

Vol. LX. of THE ARCHITECT. Handsomely Bound in Cloth, Price 12s. 6d. Office: Imperial Buildings, Ludgate Circu E

TRADE NOTES.

MESSRS. MELLOWES & CO., of Sheffield and London, have recently completed the roof glazing of the new S.E. station at Maidstone and also new S.E. station at Addiscombe Road on their Eclipse imperishable system.

THE new schools, Mold, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Kilpedder and Graystones Presbyterian church, co. Wicklow, at present in course of erection (Mr. H. J. Lundy, architect, Dublin), is being ventilated by means of Mackay's patent direct-acting invisible roof ventilators, manufactured by the sole makers, Cousland and Mackay, 150 Hope Street, Glasgow.

IN the early days of the typewriter prejudice in official circles against its use was extreme, notwithstanding the undoubted advantages to be derived from it. The appearance, however, of the elegant, light and compact Yōst, with its beautiful characters and wonderful ink-pad, was the signal for the abolition of this adverse feeling. Shortly after it was put on the English market it was adopted by the Emperor William, the King of Wurtemberg, the Emperor of Austria, the Duke and Duchess of York, and many other members of royalty and aristocracy. The latest addition to the list of eminent users of the Yōst typewriter is President Loubet, who is loud in his praises of its efficiency.

THE thirty-seventh general meeting of the shareholders of the London and Lancashire Fire Insurance Company was held on the 27th ult., when the annual statement and balance sheet for the year ending December 31, 1898, were submitted. The net premium income amounted to 836,497*l.*, the profit on the working of the business to 35,016*l.* and the interest on investments to 37,529*l.* The total surplus on the year's operations was consequently 72,545*l.* Out of this amount a dividend (including the interim already distributed) of 12*s.* per share has been declared, and the remaining balance of 21,485*l.* is added to the reserve funds, which, together with the paid-up capital of the company, now amount to 1,207,480*l.*

A SMALL hospital is to be erected at Gummerfield, Stocket, by the Aberdeen County Council. The cost will be 3,619*l.*

BUILDING AND BUILDERS.

A BUILDING to serve as a branch of the Bank of Ireland is to be constructed at the corner of Anne Street and Oxford Street, Belfast, at a cost of about 11,000*l.*

THE Warwickshire County Council have decided to erect six cottages for constables to be built on part of the land adjoining the Erdington police station, at an estimated cost of 1,470*l.*

ON Monday the members of the Amalgamated Society of Carpenters and Joiners in Ludlow came out on strike for an increase of wages. The strike affects all the builders, &c., in the town.

DISTRICT offices are to be erected in Hamilton for the Lanark County Council. A site having a frontage of 135 feet will be required, of which a part will be obtained by using ground occupied by the existing police buildings.

MR. JAMES OSBORNE, contractor, Ayr, is to complete the scheme for supplying the villages and outlying farms with pure water from the Loss Burn, on the Ochils, for the sum of 8,996*l.* 4*s.* 9*d.*

THE masons of Perth lately made application for an increase of ½*d.* per hour on the present rate of wages, which are 8½*d.* and 9½*d.* an hour. The employers have declined to accede the demand, and it is thought that the men will resolve on a strike.

THE foundation-stone of the new Phillips Memorial Homœopathic Hospital, at Bromley, was laid on Saturday. The estimated cost of the building is about 6,000*l.*, towards which about 4,000*l.* has been collected.

THE Stockton joiners have accepted the master-builders' offer for a settlement of the dispute, namely, ¼*d.* per hour advance, subject to the condition that a conference be arranged, with a view to drawing up a scheme to establish uniformity of conditions in Middlesbrough, Stockton, Thornaby and Hartlepool.

THE committee of the Leeds Builders' Exchange Club have leased new and more commodious premises in the new block of buildings opposite the Corn Exchange. Since the establishment of the club some six or seven years ago the membership has steadily increased until at the present it has reached considerably over 300.

IT is intended to enlarge the church of St. Katharine's, Milford Haven, which was built about 100 years ago by the great Lord Nelson, to whose memory a stone is erected inside

the church. The enlargement will consist of an extension of the chancel to a distance of 40 feet. The expenditure will amount to about 2,300*l.*, exclusive of a new vicarage, which is also to be erected at a cost of 1,100*l.*

A BLOCK of twenty-two cottages will shortly be built by the improvement and buildings committee of the Manchester Corporation at Miles Platting at a cost of 4,872*l.* The City Council is recommended by the committee to make application to the Local Government Board for their sanction to a scheme for providing forty new dwelling-houses upon land in Miles Platting, for the accommodation of persons of the labouring class who will be displaced by the making of the new street from the junction of Long Millgate and Ashley Lane to Charter Street, and to the borrowing by the Corporation of the sum of 10,000*l.* for this purpose.

VARIETIES.

THE Great Eastern Railway Company have always been endeavouring to facilitate communication between the British Isles and the Continent, and this year, improbable as it may seem, they hve improved upon their continental service. The Harwich route is now the shortest to Berlin and North Germany. The new route will bring more prominently before tourists than hitherto some Dutch towns of considerable interest. By the completion of a new railway skirting Rotterdam it is no longer necessary for the North German express to touch Amsterdam, but enabling it to run *via* Rotterdam, Gouda, Utrecht, Amersfoort, Deventer to Oldenzaal, the Dutch frontier town, and thence on to Bentheim, Rheine, &c. In conjunction with the service greatly improved connections have been inaugurated to other parts of the Continent.

A NEW chain of office, which is to cost 200*l.*, and a badge, which is to be a blaze of diamonds and artistically enamelled, to cost 400*l.* more, will be provided for the Lord Provost of Edinburgh. Four firms of manufacturing jewellers are competing for the work.

THE Carpenters' Company purpose holding their annual examination in carpentry and joinery at the hall, London Wall, on Wednesday, June 14, and the three following days. Certificates and medals will be awarded to the successful candidates. Lectures on the subjects treated in the examinations will be given on Thursday evenings during May, and on Thursday, June 1.

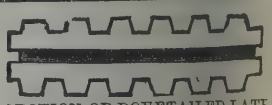
A PROVISIONAL agreement has been entered into for the purchase by the Manchester Corporation of a site for a new chief fire station within a short distance of Stevenson Square. It adjoins the Newton Street police station. The area to be acquired is 814 square yards, and is bounded by Hilton Street, Newton Street, Bradley's Court and Little Lever Street. It is covered at present with cottage property. The purchase is subject to the approval of the Local Government Board.

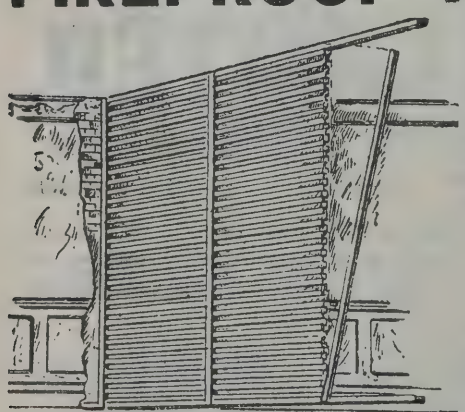
ELECTRIC NOTES.

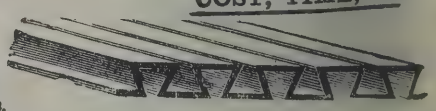
THE electric light will shortly be installed in the Memorial Hall, Farringdon Street.

THE District Council of Ilfracombe have decided to light the town with the aid of electricity, and to carry out the work without a contractor.

AT Blackpool the year's receipts from the electric lighting was 15,580*l.*, expenses 8,044*l.*, gross profits 7,464*l.*, interest 5,324*l.*, available balance 2,140*l.* In view of the expenditure upon new cables three years ago the charges for electric light could not be reduced.







PROFESSOR KENNEDY has prepared plans and specifications for the electric lighting of the new pavilion of the Edinburgh Royal Infirmary. He has informed the managers that he does not intend to accept any fees for his labours.

THE Corporation of Newcastle-on-Tyne intend to engage an electrical engineer to advise them and prepare the necessary plans and specifications in connection with the overhead system of electric traction for the new tramways.

THE Bradford Council have modified the charges for supply to electric motors. Consumers who engage to use current continuously through the day hours are to be charged only 1*d.* per unit, instead of 2½*d.*, as previously. A "unit" is the equivalent of 1¼ horse-power for one hour. Thus a consumer may have current equal to 5 horse-power for 4*d.* per hour.

THE Leamington Town Council have been informed that the Board of Trade are prepared, under certain conditions, to grant a provisional order for the lighting of the borough. The conditions, which are now under discussion by the electric-lighting committee, have, it is understood, reference to the rights of the Midland Electric-Lighting Company, which for many years has been supplying light in the borough under an agreement with the Corporation.

ELECTRIC LIGHT FITTINGS
CHANDELIERS, BRACKETS, CANDELABRA, &c.
HIGHEST CLASS
To SUIT ALL STYLES of DECORATION.

A SPECIAL meeting of the Exmouth Council was held on the 20th ult., when Mr. F. H. Taylor, of the firm of Messrs. Taylor & Field, consulting electrical engineers, of Westminster, attended. After going into the advantages the town possessed for electric lighting, Mr. Taylor suggested a small installation for say 2,000 to 3,000 lamps. A special committee of the entire Council is dealing with the matter.

THE tramway committee of the Liverpool Corporation recently decided to extend the electric system of trams to other parts of the city. Following on that decision tenders were invited for a large supply of cars, and these have now been adjudicated upon by the committee. On the experimental line the committee have had an opportunity of judging as to the efficiency of both German and American cars, and it is a significant circumstance that the extensive order for new electric trams is to be placed with an English company. The successful tenderers are Messrs. Dick, Kerr & Co., Limited, of London, who are to supply eighty electric cars at a cost of 490*l.* each. The total amount involved in the contract is thus 39,200*l.*

AT the annual and bi-monthly meeting of the Dawlish Council, the question of the electric lighting of the town was brought up. Mr. Taylor, of Messrs. Taylor & Field, electrical engineers, of Westminster, attended. In view of the high price of gas and other local circumstances, he considered that an electricity scheme had a good future before it.

ACCORDING to the *Bristol Mercury*, the electric-light committee of the Corporation have resolved upon a new departure in taking continuous current right through Bristol. The mains will be taken through the central streets so that any one on the route of the mains will be able to secure a supply of power at a moderate cost, and from the electric committee point of view this will provide a day load, which the committee have been anxious to obtain. Already applications have been received, and at the Royal Hotel, College Green, the directors are going to put up a passenger-lift in the well of the large staircase, to be designed by Messrs. Waygood & Co., and erected under the superintendence of Mr. Frank Wills, the architect. This lift will be worked by the electric continuous current. It was stated that the committee's customers for all purposes have now reached a total of 1,000, and the number of incandescent lamps is close on 70,000, irrespective of arc lamps for street lighting. Cardiff is just considering the desirability of following the example of Bristol in this respect.

THE BUILDING TRADES EXHIBITION.

EXIGENCIES of space and the brief time at our disposal prevented our noticing in our last issue all the exhibits at this thoroughly interesting and comprehensive display, into which nothing of an irrelevant nature has been admitted, and where it is perhaps not too much to say everything is good of its kind.

Some particularly interesting exhibits are to be found in the gallery. The principal credit, we are informed, is due to our enterprising contemporary, *The Surveyor*, which has certainly been instrumental to a great extent in the success of this part of the exhibition. Most of the exhibits here are of stone, road-paving and similar classes of materials. We were particularly struck with an exhibit of

The Hard York Patent Stone Company.

This firm, whose works are at Lightcliffe, near Halifax, have an interesting exhibit of their new patent "Non-slip" stone which should be of interest to all engaged in the building trades, as the uses to which it can be put in all building operations seem to be unlimited. We cannot do better than enumerate some of the many advantages we think are justly claimed for it. It affords a perfect foot-hold, and does not under stress of wear and under any circumstances become slippery. It copes and works like natural stone. Being made under hydraulic pressure of over 1,000 tons it does not laminate like natural stone. It presents a surface equal to that of a polished flag and a natural stone-like appearance. It contains no air cavities, is non-porous and frost-proof. It will wear alike through the entire depth of slab. These results have been achieved by imitating nature. In the process of manufacture she subjects her materials to great pressure and binds them together. In the manufacture of the "Non-slip" stone the "Silex" chippings are reduced to fine particles, perfectly mixed with various patented ingredients, and the slip run into 3-inch moulds, then put under hydraulic pressure of over 1,000 tons, thus preventing warping or twisting of the stones while maturing. The surplus water is expressed; the action of the ingredients quickened and enhanced, all air cavities eliminated, and a perfectly solid slab 2¼ inches thick, of several sizes, produced. Throughout the whole process of manufacture special patent machinery is used—the stone being thoroughly broken and ground to

"MARPEDO"
GOLD MEDAL, 1896.
THE PERFECT SANITARY WASHABLE WATER PAINT.

Is prepared in Artistic Shades which do not fade. It is Cheaper and Healthier than Wall-Paper, and is largely used for the Interior and Exterior Decorations of Mansions, Churches, Schools, Hospitals, Railway Stations, Stables, Kennels, Farm Buildings, &c.

MARPEDO PETRIFYING LIQUID for Damp Walls. MARPEDO RED, a perfect substitute for Vermilion (at half price).

THE MARPEDO COMPOUND PAINT CO., MINSTER MILLS, READING.

NOTICE OF REMOVAL.

During the Rebuilding of the Strand Premises, which have been occupied by "THE ARCHITECT" for the last 30 years, the Editorial, Publishing, and Advertisement Departments have been removed to

Imperial Buildings, Ludgate Circus, London, E.C.

even texture, and automatically mixed in proper proportions. The "Non-slip" stone is admirably suitable for window and door heads, sills, jambs and mullions, square and moulded steps, landings, coping, water tabling, decorative panels, or any purpose for which an artificial stone can be used. We see many thousand yards have been laid in the principal thoroughfares in the most important cities and towns throughout the country, and it is greatly in demand both for durability and its other qualities. A great quantity has been supplied for several large and important Government buildings in different parts of the country; in districts where a good sound substitute for natural stone is required nothing better can be used, and judging from the interest shown in their stand we feel confident it is worthy of the attention of all users of natural hard York stone either for footway pavings, steps, landings, &c.

The Norton Stone and Concrete Co.

The Norton stone is a hard artificial stone of fine texture and a good grey colour, and examples are here exhibited of the various architectural and building uses to which it can be applied. Among these we see window and door sills, and jambs, columns and pilasters with their respective caps, corbels, cornices, string-courses, chimney-pieces, steps, kerbs, flags, &c. This stone, as we have said, is hard and of fine texture, moulds well and is extremely durable, as is testified by an experience of some twenty-five years. The specimens shown here are all marked in plain figures, and these are marvellously low. The works of the company, of which Mr. John Burn is the manager, are at West Hartlepool, Norton, Stockton-on-Tees, and Eagles' Cliff. The Norton Stone and Concrete Co. are manufacturers of all kinds of concrete work either cast or *in situ*, including fireproof flooring, footpath pavement, steps, landings, sills, mantels, and every description of architectural work. The works have recently been very much extended, so as to enable the company to keep pace with the ever increasing demand for the goods; this perhaps is the best evidence that the greatest care is exercised in the selection of the materials and in ensuring accuracy in manufacture.

The Owen Stone Company, Limited.

The Owen Stone Company, to the high quality of whose artificial sandstone we had the pleasure of referring on the occasion of the inauguration of the works at Worplesdon, Surrey, some two years since, are showing some very pleasing examples of the uses to which this stone can be put. They have a pair of plain but massive gate-piers, a very richly carved mantelpiece and panel, a memorial stone, &c., as well as some blocks of the stone wrought and unwrought. The Owen stone is of pleasing colour and texture, is easily worked when new, but hardens rapidly with age, and consequently should prove very durable.

Stripso.

This is a preparation for removing paint or varnish, or both, from wood or other material. It will also effect the not easy task of removing smoke-stains from marble; in short, its detergent qualities seem to be as varied as they are powerful. Stripso is easily used. It is simply laid on the wood and washed off after a few hours, when the wood will be ready for fresh treatment. Stripso was shown by Mr. Evan Davies, of Fowke's Buildings, Great Tower Street, E.C.

The Nottingham Patents Company.

Several useful patents were shown by this company. One of them was Norris's patent chimney-pot for the prevention of down-draughts, and consequently smoking chimneys. Then there is an inspection and test-pipe for drains, which is a simple and effective contrivance, while also for drains is a patent air-inlet valve, which, like all the devices that are shown by the Nottingham Patents Company, display considerable inventive skill, as well as regard for usefulness.

Beck's Door Check, Limited.

The device shown by this company is one of considerable ingenuity, and would be of service under many different conditions. It is shown in three forms. That marked "A" is for doors which open one way only; "B" is for doors opening both ways, and "C" is a combined check and closer. One useful point in connection with these springs is that the door may be regulated to remain open at any angle. They are all of them clever inventions, easily attached, and presenting no protuberance of any kind anywhere.

The Italian Artistic Tile Company.

The wares exhibited by this firm, whose stand is in the Gallery No. 3, are such as would afford pleasure to the most fastidious artistic eye, prominent among them being their *gris flammé* architectural details in terra-cotta, the peculiarly quaint rich and artistic effects of which are produced—as their name

THE PLEIADES OF PROGRESS.

EDRAL SERIES.—DURHAM: ANCIENT FONT, WITH CANOPY.

ST. AUGUSTINE, PENDLEBURY.

SHIPLAKE COURT, HENLEY-ON-THAMES.

s—by a special method of firing. No colouring matter d, but by this process the clay acquires a beautiful red green effect very suggestive of the patina of a choice e—an effect which is heightened by the very low glaze it takes. Specimens of this ware in panels, keystones, re shown, and their suitability to architectural decoration r obvious. We may, moreover, mention that in the build- hich gained this year's premier architectural prize in this material was largely used with charming effect. The re also showing excellent samples of their *cloissonné* tiles utiful designs. The most noticeable feature about them vever, the remarkable beauty of the glaze, which is quite ional. It does not craze and is of perfect colour. Glazed cotta, balustrades, mosaic, &c., are also on view here.

H. Herrmann, Limited.

is characteristic of this company, their stand again pre- in appearance of artistic continence and refinement which too rarely observed on this side of the Channel. On delicately carved easels of the Gothic, Renaissance and XV. periods respectively are exhibited a small series of panels of exceptional grace and refinement both of and finish. These are all executed by hand. We have eral occasions had reason to speak of the excellence of rving executed by this company from the designs of cts and others, but the art work here shown is a new ure to which they are devoting great attention, and sly with very gratifying results.

Walter J. Pearce.

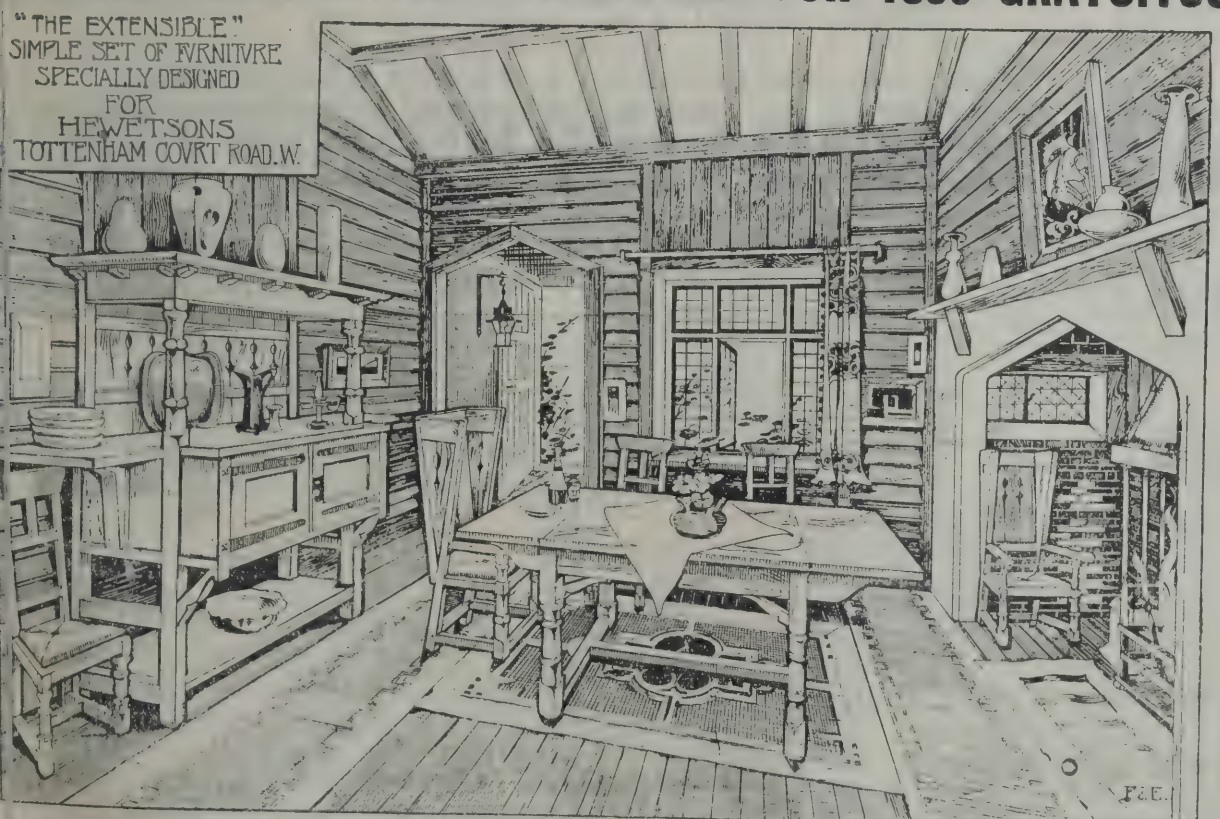
Pearce shows some brilliant effects in modern leaded and stained-glass, the beautifully decorative effects of are produced by the artistic mingling of plain, cathedral, or painted and American and Venetian opalescent All these varieties do not necessarily appear in any one specimen, but by their judicious combination and the elegant and artistic designs employed very excellent results, embodying charming effects of light and shade, are obtained.

Messrs. Foy, Morgan & Co.,

Of Bishopsgate Street Within, as agents for the Canning Jarrah Timber Company, have an interesting display of goods made out of Jarrah, which wood has hitherto been chiefly employed in this country for paving purposes only, but the adaptability of it for such superior purposes as mouldings, skirtings, flooring, handrails and balustrades, is emphasised in a remarkable degree by the numerous exhibits here, which comprise in addition a model staircase, an artistic mantelpiece and an exceedingly fine carved panel, besides various small objects in the natural as well as polished state. As agents for the Kauri Timber Company (New Zealand), Messrs. Foy, Morgan & Co. also exhibit several polished panels of Kauri pine of considerable width and entirely free from knots, in addition to a fine carved figure-head framed and a variety of specimens of moulding in different patterns, matchboards, balusters and other turnery work, all of which present a creditable appearance.

Ashton & Green.

This firm's stand, which is in the north-east corner of the gallery, contains a handsome variety of marble, slate and wood chimneypieces, stoves, tiles, kitchen ranges in operation, baths, castings, and sanitary goods generally. If we are not in error, the principal novelty is A. & G.'s heating and ventilating stove, which is being made for and supplied to the offices of H.M. Government, and which presents a handsome, comfortable and substantial appearance.



Wade Disinfectant Syndicate.

The syndicate are exhibiting their patent self-acting Government disinfector for use in water-closets, urinals, &c., also in road-watering vans, ensuring a uniform supply of disinfectant. The syndicate appear to have a fair show of reason in claiming that this is a hygienic protection, practically securing the user an immunity from typhoid, diphtheria, and other diseases due to drains.

E. S. Hindley.

The engines and machinery for which this maker is so well known are not largely represented here. He is, however, showing under the south gallery a steam saw bench and a couple of engines of powerful appearance and beautiful finish.

C. A. Zadig & Co.

The adjoining space is occupied by this firm, which have sent a portable railway, some portable side steel tipping waggons, &c.

Ames-Crosta Sanitary Engineering Company.

At stand 73, row D, are shown Crosta's patent surface-water gullies, which are being extensively used by the London vestries and boards of works, the cities of Liverpool, Birmingham, Nottingham, Belfast, &c., the Isle of Man Commissioners, the borough of Windsor, and by health resorts, corporations, railway companies and urban and rural authorities of Great Britain and Ireland, and in the approaches to numerous important buildings, including the Hôtel Cecil, London, the Hôtel Métropole, Folkestone, &c.; Ames & Crosta's patent self-adjusting pipe-joint, for which the following advantage, among many others, is claimed: perfectly sound gas and water-tight joints, which will stand pressure, can be quickly made by ordinary workmen under all conditions with clay and cement, which are the cheapest and most reliable jointing materials; and Ames's improved manhole cover, which is a deep cover with reduced contact between cover and frame, thus preventing the former from corroding fast in the frame. A shallow seating is provided, the cover from the seating being set back clear of the frame and carried down the full depth of the frame, with a flange on the bottom coming in contact with it.

Wm. Brown.

Mr. William Brown—the bricklayer steeplejack—is quite a celebrity in Lancashire, whence he hails. He is credited with having ascended more steeples, spires and factory chimneys than any competitor. He is exhibiting here all kinds of apparatus necessary for his difficult and dangerous avocation, models of mill chimneys (laddered and staged), apparatus for use in connection with lightning conductors, weather-cocks, &c., and other interesting paraphernalia.

George Jennings.

Mr. Jennings has a large and representative selection of the improved sanitary and building appliances for the excellence of which he has a well-established reputation. We did not notice anything sufficiently novel to require special description, but each object is of its kind excellent, and the kinds are numerous, as baths and bath valves, water-closets, lavatories, sinks, urinals, warm fresh air ventilating grates and stoves, air-bricks, bounding bricks, stoneware drain-pipes, damp r courses, grease-traps, yard sinks, syphons, and every de tion of stoneware and terra-cotta goods.

Somerset Trading Company, Limited.

A small roof has been constructed by this company to h the application of their new method. Roofing and plain barges, hips and valleys, patent "Rainbar" tiles, finials, courses, machine-made ridge tiles, &c., are also shown.

Oates & Green.

Messrs. Oates & Green have an excellent exhibit of sa ware, the specimens shown including their white or salt- Taper urinal, which is made in one piece and has no cr in which dirt, &c., can accumulate. It is also of ver appearance and should for various reasons "catch on." firm's combined water-closet and tipper box is also sho well as the patent Kroyvert waste water-closet, rang latrines, a collection of channel syphons, white, cream, an glaze lavatories with stands; white, coloured, salt and m bricks, &c.

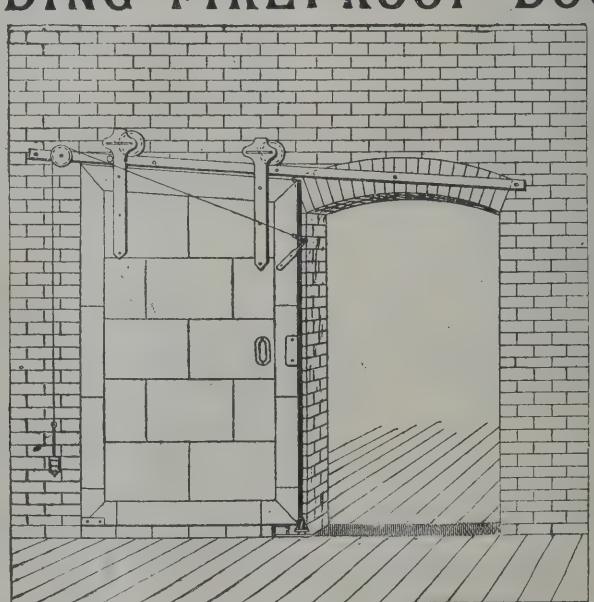
Mark Gentry.

Mr. Gentry always has a good show here, and this tion is no exception to the rule. His "M. G." brand facing bricks, rubbers, arch bricks, moulded and en bricks, panels, tablets, &c., are of remarkable richnes uniformity of colour, and the designs of his ornamental are very clear and sharp.

Rockhill Bros.

The "Rockhill" patent hot-air stove shown by M Rockhill has a handsome and comfortable appearance. a hot-air setting entirely constructed of fire-bricks, no iro whatever other than C. I. front. The bricks used are m and made for the special purpose of constructing these which are guaranteed to heat 10,000 cubic feet of air, a effect a great saving of fuel.

Petrifite.



Considering the unpromising materials from whi material is made, it is astonishing to see the results ob Specimens are here shown of the uses to which it c applied, uses as various as internal brick and lath wo inflammable floors laid in monolith, which are said cheaper than wood floors, steps and balustrades, im marble (and a good imitation, too) pedestals, table-top many other things useful and ornamental.

Sissons Bros. & Co., Limited.

e made reference a week or two since to the utility and ibility of Hall's patent "Sanitary Washable Distemper." at stand 15, row A, may be seen a model of a villa ted both internally and externally with the distemper. It d in various appropriate colours for ceilings, cornices, walls and dados, and for stencilling or hand-painting. os of the latter, two artistically executed groups of flowers own which conclusively prove with what facility the per can be worked.

Joseph Wedgwood & Sons, Limited.

ssrs. Wedgwood have erected a pavilion which forms an ive feature of the exhibition, decorated as it is, both e and inside, with glazed tiles of excellent design and In the interior is a complete decoration for a room in Adams" style, entirely ceramic, treated in four tones of which at once convinces one that tile decoration can be restful enough for ordinary living rooms." With this is iced with pleasing effect original jasper plaques, having ts upon them modelled by such great masters as Flax- Tassie, Hackwood, &c. Their beauty needs no descrip- This style of decoration is particularly suitable for hall, ng or billiard rooms in private houses. A notable e of the room is the handsome oak mantel, into the portion of which is inserted a beautiful jasper frieze enting the "Twelve Dancing Hours following Aurora" he original models of Flaxman, and another in the lower n, the subject of which is "The Nine Muses," also ne original moulds. There are also a collection of vases, ens of all classes of tiles for walls, floors, &c.

Ventura Syndicate, Limited.

e Ventura Syndicate are manufacturers of Hitchen's machine-made "Fibrous Plaster Slabs," specimens of they exhibit. The advantages which are claimed for aterial are that lathing is dispensed with, the rapidity hich houses may be made habitable, the absence of dust t, which always accompanies lath and plastering, and ed sanitary conditions, as the slabs are perfectly sanitary , and they can be fixed on stud walls, close down to the g, upon which the skirting can be nailed without any g out, thus leaving no room behind to allow vermin to or dust to accumulate, as there is with most old- ed plastering.

Ewart & Sons.

At stand 27, row A, Messrs. Ewart have a representative show of their baths, geysers and boilers for baths, &c., and a series of their well-known ventilators in copper and other metals.

Thos. Ash & Co.

At Messrs. Ash's stand examples are shown of their patent "acme" chimney-cowls, "acme" ventilators, air-inlet ventilators (Tobin's), &c.

B. Hainsworth.

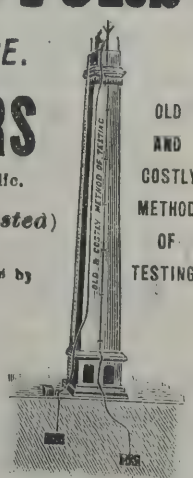
Ventilators are also shown by Mr. Hainsworth, the most noticeable being the ornamental crown X.L. single tube outlet ventilator, adapted for Gothic structures, including mansions, churches, schools, public halls, &c. It is fitted with regulating valve, which is worked by means of a cord and pulley fitted in ventilator. Plainer varieties are here also, as are inlet wall-brackets, wall-panel inlets, &c.

Lyte's Metallic Woven Stair Tread Co., Limited.

Lyte's metallic stair treads appear to possess the advantages which are claimed for them, *i.e.* security against slipping, durability and neat and ornamental appearance. They are cleanly, and the lead being woven with the steel throughout cannot work out of the wire mesh, they offer no long surfaces of metal to polish and become slippery, and can be adapted to any steps. They are inexpensive and, we understand, have been supplied to numerous public and business premises in London and the provinces.

A. C. W. Hobman & Co.

A staircase in Clifton stone, mosaic steps and landings, mosaic paving tiles, table tops, &c., are shown by Messrs. Hobman, as well as window sills, balusters, moulded cornice, and specimens of their various well-known pavements.



Cranstone Engineering Works, Limited.

This firm is represented by specimens of their quick hand hoists, pulley blocks and chains, gin blocks, hand-power warehouse lift, friction hoist, patent friction clutch, model hydraulic lift, &c.

Robert Adams.

A good display without any noticeable novelty characterises Mr. R. Adams' stand. There are the usual varieties of floor and overhead door-springs, reversible window fittings, fanlight, lantern light and skylight gear, weather-tight casements, &c.

VOLUME LX. OF THE ARCHITECT.
Handsomely bound in Cloth, Gil Lettered, price 12s. 6d.
Office: Imperial Buildings, Ludgate Circus, London, E.C.

The United Asbestos Company.

Excellent designs in high relief ceilings, friezes, &c., in asbestos, and known as the "Salamander" decorations, are contributed by this firm. As we have pointed out on several occasions, this decoration, while possessing the advantage of being fireproof, is as rich in effect as expensive plasterwork, the cost is materially less, and the work can be proceeded with with a rapidity which cannot of course be attained in plastering. We understand, too, that the prices have been further reduced.

Rowland Hodges.

The hydraulic check double-action floor-spring hinge shown by Mr. Hodges is worked by a powerful spring, the effect of which can be regulated at will by the mere turning of a screw. The door to which it is applied can by turning a nut be made so heavy as to require considerable force to open or so light as to yield to the touch of a child.

The "Dreadnought" door check and spring, for overhead fixing, is also capable of regulation in a similar manner, and possesses the advantage, in which we understand it is unique, that the door can be opened to its fullest extent—*i.e.* turned back against the wall, if necessary—without in any way interfering with the working of the spring. Fanlight gearing, indicating bolts, door furniture, cabinet and builders' brass-work, &c., are also shown.

J. C. Broadbent & Co.

Messrs. Broadbent & Co. show specimens of the different forms in which they supply their silicate cotton or slag wool, and have brought a model of a house, in which is demonstrated the ways in which it can be used for sound-proofing and preventing the spread of fire, and the stopping of radiation of heat or cold.

Thomas Potterton.

Examples are shown by Mr. Potterton of his patent ranges, boilers, safety valves, &c, and explanatory models and plans of his patent system of house-heating by means of the kitchen boiler.

Joseph Kaye & Co.

Kaye's locks, bolts, latches and handles are too well known to require any special description; they are, however, showing a little novelty in a drawer which can be locked, but cannot be unlocked, without a key. This contrivance seems simple and efficient, and should prove useful in banks and offices.

Brilliant Sign Company, Limited.

A bright and attractive display has been arranged b above company, who show a large variety of designs and in their "Brilliant" concave metal letters for fascias, stall tablets and windows, wood, brass, glass, enamel and letters, &c.

The Welsbach Incandescent Gaslight Company.

This stand forms, as usual, a brilliant and attractive po light, especially in the evening. We do not, however, anything especially new this time. The latest thing i chimneyless burner, which is made in various sizes. advantage and pleasing appearance of this has, however, its introduction had ample time to become familiar to th of the least observant.

D. Anderson & Son, Limited.

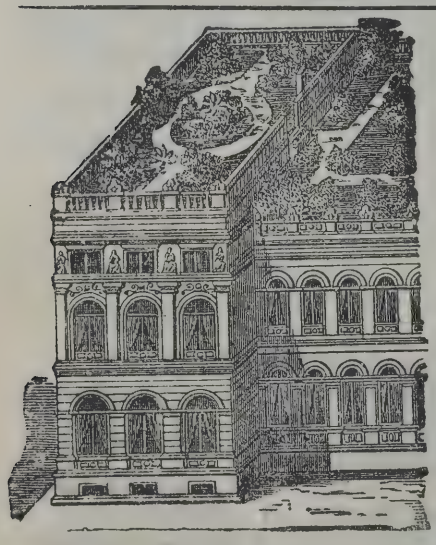
A model wooden lattice roof is shown by Messrs. And and specimens are also here (66, row D) of roofing, lining other felts; silicate cotton or slag wool in various showing its application for sound and fire proofing building insulating cold-air stores; silicate pipe cloth, for co steam and other pipes; samples and models showing Anderson's patent hair fabric, for covering hot and cold pipes and to prevent freezing, and for covering brine ammonia pipes; cow hair, plasterers' hair, &c.

M. T. Medway.

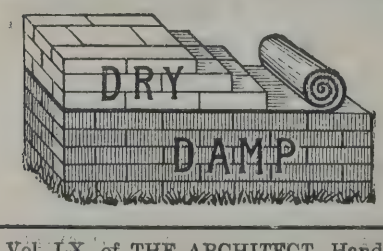
The space occupied by Mr. Medway's exhibits is, as not a large one, only dinner-lifts and hydraulic gears shown, and in these we do not notice any new features for special mention.

The London Hoist & Chain Company.

The same may be said of this firm's exhibits, which c of a selection of patent pulley-blocks and chains, quick hoists, warehouse cranes, crab winches, friction hoists, lifts, dinner and luggage lifts, and trucks.



Moule's Patent Earth Closet Company, Limited.



This company shows specimens of the well-known cl the advantages of which have been too long before the to require special comment.

G. B. Kent & Sons.

The unobtrusive glass case sent by this firm contains excellent samples of their painting and varnish brushes, tools, ground brushes, &c.

PATENT
VULCANITE ROOFIN

Since the introduction of the patent Vulcanite Roofing into this country it has bee by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter a than under any other roof. When properly laid repairs are never required, and all guaranteed. The roof-surface can be used as a garden, or for any other purpose. T construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, B TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any widt inches, being more convenient than the usual damp-course slabs, and saving laps. Price quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., **SARKING** under slates or tiles, manufactured in five different qualities and in rolls of 5 ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO.L
OLD FORD, BOW, LONDON, E.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet

Mosaic Manufacturing Company.

At stand No. 52, row B, the Mosaic Manufacturing Company, of Pentonville Road, N., are exhibiting a number of very fine samples of Roman and Venetian marble mosaic, and the original designs of many of the floors recently executed by this firm are also on view. Appropriately, too, their stand, which has been formed so as to give a pathway from rows to A, is paved with Roman mosaic in black and white.

John Knowles & Co.

Immediately under the clock is the well-arranged and attractive exhibit of this firm. In the centre is a handsome portal in Ketley red brick and terra-cotta (which we understand has been sold to Messrs Gillow & Co.), flanked on either side by an extensive range of sanitary pipes and appliances, traps, interceptors, gullies, chimney-pots, varieties of the Aquarius closet—for which the following advantages are claimed: (1) That the outlet is adjustable to any position; (2) that the joint is submerged and must be perfectly sound, otherwise the water will reveal the defect; (3) that the joint is so simple that an unskilled workman can make it, and when made is actually the strongest part of closet; and (4) that it affords the easiest possible inspection. There is also a large variety of fireclay stove cheeks, fire-tiles, &c.

Broad & Co., Limited.

The patent sanitary sink is again the central feature of Messrs. Broad's stand, which, however, includes a large variety of white mounted ware in channel pipes and bends, gully and grease traps, sewer-gas interceptors and other drainage accessories. This company is also exhibiting an excellent "impermeable" drain pipe, channel pipes, bends and gully traps manufactured of cream Bristol ware. Engineering bricks, white-glazed, blue, red and stock bricks are likewise to be seen here.

Threlkeld Granite Company, Limited.

The ornamental granite tiles exhibited by this company in Row C are prepared from crushed granite and Portland cement. They are shown in various designs and colouring suitable for floors, dados, halls, &c., in public or private buildings. Some of the mosaic patterns are good, and the colours are bright. Great durability is claimed for these tiles. Granite concrete flags for paving are also shown. They are 2¼ and 2½ inches in thickness, and are suitable for footways, stables, &c.

Ernest Smith.

Mr. Ernest Smith is showing his patent iron joint for stoneware pipes and connections for main sewers and house drains, and for low-pressure water mains. An obvious advantage which is claimed for this joint is that a length of sewer can be tested immediately the last joint is made, and should a joint leak it can be made tight with a caulking tool while the sewer is under test.

Limmer Asphalte Paving Company, Limited.

This company has on view a specimen of their stabling and roofing asphalte, and samples of the materials they employ and supply, as raw mineral Montrotier Seyssel rock asphalte, mineral rock mastic asphalte, Montrotier Seyssel mastic asphalte, mineral rock asphalte powder, Montrotier Seyssel asphalte powder, refined Trinidad, mineral (Scotch) shale, refined bitumen, Bridport grit, &c.

George M. Callender & Co.

exhibit specimens of their pure bitumen damp-course, their pure bitumen sheeting, as applied to lining reservoirs, railway bridges, cellars, &c., their damp-resisting solution, and models, sections and plans in illustration.

Nottingham Patents Company.

This firm show a patent chimney-pot for preventing down and increasing up-draught, patent inspection drain-pipe, by means of which a drain can be unstopped without ground being broken, and a patent flap-valve air inlet to drains.

Crossley Bros., Limited.

The gas and oil engines exhibited by this company are sufficiently well known, so that any description at our hands may be dispensed with

William Johnson & Sons.

A model of their patent steam lever brick and tile press is shown by this firm, and a Dragon patent crusher, 9 inches by 6 inches, with Dragon steel jaws.

Kirchner & Co.

Wood-working machines are shown by this firm. Their exhibit comprises a tenoning machine, bandsaw, new four-cutter, planing and moulding machine, hand-planer, panel-planer, sash mortiser, automatic knife-grinder (24-inch emery wheel), combined spindle moulder and recessing machine, &c.

The "A.A." Reversible Window Co.,
21 Buckingham Street, Strand, W.C.

J. Sagar & Co.

Messrs. Sagar likewise show specimens of their wood-working machines, including their "Premier" planing-out-of-twist, jointing, squaring-up, moulding and thicknessing machine for hand and roller-feed (this machine will plane from one-sixteenth to 7½ inches thick, and up to 20 inches wide), and their vertical spindle moulding and shaping machine for working with cutters through the spindle in the French style, or with grooved collars and square cutter-blocks. In this machine the spindle is arranged to work right or left at option, and fitted with roller-feed gear for straight work. Their new pattern builders' power-mortising and boring machine, with compensating connecting-rods for letting the chisel gradually into the mortice by foot-lever, will take timber up to 12 inches by 5 inches, mortise up to 1¼ inch wide, and bore holes up to 1¼ inch diameter. It is fitted with self-coring chisel. Several others are also shown.

Colthurst, Symons & Co., Limited.

Plain tiles, nibbed and holed for nailing, size 10½ by 6½, are shown on a miniature roof by this company. The tiles are made under steam pressure and are of great density and strength. The company's improved interlocking Roman tiles are to be seen here too. These tiles so clip each other that it is claimed that they cannot strip in the roughest weather. Samples of plain and ornamental ridges and finials are also shown.

The Mansfield Patents Company, Limited.

The patents referred to in the name of this company are all of a sanitary nature and, according to the samples exhibited, include improved action silent cistern, flushing cisterns, radiators, &c., patent chimney-pots (Robinson's patent), improved pedestal washdown basin, "A" connection for making a gas and water tight joint to a closet outgo, "B" block for making a perfect connection between the lead soil-pipe and the drain, "C" cap for connecting lead pipes to iron soil-pipe junctions, and a sanitary iron pipe junction for connecting lead and iron soil-pipes.

G. & F. Couzens.

Messrs. Couzens do not appear to have brought any novelty up with them, their exhibit consisting as usual of sanitary fittings and appliances, including their patent ball valve interceptor and syphon ventilator intended to obviate flooded basements.

Lewis Told

has only a small show, consisting of some excellent sample of Dundry freestone from the Dundry Quarry, near Bristol.

Farnley Iron Company, Limited.

Specimens of salt-glazed bricks built into a wall are shown by this company, as well as loose bricks of the same description, coloured glazed bricks, Picking's patent twin-arch partition tiles, architectural terra-cotta in bricks, panels, &c., a glazed fireclay post-mortem table, and a large variety in glazed fireclay sanitary sinks, urinals, wash tubs, lavatory basins, water-closets, slop hoppers, channel pipes, and some excellent samples of porcelain baths.

Rowlands Castle Brick and Tile Works, Limited.

This exhibit comprises samples of the red facing bricks moulded and ornamental bricks, rubbers or cutters, roofing tiles (hand-made), ridge tiles, chimney-pots, finials and terminals, panels, diapers, pateræ, key bricks and terra-cotta work manufactured by the company.

Arthur Lee & Brothers, Limited.

The Acme patent system of slating and tiling is illustrated at this stand (109, row F). The object of this invention is to construct slating and tiling in a new and improved manner, so as to procure a better appearance and to effect a large saving of labour and material. The system consists in removing a portion of the slates or tiles at opposite corners, and of so placing the slates or tiles that a perfect lap is obtained on all sides of them. Ordinary roofing slates from the Old Bangor Slate Quarries are also shown here.

Lignomur Company.

Some handsome patterns in the wall decorations prepared by this firm are very effectively shown at their stand (51, row B). Among them are ceilings, friezes, fillings, dadoes, &c. Several advantages may be placed to the credit of this method of mural decoration. It has a bold effect, which it retains when hung. It is easily hung, has a white finish and is inexpensive, or comparatively so.

Granite Silicon Plaster Company, Limited.

Specimens of granite silicon plaster are shown at the stand of this company. This plaster, which is being largely used by H.M. Government, is reputed to dry quickly, to set exceedingly hard and not to crack in process of or after drying.

ENGLAND

MUST NOT BE BEHIND IN THE MANUFACTURE OF

JOINERY.

PARKER'S JOINERY & CABINET CO. L

Have laid down the latest *Joinery Plant*, the *only one* of its kind *in England*. Its turn-out is the largest in the Ur
Kingdom.

Builders and Contractors, before placing their orders, will find it to their advantage to communicate with the Compy
London or Birmingham Representatives, who will wait upon them and give estimates for large or small quantities of Joine
Hard or Soft Woods.

Fixing if desired will be undertaken. Society men only employed.

THE LARGEST MANUFACTURERS OF WOOD CHIMNEY-PIECES IN THE KINGDON
ESTABLISHED OVER 20 YEARS.

T. W. Palmer & Co.

The specialties of this firm consist of unclimbable iron railings and entrance gates, garden hurdles, galvanised cisterns, troughs, hay racks, &c, wire fencing of various kinds, galvanised iron fencing and steel palings, of all of which good samples are shown by them.

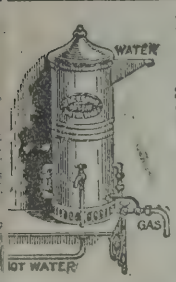
The Valveless Syphon Company

show flushing cisterns and ball taps, the "Waterwitch" horizontal syphon cistern, the Neptune vertical syphon cistern, the Kirkstall syphon valve cistern and the "Waterwitch" ball tap.

Candy & Co.

Messrs. Candy & Co., whose goods are well known, have an excellent and comprehensive show near the centre of the hall, where they exhibit capital specimens of white and coloured glazed bricks, stoneware sanitary pipes and fittings, buff terra-cotta facing bricks, architectural terra-cotta, fire bricks, lumps and tiles, garden vases and tiles, edging tiles, buff chimney-tops, salt-glazed bricks, ventilating bricks, engineering bricks and channels. Messrs. Candy & Co. make rather a specialty of their granite vitrified paving-bricks, which are made from granitic clays. For these bricks the following advantages are, and as it seems justly, claimed :—They are bright in appearance and, being impervious, are washed clean by every shower which falls upon them ; they resist a crushing strain of 445 tons to the foot ; they are damp and frost proof, and are vitrified throughout. At the same time they are, we are informed, cheaper than any other permanent paving in the market. Some of these bricks were laid over twelve years since in Leadenhall Street by permission of Colonel Haywood, C.E., and although about 30,000 persons pass daily over them, they are said to show no signs of wear. They are largely in use for footways, sidewalks, terraces, promenades, markets, wharves, stables, &c, and, from a sanitary point of view, should be valuable for stables, as they are not affected by uric acid and will not hold contagion. On account of the sharp points of infusible silica contained in the granitic clays, this paving does not become slippery in wear.

Mejer, Greenwood & Sons, Limited.

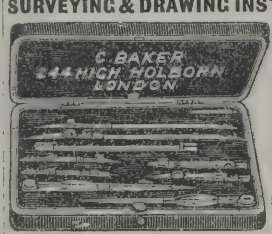


The object of Messrs. Mejer, Greenwood and Sons' exhibit is to illustrate the merits of "Vernoline," a water-paint which is thoroughly washable, sanitary and odourless, and dries quickly with a flat finish The walls of the stand (48, row B) are covered with decorations in various styles, among them being a figure panel which was executed three years ago, and of which the colours are as fresh as when applied, notwithstanding that, as we are assured, it has been washed several times with soap and water, to say nothing of the innumerable applications of wet sponge at exhibitions, and so forth. We may add that the colours are numerous and good and the cost small.

"Gasorcoal" Stove.

The exhibition displays many examples of improvement in the multitudinous details appertaining to the science of building, but to our minds no more surprising thing is shown than the specimen of the Gasorcoal stove at stand 92A, row E. The object of the stove is aptly described in its appropriate title, but it must be seen to properly appreciate the remarkably simple and practicable manner with which its object of combining the convenience of both a coal fire and a gas fire in one grate has been achieved. As it appears to be capable of ready adaptation to existing fireplaces, the invention should work a revolution in domestic stoves, for it will doubtless prove a fuel economiser, and should therefore be welcomed in every household. It combines in one circular stove a gas-grate and a coal-grate placed back to back, and separated by a fire-brick of any desired shape. When used as a gas-stove it looks like any ordinary gas-stove, and when burning coal it cannot be distinguished from the usual coal-grate. After using it as a gas-fire, if it is desired to burn coal, it is only necessary to open hinged tiled cheeks and to rotate the stove sufficiently to enable the coal-grate to be brought round to the front. Apparently any desirable form of gas fire, pattern of coal-grate, chimneypiece, and any kind of hearth may be employed. The gas connection is concealed from view, and all usual sizes will shortly be obtainable from the Gasorcoal Stove Company, 159 Victoria Street, Westminster, S.W. The advantages presented by the "Gasorcoal" stove over the ordinary grate scarcely need enumeration, but in affording as it does the choice of an alternative fire in the following circumstances, it can scarcely fail to prove welcome in every room.

In bedrooms the gas stove may be temporarily lit during the morning or evening toilet, or when retiring for the night. During autumn, winter or spring the gas stove may be temporarily lit, and in case of illness a coal fire may be used all day. In the breakfast-room or dining-room (after spring cleaning or during the chills of autumn) the gas fire may be lit during meals only, while in winter the coal fire may be used daily.



In the drawing-room on "At Home" days the coal fire may

be used, and in the evenings or when unexpected callers arrive the gas stove may be lighted. It will doubtless be found of equal convenience in either the billiard-room, study, school-room, nursery or office.

As to the all-important question of cost, we see no reason why the prices of "Gasorcoal" stoves should much exceed the price of ordinary stoves; but we understand that a price list and illustrated catalogue is in course of preparation.

Joseph Brooke & Sons.

The space in the very centre of the hall is occupied by Messrs. Brooke & Sons' exhibit, where are shown on one side white and coloured glazed bricks with specialties in colours for dadoes, ornamental and moulded bricks for string courses, &c., salt-glazed bricks, majolica glazed fireplaces, white glazed porcelain baths, sinks in white, cream and brown salt glaze, white enamelled fireclay lavatories, sanitary mangers and cattle troughs, air bricks, &c. The two newest things shown by this firm are their patent "duplex" drain pipe and their patent "grip" wall-tiles. In the former, by means of a keyed juncture (into which liquid cement can be poured through an aperture in the top), a perfectly tight joint, true alignment and firm bed are secured, and the latter are of great value for renovating old walls. Their surface resembles in size and appearance that of the ordinary glazed brick of commerce. They are, however, only of the thickness of tiles, and have a dovetail-keyed back and can be attached with equal facility to old or new walls or wooden partitions. They are made in any colour and to any design. On the other side of the stand are to be seen some excellent specimens of the firm's white, hard York stone ("Silex" brand), for use in footway paving, steps, square and spandrels; landings, moulded or plain window and door heads, window sills, coping, plain or decorated panels, ridgestones, building blocks for docks, harbours, &c., platform coping, &c.

G. B. Davis.

Mr. Davis, who is patentee and manufacturer of patent stall urinals, improved "Syphonic" closets and ventilating apparatus, has a very attractive exhibit, where are shown his "wash-down" and other water-closet apparatus complete, with flushing cisterns, seats, &c.; "Tip up and lift out" and "quick waste" lavatories, with enclosures of improved and latest designs; fireclay, vitreous, porcelain enamelled and copper baths, with special gun-metal fittings; sinks with improved "quick waste" valve in gun-metal, &c.

Crown Dale Stone Company, Limited.

Specimens of Crown Dale stone are shown at stand 121, row F. This is an artificial building stone, made of silica and lime, subjected to heat and pressure, whereby a silicate of lime is formed as the matrix. These constituents are, it is said, indestructible under ordinary circumstances. The appearance of the stone is that of a fine-grained sandstone of a nice cream colour. It can be worked and carved easily, cheaply and with good results.

The Muraline Company

show samples of muraline, muraline canvas, embossed muraline crepé and other effects.

Aldous, Son & Co.

Messrs. Aldous illustrate their system of mechanical ventilation for pumping fresh and vitiated air in and out of buildings, ships, yachts, steam laundries, hospitals, breweries, coal and other mines; and their system of automatic ventilation free from down-draught, whereby any number of rooms can be ventilated by means of only one exhaust. It is suitable for all kinds of buildings. They also show a patent exhaust ceiling ventilator for single rooms, and a patent exhaust for soil pipes, &c.

Randall Bros.

Messrs Randall Bros. (The Copal Varnish Company, Limited) are exhibiting Anaglypta panels decorated with their well-known enamel in various colours, including their "Paris white." They also show varnishes and specialties for all descriptions of decoration.

C. W. Outram & Co.

As sole makers of the "Aquarius" closet, to the manifold advantages of which we referred in our notice of Messrs Knowles's exhibit, Messrs. Outram & Co. show specimens of this, together with varieties in lavatory basins, cisterns, seats, brackets, cast-iron lavatory brackets, &c. Messrs. Outram & Co. are also makers of the "Florina" lavatory, and the "Grovina" L.C.C. pan and trap, which gives a thoroughly effective and water-tight joint, &c.

Geo. Howson & Sons, Limited.

Messrs. Howson & Sons exhibit specimens of their sanitary earthenware and fireclay goods, including water-closets, sinks, lavatory basins, urinals, wash-tubs, &c.

Rustless Iron Company.

In the gallery are shown specimens of the Rustless Iron Company's "Trico" furnace-pans, air-bricks, boilers, pipes, tanks, gratings, troughs, gutters, fall-pipes, urinals, water-closet fittings and cisterns.

Incandescent Accessories and Maintenance Syndicate, Limited.

The daylight and incandescent burners and mantles of the syndicate are shown at stand 133, together with accessories, globes, patent glass chimneys, mantle protectors, mantle guards, arc lamps, the "Thrift" incandescent burner, &c.

British Luxfer Prism Syndicate.

At stand 137 (under south gallery) may be seen specimens of Luxfer window glass, Luxfer multi-prism pavement lights, fire-resisting window glass, electro-glass, ornamental glass, copper electro-glazing, &c. We have on several occasions referred to this excellent system for lighting dark interiors. Here, however, it is not possible to see it to any great advantage.

W. Gooding.

Mr. Gooding is this year to be found in the gallery (at stand, east end), where he is showing his patent "Interchangeable Rubber Stair Treads." This tread is well known, but we may remind our readers that its special feature is the use of a metallic keeper, fitted with pieces of rubber, which project above the metal and form the wearing surface, affording a perfectly firm footing under all circumstances. The rubber can be renewed when worn out.

There are other firms whose exhibits we have not yet had time to examine, and to these we shall refer in a concluding notice next week.

MATTERS ELECTRICAL AT THE BUILDING TRADES EXHIBITION.

On entering the Electrical Section of the Building Trades Exhibition one is confronted with the well-appointed stand of the Simplex Conduit Company, containing as it does an array of steel tubes, bends and fittings of all sizes and forms, the polished black enamelled tone of which cannot fail to attract attention to the stand.

Much has been written of late on the question of system of electric wiring, and it has come to be recognised that something more mechanical is necessary than wood casing for such purpose. The object of the "Simplex" conduit is to provide a system of piping which is of mechanical construction, neat in appearance, low in cost and simple to erect. Now a steel tube possesses several advantages over an ordinary iron gas barrel, it may be smaller, therefore lighter, easier to erect and less costly, and by providing an interior as well as outside enamelled surface the roughness, and therefore possible damage to the wires, is avoided in drawing in, and deterioration is prevented.

Of course it is well understood that the chief cost in the adoption of wood casing for electric wiring is not the actual material but the labour necessitated. In a good class of workmanship for the jointing and fixing, in the simplex system the lengths of piping are simply wedged into one another, or rather into connecting pieces, they being carefully made to gauge; thus no screwing with its inconvenience is necessitated as with ordinary wrought-iron tubing, and an even internal surface is assured by a shoulder in the connecting pieces to which the lengths butt.

It has been urged that a system of electric piping should be watertight, but frequently the question of internal condensation is neglected, and in an absolutely watertight system the internal condensation must collect. The simplex system is not claimed to be absolutely watertight, and in fact it may be seen from its construction that it is not so, being a rolled tube with a seam longitudinally. It is, however, less liable to internal condensation than an absolutely watertight tube, and it should be erected with the seam downwards so that any moisture may easily escape.

Another point about this system is the bending of the tubes; one would think that on attempting this with such tubing the seam would open, but it is claimed that this is not so if care be taken. To make a bend cold, say with a ½-inch tube, a ⅝-inch hole is made in a piece of 3-inch quartering, and by inserting the tubing within this and bringing steady pressure to bear, being careful that the seam is at the side, a good bend can be accomplished with a little practice without any deterioration of the tubing. Of course, large sizes of tubing must be bent hot, the tube being filled with sand. The company supply bends as well as the straight tubing, cut to various lengths; but in ordering for a certain job, one cannot be sure as to the actual lengths and bends necessary, and thus bending must be carried out to some extent on the spot. Some screwing is also necessary, as, for example, for fixing a stiff pendant or

.cket, and one is somewhat surprised that such a good ead can be made, owing to the fact that there must be some ibility or spring due to the seam; but it can be seen at the hibition that by inserting a plug into the tube while screwing, ood thread can be made

The bright polished surface of the tubing certainly lends elf to neat appearance, and it must not be imagined that it is y suitable for buried work. The system has apparently n carefully designed to comply with all the necessities of a od method of electric wiring, with its attendant details in pection boxes of neat cast-iron with steel screwed covers l junction boxes of various forms to meet all requirements. e method of reducing the size of the piping is met by a ucing nipple, which consists of a small piece of thick tube ich is forced into the larger tube; the inside having a elled edge prevents any obstruction to the drawing in of wires. Good designs of cast-iron switch and fuse boxes also available, and in order to make the system metallic oughout branch switch and fuse boxes of cast-iron are used, ebonite washer being placed between the switch and the box. Sufficient has been said to show that the system is well th the consideration of architects and builders; and when it emembered that the system has only been introduced about lve months, during which time it has been used in some o cases—well, this speaks somewhat for itself.

Amongst other matters which attract attention in the trical section is the "Lilliputian" arc lamp of the Stewart ctrical Syndicate. The ordinary Stewart enclosed arc p has already been commented on previously in these mns, and it is not necessary to say more than that it is still ntaining its reputation. With regard to the "Lilliputian," vever, it is certainly a novelty. There is practically only one ring part, the lamp is very short and light, and it burns ut twenty-five hours without retrimming. It is certainly ap and of good appearance, and on the whole it may be ected to meet the requirements of a good arc lamp for small ent.

While discussing arc lamps a new lamp might be men- ed which may be seen at the Exhibition, and has been oduced by Messrs. Julius Sax & Co. This lamp is perhaps simplest that can be designed, and from the working it ainly seems to be reliable. The mechanism consists of a ple coil and armature, arranged to act direct on the carbon lers by two cords which exert a practically constant pull ughout the entire range, the iron armature being specially shaped that this may be so. There is no clutch, clockwork, or other mechanism liable to fail, and certainly there is nothing which from all appearances can go wrong. The lamps are made series, shunt or compound wound, and the same construction of lamp works either on continuous or alternating current circuits. Both continuous and alternating current lamps may be seen working, and it was particularly noticeable that the feed was very gradual and there was a total absence of humming in the alternating lamp. The disagreeable humming in most alternating arc lamps is due to loose joints, &c., and as there are no pin joints, or, in fact, links of any description in the lamp, there can be no objectionable noise.

The same firm also show an ingenious electric water-level indicator, by which, using only two wires from the water tank, the level can be indicated in any desired place. This is certainly of great use in the case of tanks or cisterns, where, owing to any mishap, the supply of water may be shut off, and the tank be empty without it being noticed. There are also contacts which ring a bell when the level is greater or less than a certain amount; these, of course, are useful for the same purpose, but do not show how much reserve of water is in the tank at any time, as does the former one.

Mr. Henry T. Crewe exhibits a very simple automatic time-switch, which can be set to extinguish gas or electric light, or cut off water at any desired time. The extreme simplicity and cheapness of the arrangement should make it very useful for shop window lighting, where lamps are left on for advertising purposes after the shop is closed, and also for street lamps. The principle of the apparatus is simply that a weight is released, by the alarm attachment to an ordinary clock, at the time to which the alarm is set. The weight falls, being connected by a chain to the switch-handle, and opens the circuit.

The Ediswan Company is certainly in evidence with its display of fittings, which it is perhaps hardly necessary to comment upon, as the reputation of the manufacturers for excellence is world-renowned.

THE DISPUTE IN THE BUILDING TRADE.

A MEETING of master builders of Newcastle and district was held at Newcastle, at which it was reported that the ballot recently taken showed that a majority of the employers were in favour of a general lock-out of all branches unless the plasterers' dispute should be settled forthwith. On the second

question there was a majority in favour of locking out the labourers unless the disputes at Gateshead, Sunderland and Middlesbrough were settled. It was resolved, however, that the vote should remain inoperative until after the adjourned meeting of the council of the National Association of Master Builders. Our Birmingham correspondent telegraphs that the plasterers' strike in that city is at an end, and at a largely-attended meeting it was reported that the whole of the 178 men who were originally locked out had returned to work. In several instances it was stated that architects had made requests to the operatives' association that men should be allowed to work for them instead of for the builders, and this was permitted, though it was asserted that the master builders were cognisant of and connived at what was done. As a consequence of this action other employers who had adhered to the decision of the Master Builders' Association had sent for their plasterers back again, and had severed their connection with the employers' organisation. A resolution was passed requesting the executive council to issue a manifesto describing the true facts of the dispute, as these had been misrepresented by the employers. The resolution passed by the employers' conference on Thursday was characterised as "bluff," and it was asserted that it would have no effect.

SCOTTISH BUILDING TRADES FEDERATION.

THE half-yearly meeting of the Federation has been held in Dundee, Mr James Leslie, builder, Aberdeen, president, in the chair. There was a large attendance of members from all parts of the country, the following places being represented, viz.:—Glasgow, Edinburgh, Dundee, Aberdeen, Paisley, Perth, Inverness, Arbroath, Falkirk, Hamilton, Dumfries, Peterhead, St Andrews, Stirling, Kilmarnock, Dunfermline. Before proceeding to business the members were kindly entertained to lunch by the Dundee Association. The report of the executive for the past six months was submitted by the secretary, Mr. James L. Selkirk, and dealt fully with the various important matters which had been under consideration, besides narrating the progress made in various directions which had increased the strength and efficiency of the Federation. Efforts continued to be put forth in the direction of organising employers connected with the various branches of the building trades in those towns and districts not hitherto reached. There was a growing conviction of the great importance of thorough union among members of the building trade without which, indeed, it would be difficult to maintain their position as one of the most important industries in the country. Reference was made to the fact that the question of securing a just and equitable set of conditions of contract is at present under the consideration of the Glasgow Institute of Architects, and a hope was expressed that a satisfactory arrangement might ere long be arrived at. The monthly organ of the Federation had now reached its seventh number, and had been received everywhere with the utmost heartiness, reaching, as it did, not only members, but a wide circle beyond. Reference was also made to the Workmen's Compensation Act, 1897, and the belief was entertained that the rates charged by the insurance companies would in consequence be somewhat modified. As the result of a correspondence with the National Association of Master Builders of Great Britain and Ireland, it was resolved to promote in every suitable way closer relations between the two organisations, believing that such a course would be for mutual advantage. With a view to carrying out the various operations of the Federation with still greater efficiency an emergency committee was nominated to co-operate with the secretary and advise with him pending a meeting of the executive. Several other matters thereafter engaged the attention of the Federation.

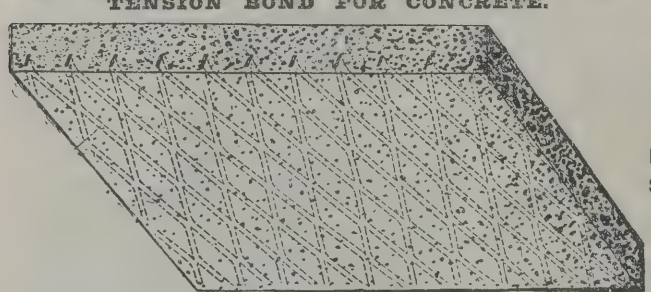
THE NOTTS LUNATIC ASYLUM.

THE lunatic asylum building committee of the Nottingham County Council reported at their last meeting that the work of getting out the foundations of the new asylum was progressing satisfactorily, and would shortly be completed. At the meeting of the Council in January last the committee reported that they had paid two sums of 1,000*l.* each to the contractors upon the certificate of the architects. The committee had passed a further cheque for 1,000*l.*, which would be presented to the Council that day, and would be handed over to the contractors upon the architects certifying that it was due. The committee had also passed a cheque for 60*l.* in favour of the county surveyor, to meet the salary of the clerk of the works during the ensuing quarter, and a cheque for 46*l.* for farm expenses during that period. At the meeting of the Council in January last the committee were authorised to obtain tenders for the superstructure of the new building from selected firms. The

THE PROBLEM SOLVED.

ORDINARY WOOD RENDERED FIRE-RESISTING THROUGHOUT WITHOUT AFFECTING ITS UTILITY AS A BUILDING MATERIAL.

THE BRITISH NON-FLAMMABLE WOOD COMPANY, LTD., who have recently introduced into Europe the wood now being so largely used in America, have erected large works in this country, and are now taking orders for the supply of the NON-FLAMMABLE WOOD. The whole of the Carpentry and Joinery in the following notable buildings in New York, amongst others, consists NON-FLAMMABLE WOOD:—The COMMERCIAL CABLE BUILDING, The QUEEN'S INSURANCE BUILDING, and the R. G. DUNN BUILDING.



NON-FLAMMABLE WOOD has been tested by H.M. Admiralty, and large orders have been given by H.M. Government.

mmittee had selected contractors and invited tenders from em, and they had hoped to be able to submit the tenders they commended to the Council that day for formal acceptance. ney had, however, been unable to obtain the tenders in time that meeting, and they recommended the Council to give em authority to accept one of the tenders, and that a resolun be passed at that meeting that the seal of the Council be ixed to the contract. The work in connection with the rrying on of the asylum farm was proceeding satisfactorily der Mr. German's superintendence. The committee estimated at the sum of 260*l.* would be required during the ensuing ar for carrying on the farm, and they recommended the uncil to set aside that amount for such purpose.

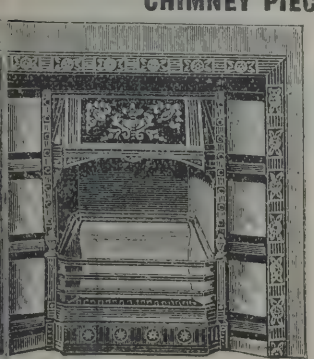
The report was adopted.

SOCIETY OF ENGINEERS.

a meeting of the Society of Engineers, held at the Royal ited Service Institution, Whitehall, on Monday evening, y 1, Mr. John C. Fell, president, in the chair, a paper was d on "Petroleum Motor Vehicles" by Mr. James D. Roots. e author first referred to the prejudicial effects upon road omotion which were brought about by early prohibitory islation, which was continued until 1896, when the Locotives on Highways Acts came into force. He then described approximate chronological order the various types of petrom road vehicles, commencing with the earliest known efforts solve the problem of road locomotion by vehicles in which propelling agent was the power produced by an explosion internal combustion engine. The Daimler, the Hardaker, Benz, the Butler, the Roots and Venables, the Bollee, the Dion and the Petter petroleum motor vehicles of various es and types were described and their comparative merits demerits pointed out. By showing the different stages of gress of some vehicles, the author indicated the lines along ch the development of the petroleum motor vehicle had proded. A comparison was made of the respective running ts of petroleum oil and petroleum spirit vehicles. The hor stated that, taking the average of several of the best wn petroleum spirit vehicles, the fuel cost per B.H.P. was nd to be about six times greater than that of the author's roleum oil vehicles. The paper was profusely illustrated, no er than fifty-four general and detail views of motor vehicles ng shown by the author.

ST. NINIAN'S, PERTH.

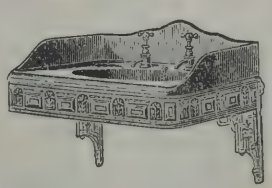
A MEETING of the Chapter of St. Ninian's Cathedral, Perth, was held, at which the tenders for the work in connection with the improvement and completion fund were considered. It was reported that the amount subscribed to the fund, including the Wordsworth Memorial Fund, was 8,629*l.* 10*s.* 8*d.* Mr. Pearson, the architect, who was present, made a statement as to the sum actually required for the various branches of the scheme, which showed that the amount subscribed would be quite inadequate for the work proposed. The Chapter resolved to adjourn until Friday, May 5, to give the members an opportunity of fully considering the tenders and plans. A meeting of the diocese of St. Andrews, Dunkeld and Dunblane was subsequently held, under the presidency of the Bishop.



A resolution was unanimously carried to the effect that the Chapter should be urged as soon as possible to use the money already obtained, and begin the improvement of the cathedral, and as other money came in to proceed with the remainder of the scheme. Special attention was directed by Mr. Baxter to the importance of having the very best work put into the cathedral, even although this might involve the undertaking of less work at one time. The Bishop addressed the conference, expressing his great thankfulness for what had already been done, and his hope that every effort would be made to give the poor of the diocese an opportunity of showing their interest in the work.

TWENTY-FIVE MILES OF GLAZING.

MR. SAM DEARDS, of Harlow, has just completed a huge glazing contract at Messrs Swan & Hunter's shipbuilding yards, at Wallsend, Newcastle-on-Tyne. This well-known firm of shipbuilders has been busy for some time past in erecting two lofty buildings, large and capacious enough to enable them to build the largest kinds of merchant vessels under cover, the dimensions of each of these fine structures being over 500 feet long by 75 feet wide, 80 feet high to the eaves, and 120 feet high to the apex of the roofs, and these two buildings have been entirely covered with glass of ¼ inch thickness, weighing with the patent steel bars over 300 tons, and comprising some 26,000 squares of glass, or, in other words, twenty-five miles of glass 1 foot wide.



What makes the work surprising is, that the patent glazing

not only stands the vibration of the buildings, occasioned by the violent storms of wind that sweep down the coaly Tyne, but also the expansion and contraction of these structures, which are all built of angle and tee iron Besides all this there are running daily four electric cranes inside the roof weighing some 15 tons each, and one very large crane on the outside of one of the glazed roofs, weighing over 20 tons. These cranes are continuously carrying heavy loads of iron, steel, &c., used in the construction of the vessels being built under the covered buildings, and yet owing to the special features of the system of glazing employed not one single square of all the 26,000 used has shown any kind of fracture or crack by its method of fixing. This alone "goes without saying" how well the system is adapted for buildings such as these, and should speak volumes in its praise and gain the attention of all architects and engineers

The chief features of the system are as follows:—A specially prepared bar in T steel is made, having a centre web with turned-up sides, so as to form a groove or gutter on either side to carry the squares of glass, and over the centre web is fixed a lead capping, which is held down by pins of copper every 9 or 10 inches, and these acting as springs give and take to every change of temperature and every need of expansion and contraction, which bolts, nuts and screws never do. Hence, to cover such an exposed building, subject to such severe and extraordinary strains and conditions as above stated should be the means of bringing this system well to the front and to the notice of all architects, builders and engineers For the continual fracture of glass, even upon sound and substantial buildings after once glazed, is always a serious item and one that has to be met by the contractor or owner, and if such work as this contract can be carried out on buildings of such a fragile and light construction, how easy it is to conceive that this system is equally as good on any substantial buildings and large roofs of railway stations, warehouses and other structures Besides this great advantage of non-fracture of glass after glazing, Mr. Sam Deards has so arranged and fixed the whole of the glazing on these buildings that all climbing about on the outside of roofs is entirely avoided, as every square of glass can be taken out and replaced all from the inside, so saving all expensive scaffolding and specially made ladders. This alone is a feature never before achieved by anyone, and considering the immense amount of time it saves and the great risk and dangers involved by outside repairs, this is certainly worthy of the highest commendation, and Mr Sam Deards is to be congratulated upon achieving so worthy a valuable an acquisition in the manner of glazing all such large a extensive lofty roofs. The concluding feature of this system while possessing all these exceptional and guaranteed adva tages, yet the cost is not expensive, but on a par with all oth systems, and in most cases much cheaper.

It should be mentioned beside the roofs of this buildi both the sides are glazed, and Mr. Deards has invented special section steel bar for this purpose.

There are several sections used in connection with t patent glazing, and the capping can be of lead, zinc or copp and samples and price, with full drawings of the system, whi for guaranteed work and cheapness cannot be equalled, can obtained of Mr. Sam Deards, of Victoria Works, Harlo Essex, or at his London office, 34 Old Broad Street, E.C.

THE WEEK.

ONTRACTORS would require to have the Exchequer at eir back if they have to meet all the claims which are ade on them under the Workmen's Compensation Act. ne of the strangest was heard in the Court of Appeal on urday. A man who was employed on the widening of Great Western Railway between Newport and Cardiff s killed by a train while crossing the line on his way to work. He found it more convenient to take that route n to proceed by the highway, and as he was known to the way officials, he was allowed to do acts which with ordinary n would be dealt with as trespassing. An action was en by the man's representatives against the contractors, l the County Court judge decided in their favour, on ground that the accident arose out of and in the course his employment. If a contractor is to be responsible accidents to men on their way to or from the works it uld be economical to bring them backwards and forwards pecial carriages with quiet horses and sober drivers. The tractors appealed, and on Saturday Lord Justice SMITH Lord Justice VAUGHAN WILLIAMS declared there was no onsibility, since the man was injured at a place which was under the control of the contractors. Lord Justice MER took an opposite view, because the permission to s the line would not be given if it were not known the was in the contractor's employment. There must be e reason for allowing men to use a railway as if it were gh road, but what advantage could arise to a contractor the arrangement? Men's hours are counted from the of their appearance at the place where they are to ur, and the contractor cannot take account of how they e, whether by short cuts or by means of conveyance. unately the majority of the Court took that view, and eforth a contractor will not be liable if a man should ible on leaving a public-house on his way to his em- ment. In the Sheriff's Court, Edinburgh, the question arisen whether three grandchildren can claim com- ation for their grandfather's death. He was killed in ber last while engaged on a building in that city. The ractors pleaded that plaintiffs had no claim. But the e decided that they were entitled to sue for com- ation, as they were dependent on the grandfather for ort. We may yet hear of claims for solatium by more nt or dubious relatives.

ICTORIAL advertisements in newspapers are common gh, but it may not be known how readily they can be ht under copyright law with all its pains in penalties. Irish Courts have been occupied with a case of the which has ended in a way that was not expected by of the parties concerned. Towards the end of 1896 ographer in Leeds brought out one of those coloured which are used for advertisements. The subject was miliar Santa Claus. The plate was produced in l sizes, and copies to serve as a large poster and as a bill were prepared for a Dublin firm in order to nce a Christmas sale. The manager of the firm sent to two of the Dublin papers with orders to make of them to be used with the firm's advertisement of le. A handbill bearing a name that was familiar in could not be supposed to be illegal, but the litho- er brought actions against the owners of the news- as well as the firm for infringement of copyright. laster of the Rolls, when the case came before him, sed the actions against the newspapers, but awarded s. as damages against the firm, which sum he said he ed as full and ample compensation, erring, if at all, e side of excess. The plaintiff appealed. There difference of opinion in the Court. Lord Justice BBON admitted that the Copyright Act applied es of "morally innocent infringements by inno- people," but he maintained that the thing pub- in the two newspapers could not be considered as a f a coloured lithograph. The plaintiff had accepted m the firm, and to obtain a far larger sum—for the defendants were supposed to be liable for 251,211 separate and distinct offences—he could not recognise as justice. Lord Justice WALKER and Lord Justice HOLMES, however, took an opposite view of the case, and came to the conclusion that the newspapers were liable. The order of the Master of the Rolls was therefore reversed. Pictorial advertisements in newspapers are becoming more common because they are attractive, and retain as well as arrest attention. Plates from *The Architect* have been often used for the purpose without obtaining the necessary authorisation. According to the decision in the Irish Court of Appeal the employment of a part of a design is a serious offence, and as a penalty can be claimed on every copy that was printed the penalty may amount to a large sum. The only safe course will be for publishers to obtain a guarantee of responsibility for copyright penalties from those who wish to combine pictorial subjects with announcements.

THE late Sir JOHN FOWLER was a shrewd engineer who preferred to follow the system of the STEPHENSONS and LOCKE rather than the brilliant but profitless triumphs of BRUNEL. The sale of his pictures at CHRISTIES' rooms on Saturday made it plain that his judgment was as keen in art as in railway works. In most cases the prices obtained were far in advance of those given for the works. A landscape of HOBBEMA sold for 9,100*l.*, or three times the amount paid by Sir JOHN FOWLER. TURNER'S "Venice," which was bought for 2,688*l.*, brought 8,200*l.*, and for the same artist's "Oxford" 4,000*l.* had to be paid, an increase of 2,780*l.* A drawing of "Lake Nemi" by TURNER was sold for 3,150*l.* It formerly belonged to Mr. WINDUS, whose name should be held in respect, for he was the first amateur who allowed his collection to be seen by all who cared to visit his house at Tottenham. In a few cases TURNER'S drawings did not realise the sum given for them. LANDSEER'S works also were found to have declined in value. His "Ptarmigan Hill," which cost 3,400*l.*, had to be sold for 2,100*l.* MEISSONIER is evidently still prized. His "Smoker," a picture measuring 6½ inches by 4½ inches, for which thirty years ago 399*l.* was paid, on Saturday rose to 1,344*l.*, or at the rate of 46*l.* per square inch. A small head by GREUZE was bought for 1,680*l.* Altogether Sir JOHN FOWLER'S ninety-one pictures realised 65,355*l.* 13*s.*, and was therefore the most valuable collection belonging to a modern engineer. Lord ARMSTRONG, who possesses more costly works, is a manufacturer rather than an engineer.

THE late SAMUEL PALMER was esteemed as one of the most delightful water-colour artists of his time. He was a pupil of JOHN VARLEY, a friend of WILLIAM BLAKE and a competitor of GEORGE BARRET. But with all his love of nature and of MILTON, he was an enthusiast for architecture. A letter which he wrote twenty years ago on the proposed decoration of St. Paul's has appeared this week. He agreed with Sir GILBERT SCOTT, who said, "Let it alone." PALMER'S reason for opposing decoration was explained as follows:—"Sir CHRISTOPHER having kept the deeply-set windows of that sloping wall between the dome and the whispering gallery narrow, so nicely dispensing the 'dim religious light' as to leave the cupola in a sort of poetic mystery, mosaics were proposed not long ago to make the dome more cheerful, and metallic reflectors to brighten the mosaics. The slope of the pilasters is continued upwards at present by the architectural divisions in the chiaroscuro of Sir JAMES THORNHILL, so that the eye does not detect the artificial perspective; but directly the chiaroscuro is removed and horizontal layers of any kind substituted the secret will out, the dome will seem to be 50 feet lower, and the wall which supports it about to topple upon the spectator. WREN insisted on such nicety of proportion, even on that vast scale, that I believe he refused Father SMITH an additional 7 inches in the width of the organ case." SAMUEL PALMER was a fine colourist and was well practised in contrasts. It was not, therefore, through indifference to what can be gained by the introduction of colour in buildings that he opposed the projects which were then advocated. He believed as much caution should be exercised in mural decoration as in divinity, and the "peril of an illiterate and slapdash theology" was in his eyes comparable to rash experiments on the walls and cupola of St. Paul's.

ARCHITECTURE AT THE ROYAL ACADEMY.—III.

FROM time to time several architects have added to Freemasons' Hall. The latest is Mr. H. L. FLORENCE, who has designed a "New Library and Museum." The room is not shown on a drawing that is satisfactory, but it offers another example of the use of the dome, which, with marble columns, is the principal feature. The books are in cases which are placed apart. The dome again appears, and on a large scale, in Mr. J. W. SIMPSON'S "Union Church, Queen Square, Brighton." This is a remarkable building, well lighted, but adapted mainly to accommodate listeners. It is a preaching house rather than a church on the ordinary plan. The site was not easily adapted, but interior and exterior views suggest that success has been attained. In the terrace of five houses represented in "Cannon Street Improvement, Dover," by Mr. IVOR S. PRICE, we see a departure from the ordinary custom of having all alike. Generally there is resemblance, but it will be found that three types were adopted; the architect's labour was increased, but the result is more satisfactory. Mr. BRIGGS'S "Design for Screen, Jesus Chapel," is closed in for a great part of the height. Above is a rood. Mr. H. L. GODDARD has a half-timber Bank at Bedworth. Mr. S. W. CRANFIELD'S "Trefiw, Ridgeway, Enfield," is a house in which a great deal of contrast is introduced. The "Police Station to be erected at New Scotland Yard," by Mr. C. A. BATTIE, is a building which appears intended to suggest that Queen Anne has also stern qualities. In the "Church in Essex," by Mr. C. E. POWER, timber appears to be largely used, but drawings at so great an elevation are useless for exhibition purposes. Another collection of domestic buildings is next met with, to which the contributors are Messrs. W. A. AICKMAN, R. W. K. GODDARD, H. I. TRIGGS, VALLANCE & WESTWOOD, C. J. HAROLD COOPER, T. E. HARDY, F. FORBES GLENNIE, H. O. CRESSWELL, E. G. DAWBER & WHITWELL, R. O'B. NORTH and C. E. MALLOWS & GROCOCK. Mr. H. T. HARE shows the "New Town Hall, Henley-on-Thames," where the people must be exceptionally loyal if the size of the royal arms over the entrance can be taken as a test. Mr. W. S. BATES has a "Design for a small Timber Church," in which even the buttresses are of wood, but it is more suggestive of an ordinary stone church in form. The "New Spire, Saltburn Church," by Messrs. CLARK & MOSCROP, gives completeness to the building, and all might be the work of the same hand. "St. Luke's New Parish Church, Maidstone," by Mr. W. H. SETH SMITH, is an indication of the transition from Gothic to Italian which appears to be in progress. There is no "dim religious light," and the building has a spacious appearance which alone would commend it. In the "Passmore Edwards Public Library, Acton," Mr. M. B. ADAMS gives another example of his success in treating buildings where height is not allowed, and which, in spite of drawbacks, are made to have a sort of individuality. Economy had to be considered, but there is greater variety apparent than is seen in more costly buildings. Another building in which there is no piling of storeys is the Board School, Gloucester, by Mr. G. NICHOLAS, and although the area occupied is large, there is an advantage for the children. The "Proposed Street of Flats in Dulwich" is a cottage row. The houses are mainly red brick, but one is white, and the great sweep of a roof of one pair gives novelty to the arrangement. Mr. UNSWORTH sends a many-gabled house at Pyford, and Mr. MARRIOTT one at Limpsfield, which combines white and pale red to a degree which it will be difficult to realise. The design for the "Royal Institution, Liverpool," is not Classic enough to correspond with the local standard of taste, but elsewhere such a building as Mr. NORTH shows would find admirers.

The "New City Hall, Belfast," will be looked on with regret and surprise by many architects. It is of the type of the Leeds Town Hall, which long since was voted to be obsolete. Designers who feel obliged to put some kind of invention into almost every line of a Classic building, or at least to "break up" lines to an extent for which Greeks and Romans afford no authority, will gaze with a saddened surprise at the simplicity of the building. The elements of it are few. But we suppose the shrewd citizens of the Ulster capital realised that when there are repetitions machinery can be utilised and a show produ at a moderate cost. Nor is there any denying the rep of the City Hall, and that is a quality which is gratify although it is not one which is expressive of our time. BRAMWELL THOMAS'S building will hereafter be compa with GANDON'S Dublin Custom House, and that sho be sufficient evidence of value. Compared with so and quiet a building the houses by Mr. L. F. CRA Messrs. BATEMAN, Mr. TRIGGS and Messrs. HALL, COO & DAVIS appear like minnows near a triton. Mr. R. PAUL shows a chancel for Chard Church; Messrs. PIT BALFOUR have a design on a small scale for the Ca Law Courts, which is skied; Mr. H. H. GORDON a h in Essex Street, and Mr. ATKIN BERRY a "House at Kenl Mr. BAILLIE SCOTT'S "Drawing-room, Chaplain's Ho St. Mary's Home, Wantage," is novel, a combinatio the simple and the costly, of severity and distinction in furniture which deserves attention. The designer principles which he logically obeys, but they are not t accepted by fashion.

The eastern wall of the Architectural Room is ma occupied with houses large and small and other habitati The Hon. A. MCGAREL-HOGG contributes a quiet f house. But for quietness it would be hard to match "Stables, Brahan, Perth," by Messrs. F. W. BEDFOR KITSON. There is a blank wall to be seen, broke one small window and an occasional buttress, for the p of view is taken from outside; but the drawing is so coloured it might appear in a water colour exhibition a illustration from one of Mr. HARDY'S novels. Mr. PA WATSON'S "Lea Park, Godalming," is in its way a cha teristic English residence, partly half-timbered. There large conservatory, and the interest is enhanced by introduction of a fountain. Mr. MILEHAM'S "New H at Southwold" owes much of its attractiveness—at leas paper—to the bright green persiennes. There is no re why such screens should not be more largely used; utility may be more often tested in France, but from appearance they could be as helpful here as they abroad. The "Birmingham and District Counties E Edgbaston," by Messrs. BATEMAN & BATEMAN, occu a corner site; the lower part is of masonry, and is an excellent entrance. Among the drawings ma mentioned "St. Mary's Recreation Rooms, Putney, "Design for Free Library," by Mr. S. PERKS; "Cripp Home," by Mr. T. PHILLIPS FIGGIS; "Roadside Hou by Mr. H. F. T. COOPER; "House showing pro Garden," by Mr. A. F. VIGERS; "Flats at Kensi Square," by Mr. G. D. MARTIN; "Whitechapel Pi Gallery," by Mr. C. H. TOWNSEND; "House at Wimble by Mr. G. A. LANSDOWN; "Garden House," by M J. FERGUSON; "Le Nid" and "Village Hall, Onchar Mr. M. H. BAILLIE SCOTT; "Design for Port Eliz Public Library," by Mr. H. T. BUCKLAND; "Hous Gas Company, Scarborough," by Messrs. HALL, COOP DAVIS; and examples by Messrs. W. T. WALKER, FO & MAULE, F. D. CLAPHAM, H. O. CRESSWELL, ALLFREY, C. F. A. VOYSEY, L. F. CRANE, G. F. C SON, T. E. PRYCE, F. W. BEDFORD, PARKER & U R. W. SAMPSON, W. E. DOBSON, F. E. RAVENS R. BLOMFIELD, W. F. HARKER, B. PITE, J. BE PIETER RODECK, J. E. LOFTHOUSE. The few visi the Architectural Room are supposed to take much i in houses, and it must be allowed that this year in the s drawings they are provided with a variety of examp town or country. There is one lady architect, Mrs. C whose "Proposed House near Dolgelly, North Wa combination of green and purple, will no doubt c some attention. Domestic architecture has triumph the Council, and it is reasonable to expect it will neglected by those visitors who have the courage t the room.

"The New Radcliffe Library, Oxford," might ha first sketched as a Gothic building by Mr. T. G. JA and then was transformed into Italian; the new f buttress is a remarkable example of evolution. effect of the new Westminster Cathedral is likely t adoption of a more or less free Byzantine style for Catholic churches. Acton is one of the poorest s to be found near London, and to be sent to that mi supposed to be a sentence of death by starvatio

Interior of Church of Our Lady of Lourdes, Acton," by Mr. E. Goldie, appears however to be a costly building, with a cross in front of the apse which recalls the famous metal-work in St. Mark's, Venice. It is an interesting design, which some generous person may be disposed to realise. But why the style should be revived at the present time is not easily understood. The "Loftus-in-Cleveland Church," after alterations by Messrs. Clark & Moscrop, has a satisfactory appearance. Mr. H. D. Bryan introduces a rather novel tower in his design for St. Martin's, Knowle. The competitive design for Dorking Infirmary, by Mr. S. W. Neighbour, is indicative of a severe but peerless building. In the Peter Memorial Church, Pirling, Mr. Stevenson has a tower with a coronal.

The Prudential Assurance Company has expended an amount of money on the erection of offices which must amaze many of its older rivals. But confidence can be as well inspired by red brick and terra-cotta as by other means. The enlargement of the head offices in Holborn is a daring undertaking, and a vast increase of business must be anticipated to make a building necessary which in size will surpass all similar offices in this country. Mr. Waterhouse does not propose to repeat the existing offices, though the style is adapted for continuation. There will be sufficient difference to suggest where the new work has commenced, and in the centre will be a massive tower with large gateway entering on a court. The offices will be an important addition to the street architecture of London, and fortunately in that part of Holborn there is more than average width of roadway, which will enable the work to be properly judged. Mr. E. W. Mountford shows a perimetrical elevation of the Liverpool Museum and Technical School. Mr. H. B. Garling in 1857 won the first premium for the War Office, and his design is now in the Academy. At the same time Messrs. Coe & Hofland, Banks & Barry and Mr. Gilbert Scott obtained premiums for the War Office, while M. Crepinet, a French architect, obtained the prize for a block plan, which the committee declared was very able and magnificent. It is needless to say the project of new offices was not further carried out; but as the subject is revived, it is interesting to see one of the designs which was victorious forty years ago.

It is evident Mr. Garling was respectful to Barry's vestage of the Treasury offices, and was desirous to produce a building that would well range with so admired a work. The "Head Offices, Metropolitan Asylums Board," by Mr. E. T. Hall, will be an ornament to the Victoria Embankment. It is Italian rather than Flemish in treatment, and we hope there will be no obstacle to the introduction of the sculpture proposed, without which the design would lose much of its interest. The aid which sculpture can afford is also seen in the "View of Main Staircase, the Guildhall, Cambridge," by Mr. Belcher, where a large scale and separate figures are introduced with success. There is not much to be made out of a "Lime, Brick and Cement Wharf," unless it is not to be managed on commercial principles; the most that can be said of Mr. Ayrton's design is that he has not attempted to be ambitious at the cost of his client. Mr. E. P. Warren shows two works in Oxford—a drinking-fountain of a pleasing character and a hotel which is not ultra-modern. Mr. A. O. Bryan's "Pupil Teachers' Centre, Bristol School Board," becomes heavy in character from the rustication. We have also to mention the "School Board Offices, Newcastle-on-Tyne," by Messrs. Armstrong & Knowles.

When it is remembered there are nearly three hundred drawings in the Architectural Room, we cannot expect they will all be remarkable examples. But in proportion to the number shown it must be admitted there are fewer works of the usual of designs which reveal incapacity. In design and draughtsmanship there are very many of the drawings which will sustain scrutiny. It is a pity that so much time and expense will be without any advantage to the exhibitors, but in that way English architects are not in a worse position than French architects, whose drawings are not only neglected by the public but are considered to be failures by painters and sculptors.

The Conversazione of the Society of Arts will take place on June 20 at the Natural History Museum, Cromwell Road.

SCULPTURE AT THE ROYAL ACADEMY.

THE question is often asked, What becomes of works of sculpture which were seen in any Academy exhibition some years before? From the quantity of pictures which appear every season in the auction-rooms, it is easy to assume that within a limited period the majority of examples of the painters are doomed to pass from the possession of the original owners. A little exercise is therefore afforded to the speculative powers of amateurs in guessing whether there is to be a rise or fall in the appreciation of them as expressed in coin of the realm. But with sculpture it is different. The most constant attendant at Christie's would be puzzled to say what price would be attained by one of Baily's smooth nymphs or Lough's demigods. Can Behne's busts have a market value, or would anyone be able to recognise Stephens's *Comus* if it appeared in an auction-room? In England works of art are not purchased merely for the pleasure which they afford through the eyes. Much of their interest is derived from the conviction that they are investments which one day will bring reward to the owners. But as sculpture has so uncertain a future it cannot be prized like painting as an article of commerce, and as a consequence there is little patronage of the sculptor's art.

It is therefore a satisfaction not only for sculptors, but for those who are aware of the risks which attend devotion to that form of art, when they see it announced that a figure or group has a definite destination. Portrait busts and statues, it is presumed, are to be claimed when an exhibition closes, but that class of work is sometimes produced as a speculation. It is well to be assured that Mr. Lynn Jenkins's group *St. George* is destined for a church in South Devon; that Mr. Alfred Drury's base and column for electrical light is a part of the sculpture with which Alderman Harding will adorn City Square, Leeds; that Mr. Brock's statue, *Sir W. T. Lewis*, is to be set up in Merthyr Tydvil; that Mr. Thornycroft's burly *Oliver Cromwell* is to find a place near the Westminster Town Hall, and his *John Colet*, a dean who used to have little boys flogged to afford diversion to himself and his friends, will be placed in front of St. Paul's School, Hammersmith. The intimation of a destined purpose adds to the interest with which those works are regarded.

The influence of patronage is, moreover, transforming the character and size of the sculpture which is to be seen at the Academy. The Foleys, Macdowells, Theeds, Marshalls, Westmacotts and their successors dared not attempt anything under life-size, and their work was always costly. Now we have many statuettes, medallions, caskets, cups and works of a class which formerly would not be admitted within the Academy. But a small figure has more chance of finding competitors for its possession in a sale room than one which is ponderous, and the sum received for it will bear a larger ratio to the original cost in one case than in the other. Moreover, with small works there is less necessity to adhere to stereotyped rules, and consequently originality need not mean ruin.

From the variety of its contents the Lecture-room of the Academy is sure to receive more attention than the Central Hall, where the larger examples of sculpture are displayed, with Oliver Cromwell as the dominant power. This year it is the most interesting of all the rooms. The most striking work is Mr. Derwent Wood's *Dante at Ravenna*. The poet, who is seated, is supposed to have seen the inseparable figures of Polo and Francesca, whose bodies project beyond the main lines of the work. A painter could easily have suggested Dante's vision, but a sculptor is handicapped in attempting so difficult an enterprise. The poet was the friend of the girl's father, and, as Carlyle remarks, she may have sat on Dante's knee, a bright innocent little child. It is, therefore, the exile in Ravenna who is seen to whom the place recalls the tragedy, and not the companion of Virgil. His face reveals his agony. The subject is original, and the sculptor has expressed his thought with a stern realism that is in keeping with the "Divine Comedy." Another work in which the usual limitations are disregarded is the ivory and bronze group by the late Harry Bates. We believe it was to be suggestive of a monument, and the figures represent Time or Death, and a soul just passed out

of this world. The difference of materials helps to express the two spirits, and the base of the group symbolises London by means of St. Paul's, Westminster Abbey and other buildings. But their scale is necessarily small, and as a result the two figures assume more than gigantic forms. The group thus becomes a puzzle in spite of its beauty. Sculpture should be expressive without the aid of inscriptions, but neither of the works we have described has that quality. In the new proof he gives of his versatility, Mr. Herkomer is careful to prevent any doubt about his meaning, for he employs lettering to describe the groups in his *Triumph of the Hour*. It is a shield, but not in a military sense, on which pictures in enamel are executed. It is, we imagine, the largest example of enamelling produced in England. There are so many difficulties in the process, it is not always an artist can realise his intentions, and with a series of pictures the difficulties are increased. In this case there is sufficient uniformity in execution to prove it is the work of one artist. The "triumphs" are mostly simple contrasts. An emperor is slain by a lunatic, the sphinx is confounded by a peasant, Lazarus prevails over Dives, and so on. As we have said, the pictures have descriptive titles which are marked in the gilded ground surrounding the enamels. They should be their own interpreters, and indeed lettering is an expedient most often adopted by amateurs. Mr. Herkomer's shield is, with all the drawbacks, one of the few works of the year which are made subjects of conversation.

Mr. A. Gilbert evidently believes in the connection between groves and Gothic. His *Model for Bronze Screen at Whippingham* at a distance would be taken for a part of a Mediæval cloister, but the arches are not filled with Perpendicular or Decorated tracery; plant forms are employed instead, and being of gilded bronze the effect would compel the most rigorous Goth to approve of the innovation. Among the statuettes, Mr. Frampton's *St. George* is one of the most interesting. Mr. Sargent, the painter, attempts sculpture with a *Design for part of a Mural Decoration*. There is a representation of the Crucifixion, with a man and woman holding chalices that recall the winged ministering angels often introduced in works of a similar class. Mr. Derwent Wood's *La Paimpolaise*, a bust of a woman in hard wood with a wrought-tin headdress, is carved with marvellous precision. The *Electric Lamp*, by Miss E. M. Moon, is a figure of a mermaid having none of the stiffness or solemnity which commonly characterises a sculptor's efforts to apply his art to industrial purposes.

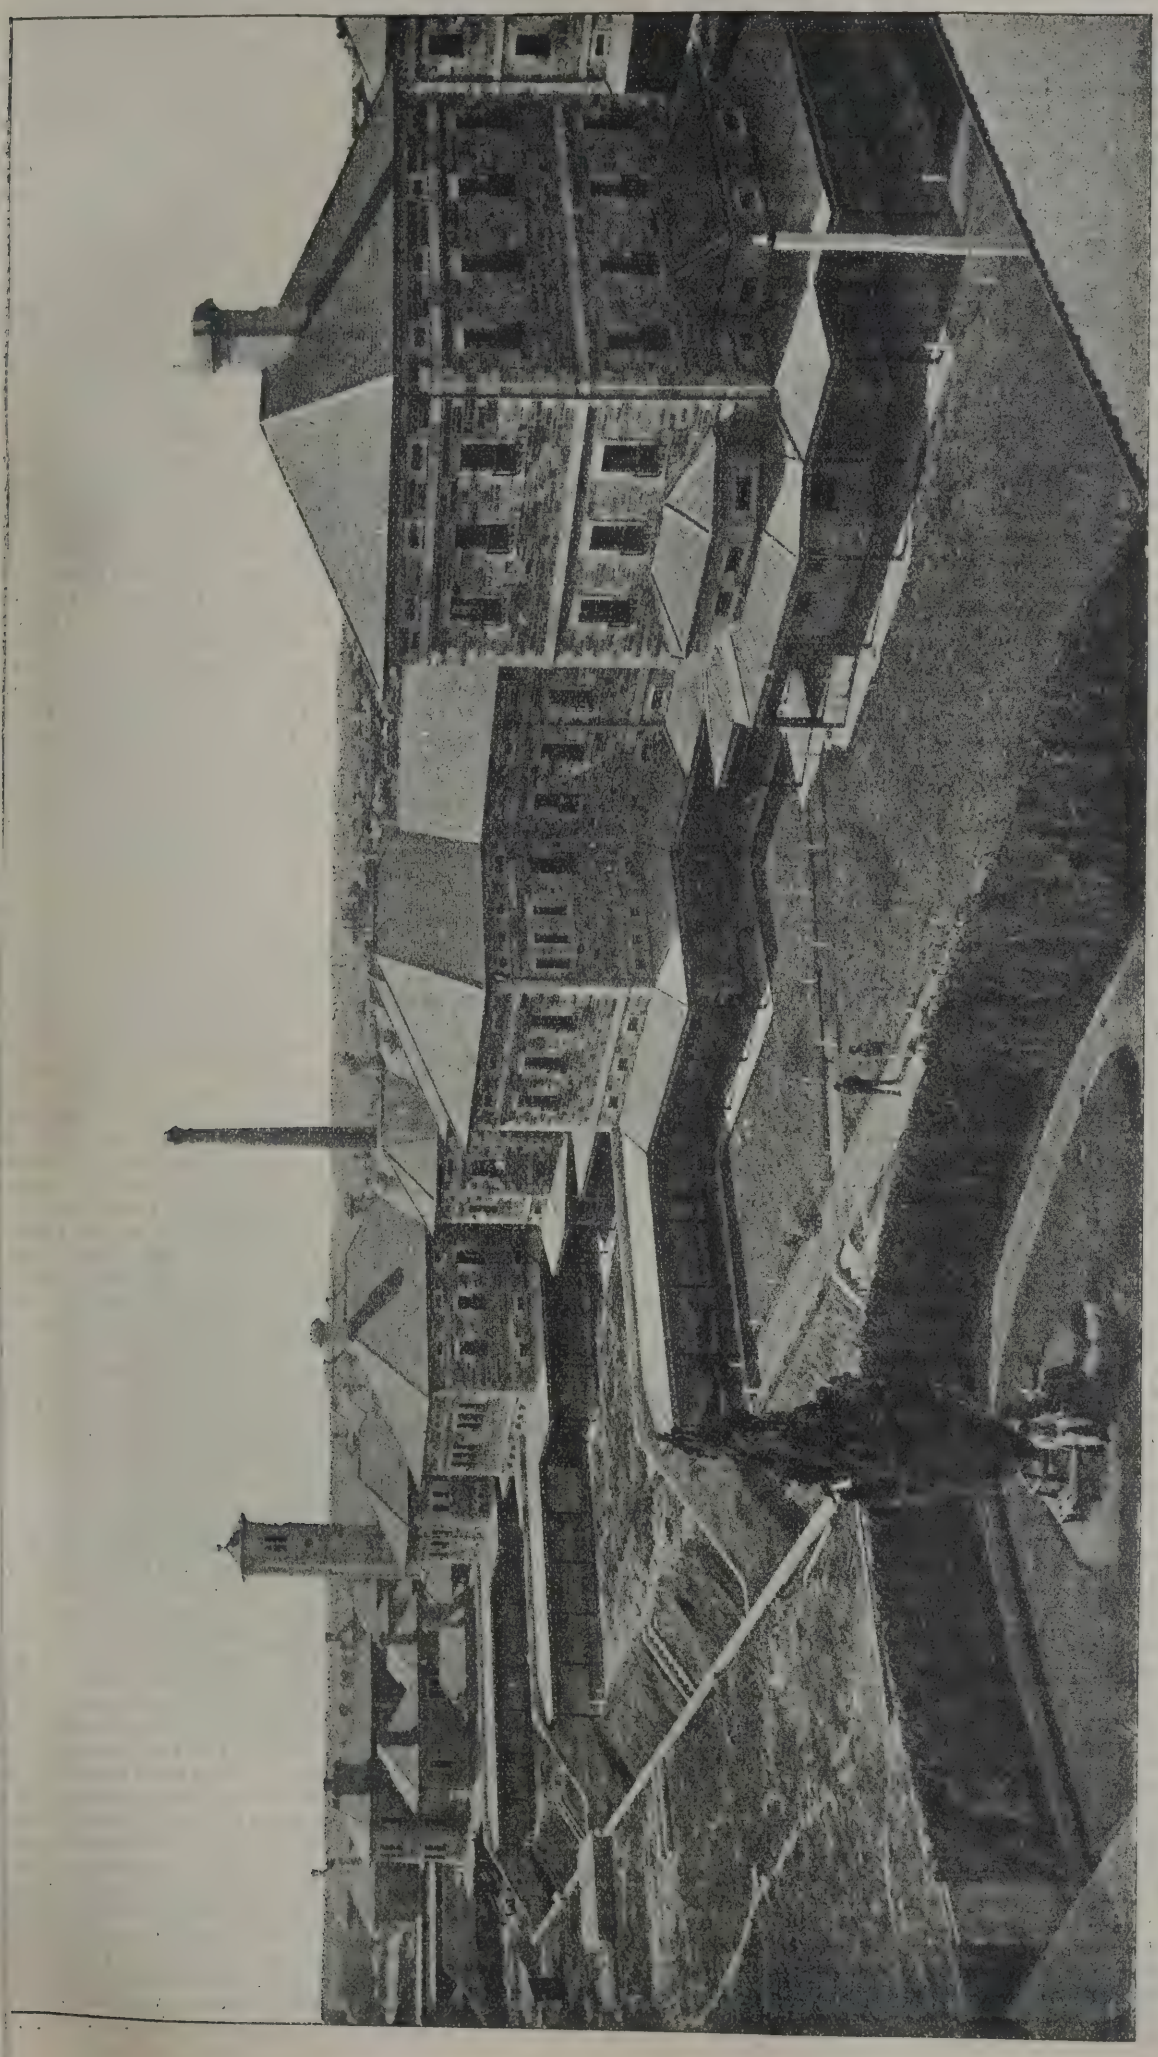
The marble statue, by Mr. Roscoe Mullins, having for title *My Punishment is Greater than I can Bear*, is a triumph over self-imposed difficulties. The figure is seated, one hand resting on the ground, the other is on his knee, and the head rests against the arm. That the subject is suffering mental pain is evident from the pose. It is seldom we see so much tragedy expressed by a single figure, or so remarkable a feat in carving. Among the numerous busts, Mr. Onslow Ford's *H.M. the Queen* will of course receive most attention. It will have historical value, for it represents Her Majesty as she appears. The sculptor has shown he was worthy of the commission by the care which is manifest in all parts of the work. Opinions will differ about the propriety of the introduction of a hand and arm supporting the chin in Mr. Goscombe John's *Sir Lewis Morris*. The bust becomes a fragment of a statue. It will be said painters adopt the expedient, and M. Bonnat's portrait of Leon Cogniet in the Luxembourg Gallery is a famous example of how much can be gained in that way. It is well, however, to remember what Reynolds says:—"Sculpture is formal, regular and austere; whatever partakes of fancy or caprice, or goes under the denomination of picturesque, is incompatible with that sobriety and gravity which is peculiarly the characteristic of this art." The poet would have looked as inspired if the bust had been treated in the ancient manner. Mr. Armstead's medallion, *The late George Price Boyce, R.W.S.*, is a record of the refined features of a remarkable artist who was too modest to secure the applause he merited. Mr. Birnie Rhind's *Science*, which is intended for the art galleries in Glasgow, shows that the sculptor did not allow himself to be restricted by the modest price he is to receive for his work. Another excellent northern work is the sketch of the statue of James V. for the Edinburgh Portrait Gallery, which is by the same sculptor. There are many other busts and portraits in various forms which the visitor will do well to consider, and it must be allowed that this year's sculpture affords encouragement for those who take a hopeful view of the prospects of the arts in this country.

AUSTRALIAN ARCHITECTURAL NOTES.

[From a Sydney Correspondent.]

(*Concluded from page* 291.)

At the Parramatta Asylum for the Insane a successful attempt has been made to relieve the monotony of large expanses of bare walls, pierced at regular intervals with rectangular windows. Of course, it was impossible to avoid a certain amount of sameness, but, as shown in the accompanying illustration, the general effect is good; moreover, the arrangement admits of a better classification of patients. The verandahs are indispensable, but, for obvious reasons, are of the plainest character. The severe simplicity of the building is relieved by the extensive grass plots, shrubberies, and gardens, which are kept in admirable order.



In other directions Australian architecture is making good progress, and it is noticeable that property owners are beginning to discover that there are less remunerative investments than handsomely designed business and other structures, with satisfactory interior arrangements, a circumstance which explains the activity of the Australian building trades at the present moment.

THE DECORATION OF ST. PAUL'S.

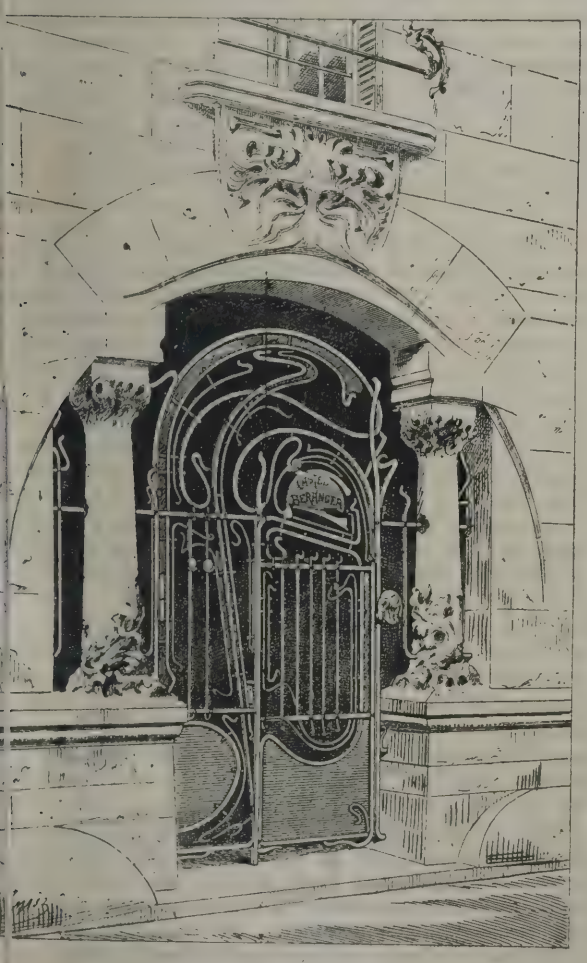
A lengthy letter from Sir William B. Richmond, R.A., appeared in the *Times* of Saturday last. The following extracts from it relate to his treatment of the cathedral; the remainder cannot be considered as treating of a technical subject:—

The amateurs, anonymous artists and literary adventurers who have rushed into print call for no answer to their effusions; they have answered themselves by the exposure of various emotions and diatribe. As far as the literature (which must have been almost as instructive and entertaining to the general public as the ritual question, with which it perhaps bears an indirect affinity) has a defined direction, it has expressed indignation chiefly that I should have had the temerity to make use of colour upon the mouldings and flat spaces of stone other than those spaces which it is vaguely stated Wren intended to adorn with mosaic. But I am also blamed for cutting back the stone. Now Wren could not have placed his cement and cubes anywhere on the walls without cutting back the stone, because thereby levels would have been relatively changed, therefore the cutting back of the stone for the purpose of laying the mosaic is not a crime but a necessity to preserve the proportions designed by Wren; all the levels are exactly where Wren left them. That argument against me is easily disposed of. The charge against me, which I intend to meet, is the colouring of the mouldings and stone and the bright colour that I have employed.

Broadly speaking, stone has always received colour upon the walls of interiors in the form of marble or pigment; generally it was also prepared by a thin and protecting cement or "stucco" as a ground for the pigments, from the days of the Memphic dynasties in Egypt down to some 200 years ago, when architecture for the first time attempted to stumble along alone, divorced by circumstances from her supporting sister painting, and in a degree also sculpture, much to her injury and theirs. Even in the interiors of houses in England oriental rugs designed for carpets were in the time of Henry VIII. fastened upon walls, no doubt to hide the prison-like character given to the interior of an apartment by a bare wall of stone. Bare stone is not a congenial material for the inside walls of any building, however desirable it is for prisons or fortresses. Why do we cover our brick or stone walls with plaster, hangings, paper or coloured pattern of any kind? Surely because left bare they have a comfortless unfinished appearance which upon the inside of a building is not felt. And if this applies to the interiors of rooms, palaces, even public buildings, why not to churches? It is only a prejudice which stands in the way, and a very remote one too. It is desirable that a prison or a fortress should appear forbidding or grim, but should either of those engaging sensations be aroused in a church, which should suggest hope, encourage every healthy desire and as far as possible satisfy a

ASYLUM FOR THE INSANE (REAR VIEW), GLADESVILLE, PARRAMATTA RIVER, SYDNEY.

craving for every form of beauty which art has the power to bestow? I do not say that a Quakers' meeting-house or a Presbyterian conventicle would be the proper places for splendour—it would be incongruous there; but as an offshoot from the great Catholic church, which has inherited many of the customs and ceremonials of that church from pagan and Jewish ritual, in the metropolitan cathedral, the centre of English worship, splendour of colour, as well as justly-balanced proportion, is surely appropriate. Such a cathedral, however Protestant, should not strike cold to the soul as if it were but a well-proportioned and dignified alley leading to the shades. It should arouse emotions which tend to possess the imagination with joy, not gloom; colour, not greyness. It should be full of pictures, bright and encouraging; there is grey and gloom enough in London and its people without accentuating them in St. Paul's. Architecture without colour is like the skeleton and muscles without the flush of beautiful colour given by the skin, the scarlet lips, blue eyes and golden hair of a beautiful woman. We want something more than anatomy, construction and proportion; we want life, colour, sparkle, all the attributes of a warm, generous existence and nature. In England the Puritans and iconoclasts, with their cold yet hell-fire worship of the shades that lead there rather than the rosy if thorny avenues which lead elsewhere, revolted against colour and ornament, indeed, against beauty of all kinds, calling them vain imaginings and Satan's most powerful weapons. This depressing spirit still presides over a considerable portion of the English character, which inclines to associate sterility with nobility, and gloom with "a reasonable hope." Belonging to that spirit is St. Paul's Cathedral, severe, prison-like, accurate, a magnificent skeleton which cries out for life and colour in the centre of a gloomy and smoke-begrimed imitation of ashen-coloured Hades. What a contrast such a spirit bears to that inspiring one which the Jewish, Egyptian, Assyrian, Persian, Greek, Roman, Byzantine, Moorish, Norman, French and English once were dominated by—the love of form, colour, metals and jewels, which impelled them to cover every nook and corner of their places of worship with the most costly material and every art and artifice of man's intelligent craftsmanship, generous and exultant, radiant with joy and hope, emblems of an ideal world. For the Temple of the Jews, the Parthenon of Athens, were adorned with every conceivable material and colour. The Parthenon, though built of marble, was columned in its interior, and exterior also, in a minor degree, mouldings, sculpture, walls, caps, drums and bases, and though built of marble it received in many parts of it a thin coat of stucco polished with wax, whereon gold and colour were applied. The Temple of Apollo Epicurus at Bassæ, built of porous stone, was likewise so treated within and without; indeed, so were all the Doric, Ionic and Corinthian temples. The most delicate carvings of the Moors, as well as the plain-stone surfaces of Arabs, Byzantines and the Normans (far more delicate and sensitive than any of the carvings or mouldings in St. Paul's are) were gilt and coloured with positive tones of pale blue, red or green, as I know by careful examination of many of the mosques and churches built by those cunning and beauty-loving peoples.



A few days ago, while searching among fragments of sculpture in one of the ground-floor galleries of the Louvre, I found an Ionic cap and base of the best period, and carved in stone, whereon large portions of a pearl white stucco no thicker than this paper were still adhering. The stone temples at Girgenti were so treated, and still retain traces of stucco. At Selinus, where the temples are of marble, there remain large portions of colour, mostly blue, white and a warm black, relieved by thin lines of red, and in the various museums of Syracuse and Palermo, besides others in Italy and elsewhere, are shown almost innumerable examples of the polychromatic treatment of architecture which would turn my Lord Wemyss's hair grey with horror if he beheld them. The Tomb of Ti at Memphis, though its ornamentation is carved in limestone with the most delicate refinement, is strongly yet delightfully coloured. We know that both the stone and brick interiors of Roman buildings were covered with variously-coloured stucchi imposed upon generally a deep and splendid red, and we know with what alacrity Raphael and Pinturicchio borrowed from the coloured wall decoration and gesso ornament discovered in the Baths of Titus, and employed the like in the loggia and stanze of the Vatican and in the Camera Borgia, also in that palace. We know how Giulio Romano used gold and colour upon the mouldings, caps, ribs and elsewhere of the now much-abused Palazzo del Te at Mantua, a building fine in its way and decorated, if with not the most perfect taste in every instance, still magnificently. All the stonework and most of the woodwork of our English cathedrals received a thin coat of "gessoduro," whereon colour and gold were applied. Bases, shafts, caps, cornices, ribs, flat and curved stone surfaces were figured with pattern gold or pictures, elaborate and delightful we know, as remains happily give us testimony.

How would the purist have liked the Treasure House of Atreus, that superbly proportioned dome, naked now, revealing its structure of stone masonry, the most perfectly jointed that have ever seen, when it was lined with copper and bron enlivened with embossed nail heads daintily chased? wonder! Or Nero's house of gold and ivory, or Xerxes's pala at Persepolis, not a bit Puritan or Quakerish or morbid, warrant, nor reminding of "The Shades," but lively, invigor ing and healthily hopeful. In periods when art was unison with all its faculties and used them in the vario countries that I have previously named (I omitt Spain inadvertently), all of which periods may be term classical, colour on architecture was not an adjunct—it w integral. Monochrome interior walls are a modern innovatic not an ancient tradition of taste, partly, as we have seen, innovation created by a variety of regrettable conditio brought about by the modern forces of Puritanism, division labour and individualism. The later Renaissance builde (and Wren came quite at the tail of them) were so absorbed the study of the revival of late Classical ornament, and th busied themselves with its revival, but forgot, or did not kn probably, that colour had played a very important part architecture even in the very periods which they we attempting to resuscitate, and it is partly due to that difference or ignorance of polychroming that painting genera became divorced from architecture except in the case framed pictures in churches, which became the fashion in t seventeenth and eighteenth centuries, but that fashion nev took root in England; hence the fallacy soon became curre that to be "pure" and "classical" architecture must abju colour. This belongs to the same misconception of the artis function which led Poussin, the poetical French classicist, fear the charms of Venice lest they might allure him away fro form and design. But, in truth, this innovation of idea which would place form upon a kind of throne virtue is not classical in the very least; it is not mo than 200 years old, and what is that compared to t 4,000 years of another tradition? The later Renaissan churches are artificial imitations of late Roman design. Th have very little of the classical spirit in them at all; it is gloomy reforming cloud which they anticipated and which w sympathetic to the end of the seventeenth century and so till forty years ago, when a revival in a more healthy directi was started. As it were, the skeleton of architecture survive and even her muscles survived something like death, for t obdurate laws of construction bind her with bands but slight flexible. But the real life of it, that generous completene which made architecture up to 200 years ago so human ar sympathetic, went when her two sisters gave her but slend support, and ceased to claim close and almost indissolub relationship. The very fact that Sir Christopher Wren had in his mind to decorate St Paul's with mosaics proved him be a man far in advance of his time in England, and I suspe that the only reasons which went towards their non-achiev ment were due to lack of money and weariness and conseque apathy on his part induced by the abominable treatment had received. If Sir Christopher had carried to an iss what was at some time his intention to do, he would ha very swiftly discovered, as I did (and hence most of the ce sure), that the decoration in colour of the panels alo must be far from satisfactory, but there can be but litt doubt that Wren's mosaics would have been *deep*, not *fair*, colour tone; fair colour was not in fashion in his time, and h a much cleverer man than many of his advocates make hi out to have been, would have recognised the almost insupe able difficulty of bringing his coloured spaces into harmo with their stone surroundings without the aid of an echo colour, and a strong one, too, upon the stone mouldings a plane surfaces. For it should not be forgotten that the sto of which the cathedral is built, when clean, is very white, a colour is apt to appear dark in contrast with it. Finally, the two reasons which I have suggested as probable, St. Pau was not decorated, but painted with oil colour from top bottom; better that perhaps than the mealy-coloured sto which is so rapturously admired by some whom one suspe of being colour blind—a not uncommon inconvenience perienced by Londoners, I am informed. Surely it is well to forget that Wren's foreign experiences were limited Paris; he never saw any completed building fully furnish and coloured; much of the glass in our English cathedrals h been destroyed before his time; the wall-paintings, hack off or covered with whitewash, had been submitted to barbarous followers of John Knox and mobs of Puritan savag It is only in the last thirty years that any knowledge of " art"—by that I mean the union of the triad—has become possible property of even a few; and it is surprising how lite architects, sculptors and painters assist by practice, though theory they may accept it, a union which is before long qu inevitable. The reunion of the arts is as certain as the victo of good over evil is; pedants may desire to delay it, orat may rant about classical purity, Nonconformist temperame may regard colour as devilish, sensual or what not, and pru may still love the nudity of architecture and reluctantly per

to wear a fig-leaf or two; but the very fact of the almost erical wail that has gone forth (not at all representing public ion in the press, but only a minute section of it) shows that purist trembles upon his seat which totters under the weight s condition, and the prude lets down her veil at the sight of itecture once more vested after the fashion of the Baby- an lady in the Apocalypse perchance. The architects will ently have to join hands with the painters and sculptors admit them to their confidence, not autocratically but estly, and use them and consult them also, even about itectural design; for it is all very fine for architects (or lers, as they should properly be called) to imagine them- es supreme in the knowledge of their own work (I do not n the specification side of it, but the artistic), because there a few painters yet among us who would not be afraid to r into the lists in competition with them either upon the tion of construction or design, notwithstanding the gibes 1 American or two. The whole tendency of artistic growth ide and far-reaching; its tide is setting strongly, too igly to be stemmed by a clique of architects, a few painters an amateur debate in the House of Lords. If the painters sculptors hold together the architects and the public must w, in time: and when the "Triad" is accomplished a mittee of taste to be represented by Lord Wemyss will not uch in requisition, and we shall not have to appeal to him instruction; yet we wish for him every opportunity of cising his favourite pastime of setting the world in order.

CASTEL BERANGER.

O private building among those recently erected in Paris has excited so much controversy as the so-called Castel nger, of which M. Guimard is architect. In it many cted principles have been set aside. As much can be said veral other modern buildings in Paris, but the Castel, on int of the defiance it announces, may be considered as ie. It has been made the subject of many newspaper es, and to-day we believe M. Guimard is to expound the y he adopted before a fashionable audience. The sketch

entrance, which is taken from *La Construction*, will it the architect's courage in ignoring the accepted rules nmetry and statics. The iron bars are arranged in ul lines, but the weight is not evenly distributed, gh of course provision is made against any disturbance n.

THE EXCAVATIONS IN ROME.

A CORRESPONDENT of the *Globe* writing from Rome on May 5 says:—Good fortune seems to attend the archæological operations at present being proceeded with in the Forum. Following upon the important appropriation of the site of the Basilica Æmilia, owing to initiative entirely British, comes the good news that the ugly seventeenth-century church of St. Lorenzo in Miranda, which for centuries has disfigured the beautiful Temple of Antoninus and Faustina, is to vanish, so that the blue sky will again look through the splendid columns of its portico. The origin of the name "Miranda" as applied to this church is obscure. Some old writers say that "Miranda" was the name of the lady who founded it; others, that it was so-called because it was surrounded with so much that was wonderful. The first mention of it takes us back to the Pontificate of Urban V., who, bent upon restoring the Lateran after its second destruction in the fourteenth century, granted leave to his "Fabbricatori" to plunder the temple, provided they did not interfere with the church of St. Lorenzo. No doubt they stripped the walls of the "cella" of their Parian coating as well as the flight of steps that led from the temple to the "Via Sacra." Martin V. in 1430, finding the church in a wretched condition, transferred it to the Guild of "Aromatarii," or apothecaries, granting them all the rights previously enjoyed by the canons, whom he suppressed. The worthy apothecaries now erected a set of chambers, and a chapel attached to them, between the columns of the portico, for the benefit of reduced members of the guild. The deep scars left by the sloping roof of these tenements are revealed in any modern representation of the building.

Their tenure, however, was not of long duration. When Charles V. made his triumphal entry into Rome, the authorities caused them to be done away with, so as to reveal the imposing beauty of the columns they concealed, which are the largest of their kind in Rome, being ten in number and 50 feet in height. In 1602 the guild, in consequence of increased prosperity, set to work once more and erected the present church of St. Lorenzo.

Cipollino (or Croystian) marble, so-called from the resemblance of its grain markings to "cipolla," an onion, was the fashionable marble during the Antonine period. For there were fashions in marble, jnst as we modern English have had fashions in wall-papers. The frieze will be recalled owing to its exquisite design of alternate griffins, vases and candelabra, sculptured in Parian, which is a copy of one far more ancient in the island of Delos. The three lowest stairs of the portico, which descend to the "Via Sacra," have now been entirely cleared of rubbish by Signor Boni; so that not only is the majestic flight of them up to the temple seen for the first time for at least fourteen centuries, but the actual width of the "Via Sacra" in front of it is likewise for the first time accurately made known.

But apart from archæology, this splendid temple survives as an unique example of an Imperial love-story. There is none other in Rome left to rival it, for love and reverence are here absolutely enshrined together. Antoninus adored Faustina, and raised this temple in her honoured memory. The Senate upon his death conjoined his divinity to hers with an inscription which "he who runs may read." These two together made the twentieth and twenty-first of the consecrated members of the Imperial Order, Faustina being the eleventh lady. The temple was administered by the appointed "Sodales Antoniniani" and their "flamines," or "kindlers," who, as Spartianus tells us, during the subsequent empire presided over the cult of deified emperors.

GLASGOW ARCHITECTURAL ASSOCIATION.

ON May 2 Mr. Thomas Ramsay read a paper on "Some Points in the Erection of a Modern Office Block." In his introductory remarks the author said a building of this class was erected in the first place with the specific purpose of making money for its owners, with occasionally the further purpose of serving as an advertisement. The requirements necessary to allow of its doing so the author considered to be good situation or site, ease of access, good light, maximum of rental area, ease of rearrangement to suit tenants, and the minimum of cost consistent with true economy. The author enlarged on these several requirements, pointing out, among other things, the necessity for the introduction of a certain amount of fire-resisting, if not fireproof, material in the construction and the absolute necessity of good light, this latter requirement, in his opinion, considerably affecting the money-earning capacity of the block. A vote of thanks to Mr. Ramsay was accorded at the close.

The Subject selected for the competition for the Prix de Rome in painting is "Hercules between Virtue and Pleasure," and for sculpture "Adam and Eve before the Body of Abel."

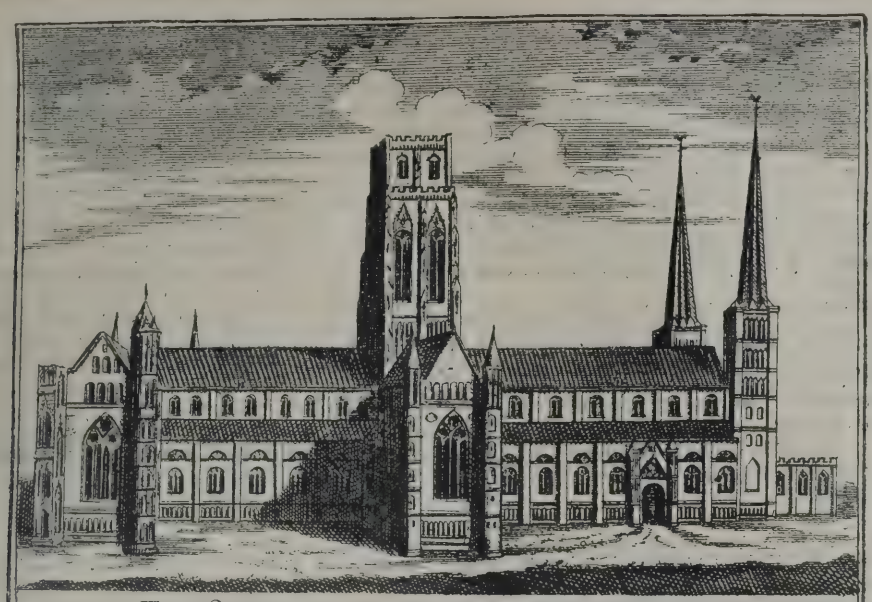
NOTES AND COMMENTS.

AMONG the old English painters there is not one who is less frequently mentioned than ROBERT STREATER. He was born in 1624, and was described by GRAHAM as "the greatest and most universal painter that ever England bred." SANDERSON also said of him:—"Of our own nation I know none more excellent but STREATER, who indeed is a compleat master therein, as also in other arts of etching, graving, and his work of architecture and perspective; not a line but is true to the rules of art and symmetry." He was much employed in Oxford. Among his works are the ceiling paintings in the Sheldonian Theatre. A poem which described them said "that future ages must confess they owe to STREATER more than MICHEL ANGELO." But unless a fairly large sum is expended there will be no paintings for future ages to enjoy. The pictures are on canvas. PEPYS saw them on February 1, 1669. He went to STREATER'S house, where he "found him and Dr. WREN and several other virtuosos looking upon the paintings which he is making for the new theatre at Oxford, and indeed they look as if they would be very fine, and the rest think better than those of RUBENS in the banqueting-house at Whitehall, but I do not so fully think so." WALPOLE considered the work to be very mean. According to the report of the curators of the theatre, the paintings are considered by Professor CHURCH to be in an unsatisfactory condition. That is not surprising when it is said they were thrice restored, viz. in 1762, in 1802 and in 1826. In 1802 WREN'S roof, reported as "in a state of dicay," was entirely removed and a new roof, externally at any rate "extremely dissimilar," was substituted for it. Among other alterations, the series of oval dormer windows which surrounded the original roof and which appear in LOGGAN'S print, as well as in the frontispieces of books formerly issued by the University Press (the work of which till 1714 was carried on in the space above the painted ceiling), were entirely removed. The curators observe that the paintings of the roof formed part of WREN'S original design, and were certainly *in situ* when the theatre was opened on July 9, 1669. They hope to be able to prevent the progress of any further injury, but it will be a difficult and expensive process.

STUDENTS of architecture in Sheffield do not appear to be more eager to devote their evenings to study than those in other places. Several keep aloof from the local society of architects and surveyors. This is seen from the Council's report, which says:—"It having been brought to their notice that in some of the offices in the city there were assistants and pupils who were not members of the society, the Council issued a circular to the members calling their attention to the matter, with the hope that the reminder would result in a useful accession of members to the society. The Council again express the hope that all members will do their best in this direction to promote the strength and usefulness of the society." It would have been wiser if the report explained how the strength and usefulness of the assistants and pupils would be increased by joining the society. There is a library containing some useful books, but there is not so much interest taken in it as it deserves, although members can have the additional privilege of using the School of Art library. In another case there was not only indifference but discourtesy. Arrangements were made with Mr. STANNUS for the delivery of a course of twenty lectures. Twenty-three members promised their support, but the Council were disappointed, "many of those who gave in their names not having made a single attendance." As a consequence a loss of 16*l.* 10*s.* was incurred. It is, however, acknowledged that "the lectures have been both interesting and instructive, and those who have attended have been more than satisfied."

ONE of the oldest bridges in Europe is that crossing the Danube and uniting Ratisbon with the suburb Stadt am Hof. It consists of fifteen arches, and the total length is 994 feet. The piers are supported on piles which are protected by jetties and large starlings. The practical NAPOLEON perceived its defects as soon as he saw it in 1809, and said it could not be worse constructed if the navigation was of any importance. The roadway is very narrow, and the footways allow of only one person to pass along them. But the bridge, with all its defects, is a relic. It was commenced in 1135 by Duke HENRY THE SUPE[illegible], and was completed in 1146. In the Middle Ages it w[illegible] considered to be one of the wonders of the builders' [illegible] and the strongest of all in Germany. HANS SACHS, t[illegible] poetic shoemaker of Nuremberg, sang its praises a[illegible] declared there was no other comparable with it. But t[illegible] needs of the time are not to be set aside through a love f[illegible] antiquity, and it is almost resolved that the bridge m[illegible] make way for another which is more in keeping w[illegible] modern engineering. Navigation must not be impeded [illegible] these busy days, but the destruction of the bridge will [illegible] another blow inflicted on archæology.

ALL visitors to Paris remember the small cannon in [illegible] Palais-Royal which is supposed to inaugurate May by s[illegible] discharge at noon, and to continue to mark that time wh[illegible] summer lasts. This year PHŒBUS was not friendly, and [illegible] doubt many superstitious people—for they are not entir[illegible] extinct in Paris—believed the silence of the cann[illegible] boded some coming danger to France. On Friday l[illegible] however, the sun was propitious, and the welcome bo[illegible] was heard by the shopkeepers, nurses and excursioni[illegible] and watches could once more be regulated by celes[illegible] time. The cannon has its history. It was presented [illegible] 1786 by one ROUSSEAU. It was therefore somewhat ca[illegible] novelty in the early days of the French Revolution. It is well known to CAMILLE DESMOULINS. In those days t[illegible] stood near the spot where the entrance to the theatre [illegible] now found, and it was not until 1800 it was transferred [illegible] its present position. It is a public treasure, and costs [illegible] State about 8*l.* a year.



A MEETING of the Shoreditch Vestry was held on [illegible] 2nd inst. The town hall committee reported that they h[illegible] considered the merits of the various competitive desi[illegible] submitted by architects in response to their advertiseme[illegible] for the proposed extension of the present town hall bu[illegible] ings. They had unanimously placed first in order of [illegible] merit design No. 2, and the second place was assigned [illegible] design No. 3. The committee therefore recommend [illegible] the Vestry to confirm the selection. The recommendat[illegible] was duly adopted. On the opening of the sealed envelo[illegible] containing the names of the competitors, it was found th[illegible] the author of the design placed first was Mr. WILLIAM [illegible] HUNT, of 12 Bedford Gardens, Kensington. Messrs. SPALDING & CROSS, of Cheapside, prepared the desi[illegible] which obtained the second place.

THERE could hardly be found any stronger testim[illegible] to the decline of Johannesburg than is afforded by [illegible] report of the town engineer for 1898. Mr. ABURR[illegible] expresses a misgiving that the erection of buildings [illegible] never again be so rapid as in the years 1895 and 1896. [illegible] 1893 there were 1,094 new buildings, and in the succeed[illegible] years the numbers were 967, 1,978, 1,964, 784 and [illegible] The last, which represents 1898, is a significant co[illegible] mentary on the Government of the South African Repu[illegible] There is no security, and strangers consequently declin[illegible] to risk money in building. Let more justice be shown [illegible] "Uitlanders," and Mr. ABURROW would have to ackn[illegible] ledge he was no prophet. Another sign of the condi[illegible] of affairs is found in the reduction of the engineer's a[illegible] owing to the condition of the finances. The Tr[illegible] Council were eager to raise a loan of 150,000*l.*, n[illegible] although 5 per cent. was offered, no satisfactory offers [illegible] received. Nor can it be said there is encouragemen[illegible] building by the authorities when we find that in all ca[illegible] where it was proposed to erect a verandah or balcony [illegible] a public footpath, or a cellar opening under a public [illegible] path, the applicant was obliged to sign an agreement [illegible] he would provide and lay kerb, gutter, and paving [illegible] whole length of his property in consideration of [illegible] Stadsraad's approval. It was not specified that the [illegible] gutter and paving had to be maintained by the appli[illegible] and under the circumstances the people were not like[illegible] undertake the responsibility. To overcome the difficul[illegible] additions have been made to the building by-laws.

MINLEY MANOR, FLEET, HANTS.

The Cathedral Church of Durham

DURHAM CATHEDRAL.

'HE plate of the chapter-house, published this week, affords another instance of the apparent advance in the of vaulting which was exemplified in Durham, and which icipated the work of a later period elsewhere in England. e structure is now in so sound a condition, it will hardly be dited that a century ago the chapter-house was condemned a dangerous structure. Its true state at the time may be ged from the following description by John Carter:—

"Entering into the chapter-house I encountered one of the ud examples of the Saxon species of architecture, and which ne would have established the skill of those of our ancestors, e this room the only proof of their high abilities. At the t end or entrance an elaborate doorway and an open window each side (through which spectators from the cloisters might v the interior to very great and pleasing advantage); over m a large pointed window (of a late date). The north and th sides of the room decorated by columns and interlacing nicircular arches, continuing their course likewise round the tern end, where, in the windows, I perceived other late- ught pointed arch-style tracery. Groins in a peculiar way ng from a second tier of low-clustered columns and porting statues; likewise a treble rise of stone seats, hitheatre-wise, filling the whole of the basement line his noble building. Also in the centre at the eastern , breaking the above course of seats, the stone seat instalment for the bishops of this see was placed, along the pavement lay many gravestones of some he most eminent of such dignitaries, and their readings legible. Reverting to the sides of this room again, there two doorways; that on the north side gives admittance to aforesaid parlour, and that on the south side into the on for offending monks. While busy in making my rior and interior views, architectural details, &c., of this pter-house, no appearance came athwart my sight to make conclude that any part of this building was in a decaying angerous state (allowing for some honeycombed courses of e at the east end, of no material consequence otherwise unpleasing to the eye)."

The view of Durham Cathedral given above is reproduced n an old engraving in the collection of Mr. T. Drew, R.H.A.

ARTISTS' GENERAL BENEVOLENT INSTITUTION.

N Saturday evening, in the unavoidable absence of Lord Tweedmouth, the chair was taken by Dr. Farquharson e 84th anniversary dinner of the Artists' General Benevo- Institution, which was held in the Whitehall Rooms of the el Métropole. Among those present were Sir Wyke liss, Sir John Tenniel, Sir E. J. Poynter, P.R.A., Sir Elliott s, M P., Sir Squire Bancroft, Mr. Marcus Stone, R.A., Mr. rew Carnegie, Mr. Onslow Ford, R.A., Mr. Fildes, R.A., McWhirter, R.A., Mr. Ouless, R.A., Mr. Waterhouse, ., Professor Aitchison, R.A., Mr. E. T. Reed, Mr. W. L. mas, and Mr. Douglas Gordon (secretary).

The Chairman, in proposing "Prosperity to the Institution," l that before any aid was granted from the institution's funds proof was required of a certain amount of artistic merit. The committee worked quite privately and confidentially, and nobody knew who were receiving aid. During the past year relief had been granted to 200 applicants, the amounts given ranging from 70*l.* to 10*l.*

Sir Elliott Lees proposed "The Royal Academy and the other Societies connected with the Fine Arts."

Sir E. J. Poynter, in responding, said that he felt doubtful whether the many local exhibitions of works of art now held had any real advantage or advanced the cause of art. They certainly offered facilities for production and enticed many into the ranks who could never rise above mediocrity. It was certainly a cause for congratulation that, to judge from the works sent in for this year's Academy exhibition, the limit of the flow of production had probably been arrived at.

Mr. W. L. Thomas also responded to the toast, after which Mr. Waterhouse announced a list of subscriptions and donations aggregating 2,310*l.*, which included a donation of 100*l.* from Mr. Andrew Carnegie.

ART AND NATURE.

ON Saturday afternoon Mr. T. C. Horsfall delivered an address on art before the Associates of the University Settlement of the Manchester Art Museum. He said the universe was roughly divided into two great provinces—nature and art. Art was not nature; it was skill and what was made by skill. It was only form, and good art was effective form. Art was not imitation, but the expression of an impression. It was a language. The fine arts were the products of those kinds of things which, if effective, contain beauty. They embrace poetry, music, prose, oratory, pictures of all kinds, sculpture and architecture. Whenever human beings lived under conditions which were healthy and surrounded by beautiful objects, whatever they made would be made beautiful. Pretty carpets, locksmith's work, bookbinding, ordinary tobacco-boxes and wall-papers were among the things which showed this influence. It was a general belief that we could get on very well without pictures and good fabrics—that they were things which could easily be dispensed with. There could be no greater error than this. They were essentials, especially to town dwellers, to right living. The fine arts were as much a language as that which was spoken or written. It was important to realise this, as there were certain feelings and impressions which could not be put into written language. A well-painted picture of a sheet of water was always beautiful, and to look at beautiful things was always refreshing. Our thoughts were turned from such gloomy surroundings as we had in Ancoats. If one talked for a year it would be impossible to convey the same feeling which an artist could, in a few hours' work, convey. It was impossible for an artist to reproduce all the detail of a large landscape scene. There were thousands of things which could be seen individually, and though the painter possessed the proverbial amount of patience, life was altogether too short to attempt it. A good many people found interest in discussing whether photography belonged to the mechanical arts or to the fine arts. "If," said Mr. Horsfall, "there be selection, and the production of a pretty picture be the result, you have undoubtedly a work of art."

SPECIFICATIONS.*

(Concluded from last week.)

WHERE should provisional amounts and prime cost items come in a specification? Should each amount come under the trade in question to which it refers, or should they all in a body be put together? I think no hard-and-fast rule can be applied to this, but small provisional amounts should run on with the subject-matter to which they refer, and distinct and perhaps more costly provisional amounts, and of which there may be no other description in connection, should be all placed together under the one heading, "Provisional Amounts," either immediately following the preliminary items, or else at the end of the specification.

The general run of "Prime Cost Items" usually apply more to small matters, and these, I think, should follow the items to which they refer. But if of any considerable amount, I would then put them also under the heading, "Provisional Amounts."

Should a specification have an index similar to that provided with a technical or scientific work? I think this would be very useful, and it certainly would make a specification a more complete and handy document. The index need only refer to the principal items.

Sometimes it is difficult in a specification to locate the description of a particular part when there is no distinct mark or name on the drawing. Some employ the points of the compass; this is very well if they will apply, but when you get a position perhaps centrally situated it rather fails in its object. I prefer in such cases to put a number or a letter, and that perhaps in a circle, against the part in question, and so refer to to it in the specification. Many of these references will not be required, as the drawings will generally be sufficiently clear to locate the descriptions by referring to the ordinary parts of the building by name or position.

Should an old specification be referred to when describing the work relating to another building? I think only so far as the general clauses are concerned, such as those under the preliminary items, the preambles to the various trades and the other general covering clauses under those trades. But the details of the work I would write entirely in the first place without any reference whatever to a former specification. All detail descriptions cannot be exactly alike, and you will be far more likely to put in any necessary variation of the detail in question if you think it out as you go along than if you copy an old description and alter it afterwards to suit, because when you copy an item you cannot properly be thinking out the details yourself.

To obviate omitting, so to speak, any of the general items common to all work, have by your side a form or tabulated index of the items coming under the various trades. This can be looked down at a glance, and all the items extracted which may be required.

There is one word in a specification of which the meaning is often disputed. It is the word "best" when applied to workmanship and materials, especially to materials, and is, I grant, somewhat ambiguous. But I would not use such terms as "best finest," "extra best," "super best," "best best," and so on, but merely employ the word "best" once and for all, and attempt to define its meaning.

Here is a suggested definition of this word:—The word "best," as applied to materials, articles, and workmanship shall mean that there is no superior quality of material or finish of article in the market, and no better class of workmanship obtainable.

In fact, by defining this word "best," it will only be necessary to mention it in the one clause when stating that all materials and workmanship are to be of the best quality and class.

We are all apt to fall into the error of describing certain materials mechanically, such as timber from a market which has long since been entirely exhausted, or stone from a worked-out quarry, or we use misleading and exaggerated language, "timber free from knots," demanding what, in our own minds, we never expect to obtain. We should only specify what we can get, what we mean to have, and then see that we get it. At the same time we must not lose sight of the fact that our endeavour must be to obtain the most suitable and best material procurable in the market, and that the work when executed shall be a credit to all.

As to the question of sub-contracts, this, I fear, would take some time to discuss, but, as a general rule, let a sub-contract go through the general contractor; but when this is impossible, then make the sub-contractor subject to all the conditions of the main contract equally with the general contractor, and in the main contract stipulate that the general contractor is to give every facility to the sub-contractor and allow him the use of his scaffolding and plant.

Having now, so far, settled the general scope and bearing of a specification, the next step is to put the various items int order and place. As I have before said, we cannot do bette generally, than divide the specification into separate heading or trades as they are called. As to the order in which the trades should be placed, I do not think that very importar only let each trade, if possible, come in the order in which tl building would be erected.

Thus the specification would be started with the prelimina items or general clauses, under which heading would con every item that would apply to the building generally as whole. Then would follow the trade of excavator, this beir the first start of the actual work. Then the trades embracir the structural parts of the building, such as bricklayer or maso whichever trade would chiefly apply to the walls. In lil manner you would go on constructing the building on pap until it was roofed in, when the trades taking the interi fittings, finishings, and requirements would follow, and fina the decoration and painting.

As to what items each particular trade should embrace, how many trades the specification should be divided into, th to some extent would be a matter of convenience and clearne consequent on the nature of the building in question. Thus, pavior is a considerable item, make it a separate trade, but if very minor point then the paving may come under the trade bricklayer. Again, if the drainage is a large item, I wou make that a distinct trade, instead of putting it, as it is oft done, under excavator. Further, floor and wall tiling mig either come under pavior, bricklayer or plasterer, as each these trades in certain parts of the country is performed by tl same class of workmen. Many other items may be treated the same manner.

Each trade is started with a preamble or the gener clauses mostly applicable to all the items under that trade, su as the description of the various materials, and the gener covering clauses referring to similar parts of the work different positions; after which follow in detail the actual iten of work. Strictly speaking, a preamble is an introduction preface, but in a specification the term is applied in the sen of denoting the general clauses and descriptions at tl beginning of each trade.

Going more fully into the various items of almost simil description under each trade, I think the best plan, in mo cases, is to describe all the items of a similar nature to ea floor separately, from the lowest to the topmost storey, co tinuing with other similar items on each floor. But if th description of any item will apply equally over the whole of th building, describe it so, without reference to each separa floor, and thus save useless repetition. As to the exact ord of the various items under each trade, I would put them as f as possible in that order in which they would be built. B there is no hard and fast rule to follow in this respect, as many cases it will be clearer to run them on, regardless of th order.

When describing the items do not omit to mention the cla of material, thus state the particular quarry and bed of ston give the class of wood for the timber and joinery work, an state whether it is rough or wrot. A general clause, such a this, "that all exposed faces of timber and joinery work excep where otherwise mentioned are to be wrot," will save repetitio of this word "wrot."

State if you mean Portland or other kind of cement, th word Portland is often omitted.

And all other descriptions of materials should be clearl defined.

Reverting once more to what is considered the best ord in which to place the items of work under the various trades, know that this is one of the chief difficulties of the beginn and I will suggest an arrangement for some of the princip items. I have before mentioned that, as a rule, it is best specify the items in that order in which the work will be bui but that it is not always possible to carry out that order. B I would say that whatever order you once adopt, always follo it in all your specifications and in all its parts, so that you w know yourself where to find an item.

I have also said that each trade in every case should sta with a preamble, or the general clauses and description materials.

Now, to take the principal items under the various trad respectively.

In *Preliminary Items* I do not think any particular order essential, but it would be as well to keep the clauses in th order which would mostly run with the order of the work the building. If old buildings have to be removed t description would come under this heading of preliminary items. But if a housebreaker is employed then this wo would form a separate and distinct contract by itself.

In excavator, take the surface excavation first, then t deep excavation, such as that to basements and cellars; th the general excavation to the foundations and the attendi t items, such as planking and strutting, filling and rammi and finally any other small or particular items. Then descre

* A paper read at the meeting of the Architectural Association on April 28, by Mr. G. B. Carvill.

e concrete foundations, after which the surface concrete and y brick rubbish under, then the concrete floors, roof, and irs. If the walls of a building are in concrete I would take ese immediately after the concrete foundations, of which they en would almost form a part.

Under drainage describe the manholes first, then the pipes th the concrete, then the gullies and other similar items.

The items under the trade of pavior are so simple that any ler might serve, but take first the important items of internal ving, and follow on with the smaller items, and finish with external paving.

In bricklayer, commence with the general walls of the ilding, then the damp-course, hoop iron, and other attendant ms. Then those parts in cement, such as rough arches, mmer arches, piers, sleeper walls, half-brick walls, and dry as. Then the external facings and pointing, gauged or ier external arches, dressings, mouldings and ornaments, ernal glazed brickwork, or flint facings. Then the internal ings and pointing, glazed brickwork, and wall tiling. undary and retaining walls and such-like distinct items uld come last, and be described separately and completely themselves. Terra-cotta facings might either come with other external facings or be kept as an item by itself after description of the other general work, and before such ms as boundary or other walling.

In mason commence with the rough stone, such as tem-tes and corbels, if not elsewhere described, and follow on h the thresholds, sills, copings, internal pavings, staircases, rths and chimney-pieces. Then the external paving, steps l curbs. If the walls are built or faced in stone I would cribe these first completely, with all the labours, mouldings l ornaments on them, and then follow on with the rough nes and internal items, and finally with the external items, h as paving, steps and curbs. I would not trouble to keep stone of a similar nature under the one heading, unless it uld happen to come in that order.

Many make carpenter and joiner two trades. In a large rk perhaps it is better to separate them, but in a small work ould certainly keep them together. But it is immaterial ether they are separated or not as long as the descriptions clear. Personally, I prefer them generally under one ding ; you will perceive the reason from the order of the ns I will now give you under these trades.

Lintels, bressummers, posts, cradling, floor and ceiling ts and plates, sound boarding roof or flat timbers, felt, tens, gutters, and all external joiners' work to the roof or s, except windows, doors and skylights, such as rolls, fascias, ge-boards and such like items. Then would come quartered titions, followed on with floorings, windows, skylights, ernal doors, internal doors, framed partitions, skirtings, loes, wall and ceiling panelling, staircases, sinks, water-sets and bath casings, and other internal fittings, such as lves, cupboards and such-like domestic fittings.

Fencing, weather-boarding or other outside work should be plete items by themselves, and come last.

Half-timber work, with all its attendant items, might, I ik, come after the description of the rough timbers.

I would not separate hard woods from soft woods, but cribe them as they come on each separate storey.

In smith and founder take this order—lintels, chimney-bars, ps, girders, floors, columns, roofs, carriages, iron windows, ers, stack-pipes, external railings and gratings, stoves and ges and heating. Heating may come under heating engineer.

Under slater and tiler, roofs first, then vertical slating or g, shelves, cisterns and such like smaller items.

In plumber take gutters, flashings and other roof finishings, s and their gutters and finishings, then drinking water supply es, cisterns, sinks, lavatories, baths and fittings. Then water-et supply pipes, cisterns, water-closets, slop sinks, urinals fittings, soil and ventilating pipes, hot-water circulation.

Zincworker and Coppersmith.—Take flats, gutters and shings, pipes, lightning conductors.

In plasterer describe first the general plaster work to ceil-s, partitions and walls, then follow with cornices, coves, tre flowers. Then those parts in cement, and finally, the rnal plaster or cement work, or if preferred take the rnal work first.

Glazier.—External glass to skylights, windows, doors, then rnal lights and screens, and pavement lights last.

Painter and Paperhanger.—Internal work to ceilings, walls, d and ironwork, and polishing. Then external painting to d, iron and cement work.

As to the order in the trades I have not mentioned, such as hanger, gasfitter, and electric-lighting engineer, which are generally of any considerable variation, there is very little uggest, but keep the order of the work, such as the main ns first and fittings afterwards. The order adopted in bills quantities is not precisely the same in all parts as that of a cification. The order in quantities is placed to an extent to ilitate the pricing, and the order in the specification should to distinguish quickly the position of the work.

One word before I come to the last part of this paper. If the prices in a bill of quantities are not to be taken into account in the settlement of extras and omissions, or if quantities have not been supplied, then a schedule of items should be provided for the builder to fill in and be attached to the specification and form part of the contract upon which variations may be valued.

I have now, I think, stated the various points which are necessary to be observed for efficient specification writing, and I will just mention a few matters which are worthy of attention and which are not always found to be clearly stated in a specification, but are sometimes omitted altogether, taking preliminary items first.

Always state that the plant and temporary erections are to be removed when directed, such as the scaffolding, hoarding, shoring, clerk of works office, and any other items temporary in their character. The provision of these items is usually stated in the specification, but their removal is not always mentioned.

State if the hoarding is not to be let to an advertisement contractor.

Clearly define what you mean by prime cost and provisional amounts.

State if the employer's business is to be carried on during building operations.

Mention that the contractor is to give due facilities to other tradesmen who may be employed on the premises, and also that the contractor is to allow such other tradesmen the use of his scaffolding and plant.

State to whom any coins or curiosities found on the premises or during the excavations are to belong.

If the contractor has done any work previous to signing the contract, then embody this work in the contract, otherwise an extra may be claimed for some small items which at the time of signing the contract were understood to be included in the contract amount.

Excavator.—Where the foundations in a length of walling are not all one level, require the excavation to be in steps, and not on the rake. Stipulate that there should be no excavations for ballast or sand unless necessary for the actual excavations, as this may affect the stability of the building.

Specify that brick rubbish be put under surface concrete which receives wood-block flooring or paving. There will then be less liability of damp coming through. In clay soils require the foundations to be taken down below the action of the weather. This may necessitate the foundations being taken down some 4 feet, 5 feet or 6 feet below an otherwise good bottom. Specify a proportion of coke-breeze, slag or gypsum in concrete fireproof construction. It will the better resist the action of fire.

State that all foul earth and cesspools are to be removed and the excavation filled up with clean rubbish or concrete. Encase new drain pipes in concrete. If a slight settlement occurs they will then the better hang together. Half-channels in manholes are better formed in cement than with half-pipes. A cleaner flow of sewage can thereby be obtained.

Then as to the items under bricklayer. Do not forget to mention these points:—To tie the walls in; to build external walls hollow, if possible, but in damp situations certainly ; and specify the lead covering over the heads of doors, windows, or arches, coming within the hollow space. This will prevent the wet being communicated to the inner thickness of the hollow walls. Describe a weather joint externally to brick walls. Build the brickwork up in even heights and fill up all the joints. Let the sand be free from dirt and the water clean. Sea water or sea sand may be used where dryness is not essential. Build chimney stacks, where they appear above the roofs, either partly down from the top, or else wholly in cement, preferably the latter. Build all parapet walls and the brickwork immediately under the eaves a certain distance down in cement, and a second damp-course here and to chimney stacks will not be amiss. Half-brick walls should, of course, be built in cement. Boundary fence walling should have a damp-course, and preferably be built in cement.

In retaining walls against earth do not omit the weeping drains or other device for taking off the accumulating water at the back.

Smoke flues should not be too large—9 inches by 9 inches is sufficient for most fireplaces—and gather the brickwork quickly over the fireplace openings. Build all stoves around solid, and fill up the boxings to chimneypieces. Fires have often occurred through neglect of this precaution. Do not put too long a description to terra-cotta work because it may be the custom. Put a straight joint between connecting walls and a heavy tower, and do not attach a large chimney shaft to the main structure.

Mason.—Stone templates should be of considerable area and tooled and not left rough. In fact, any stone upon which work is built should be tooled as a least labour on it.

Do not forget the cement packing between the rivet heads on the top of flange girders and the cover stones.

Stone hanging steps are almost better placed in position

and pinned in after the building is up, sand courses being left in the brickwork for this purpose.

In stone columns or pilasters the apophyges should be worked on the shafts. The effect is better.

Portland cement will stain delicate marbles and some limestones.

Carpenter and Joiner.—When possible, employ wood-block flooring on the lowermost floors next the ground. The ordinary joists and flooring for this position are more liable to decay. In this latter case let the joists and plates be of oak. Put cast-iron shoes or stone bases to all solid door frames. Bed window sills on to the stone sills in white lead, and do not omit the iron tongue. The cleats to roof trusses and horns on solid door frames are sometimes forgotten. Snow boards to roof gutters will often prevent wet penetrating when snow melts.

Open casement windows outwards if you want to be perfectly sure of keeping out the wet.

The ends of timbers where embedded in walls should have a circulation of air around them. A little sap on the edges of timber exposed to the air will not be any very great source of weakness, and it will not be likely to affect the rest of the timber.

All gutters should be wide enough to walk along. Some angle fillets at the junction of horizontal and vertical planes of a roof flat will make better work than if the leadwork be turned up sharply. This remark will apply to lead gutters. In some cases it is almost preferable to put a p.c. amount for the ironmongery to each door, window, or other fitment, and select the class of ironmongery afterwards.

Slater and Tiler.—Tiles and slates without boarding under should be torched.

Smith and Founder.—Let rain-water pipes stand out about 1 inch clear of the walls.

Plasterer.—Timbers over 3 inches wide should have the arrises taken off before the lathing is nailed on; this will enable the plastering to get a better key. The walls at the backs of skirtings or any other woodwork should be plastered over to prevent vermin harbouring. The outside of all flues between timbers, floors and where in the roof should be roughly rendered over. This will be a preventive against fire. Single laths should not be lapped at the joints, as is often done.

Plumber and Gasfitter.—Do not omit the exhaust pipe to hot-water circulation, or to the heating arrangements. Keep all hot and cold water pipes well away from each other and from the action of frost. All pipes, whether gas or water, should be readily accessible, and, if possible, on the face of the walls. The furring up of hot-water pipes is chiefly found between the boiler and the circulating cylinder or tank. This portion of the piping should be easily accessible for cleansing. All horizontal gas-pipe should be laid with a fall, to prevent any condensed liquid remaining in any part of the pipes, and thereby affecting the efficiency of the gas supply. It is a good plan to fix all internal pipes about ¾ inch clear of walls, especially hot-water pipes. Do not work the hot-water supply and heating arrangements from the same boiler. Failure is almost certain.

Glazier.—All glass subject to jars should be bedded in wash-leather or india-rubber as well as in putty. One of the best methods for glazing skylights is merely to seal the glass on a bedding of putty and then to sprig it in and paint the joint over with the woodwork of the bars. It is perfectly water-tight and there is no putty on the weather side to get out of order. This plan is much adopted in horticultural buildings, both vertically as well as in the top light glazing. The laps of the glass to top light should be cut to a curve, the water being directed down the centre of the glass and away from the rebates in the bars.

Painter.—External painting, if done in the spring or autumn, will give a more satisfactory result. No painting, papering or other decoration should be done while there is a suspicion of dampness about the building.

All ironwork should be well painted over before it is buried or covered up.

A discussion followed in which the following gentlemen took part:—The president (Mr. G. H. Fellowes-Prynne), Messrs. Henry Lovegrove, F. T. W. Goldsmith, B. F. Fletcher, C. H. Brodie and Max Clarke.

STATE ENCOURAGEMENT OF ART.

ON Saturday last the tenth annual Southwark and Lambeth Free Loan Picture Exhibition was opened at the Borough Polytechnic Institute, Borough Road, by Mr. G. A. Storey A.R.A., who expressed his pleasure that the exhibition was for the future to be a permanent annual event. He rejoiced because the movement might not only be a benefit to the working classes, but might in the long run be a benefit to artists—to the makers of art—for it would show them that after all there was some use in their workmanship. Such exhibits might tend to set a value on their work, which was frequently borrowed, b was not always bought; but, quite apart from that, it mig bring out the true end and purpose of art. Art should ha another object besides trying to make an effect at a We End exhibition—another object besides catching the fancy some rich picture-buyer or speculator in pictures. It shou be the pictorial and beautiful language which expresses sor thought beneficial, some subject which interests and deligh us, which teaches us and gives us matter for thought a pleasant discourse. Such exhibitions as the present mig call for and demand works of art that should be more th gems and ornaments, and bring about a great change art. Every year they saw fresh evidences of the artis development at exhibitions—the power to draw and to pai but a dearth of ideas and conceptions to be painted. Th partly arose from the tone of modern criticism, but chie because there was not much demand for pictures with a sto among the rich picture-buyers, nor were they wanted in t drawing-room, where a lovely woman by Gainsborough Reynolds seemed more in character. But for public art, if might use the term, for art that was exhibited for the enjo ment of the multitude, canvas was wanted that would appeal all alike, and he believed that the men were ready to cor forward if such services were required of them. If it we possible he would like to see palaces of art erected in t poorest neighbourhoods as well as in the richest, for a could become a real and true friend of the people—a valuab commodity that the State should not stint to encourag Referring to the expenditure of the Science and Art Depar ment, especially with reference to art, he said the State was n stingy in its provision for art education, especially in such palace of art as the South Kensington Museum and surroundings; but, having done all that, the Sta said, "Yes, we are making thousands and thousands artists and art masters, but we do not want your art; ar to show you how little we want it, we used to gra 10,000*l.* a year to the National Gallery for the purchase fine pictures, but we found it more than we cou afford, and so we have reduced it to 5,000*l.*" Perhaps th authorities who were so anxious to do their best in aid of a education were not aware, first, that art was the best teach of art, and, secondly, that the encouragement they held out students ended in more cases than he should care to mentic in sorrow or disappointment and even disaster, many, aft years of probation wasted, finding out too late that they ha better have followed any other career than that of art. H desired to say most emphatically that if a portion of th enormous fund spent by the authorities were spent on art itse and in furthering and helping such exhibitions as that one, would do immensely more good both as regards education a the enjoyment of all. The teaching that art gave should be f the million, not for the comparatively few who were privileg to enter drawing schools. If there were a demand for art th artist would be forthcoming, and it might be left to him to fi out how to do his schooling. It did seem a strange policy f the State to say, "We will train any number of you to artists," and at the same time tell them the State did not wa their art. He hoped that a better state of things would brought about for the sake both of art and artists and of t general community.

Miss Rose Kingsley also gave an address on the value art, and Mr. Edric Bayley and others took part in t proceedings.

ROUND TOWERS OF IRELAND.*

(*Concluded from last week.*)

ONE of the last towers built in Ireland was that of Ardmo in co. Waterford, and I observed that even in this tow no provision had been originally made for a beam or fixtures f any kind to carry a bell, but the interior bore marked traces f cuttings having been subsequently made for this or sor purposes of the kind. It may have been that the bell w rung by the hand from the top storey, or that the small be of the period were suspended on a timber frame-work st ported from the top floor—at least, such an arrangement w possible. Judging of this remote and early Christian perio so far as we can glean from the meagre history of the tim the Irish ecclesiastics of the period were quite as skilled in e arts and sciences as the inhabitants of any other Europn country. It is at all events quite evident that the towers, if t chiefly constructed as places of refuge, were at least used r that purpose afterwards. Taking into account the fact th the country at the time was governed by provincial kings a petty chieftains, who were eternally at war and raiding e other's territory, there must have been but little security r

* A paper read by Mr. Antony Scott, M.S.A., at the meeting of the Society of Architects on April 27.

er life or movable property. It is a well-known fact that domestic architecture of the Middle Ages was designed and structed to meet the requirements of lawless times; it is efore quite reasonable to suppose that ecclesiastics had to to their own security and that of their effects. They ld not build their churches and dwellings within fortifications; y built in the open plains and valleys and were consequently osed to the attacks of marauding freebooters—men who d by rapine and would carry off church property with as y a conscience as that of any ordinary laymen.

Dr. Lanigan says he sees no reason to deny that the round ers were erected before Christianity, and that their title ves them to be very ancient. To this haphazard contention Petrie replies:—"I see every reason to deny that they were for not the slightest evidence has ever been adduced to ve that the Irish were acquainted with the art of building lime cement before they received the Christian faith, and architecture and masonry of the towers and that of the ient churches erected before the twelfth century, of which ne hundred still exist, are the same in every respect." Not a dow of historical authority has ever been adduced to show t lime mortar or cement or any kind other than common y or mud had ever been used in any stone-built structure erior to the introduction of Christianity, nor for some time rwards, as we have undeniable evidence that many of the y churches were of timber construction.

The Very Rev. Dr. Fahey, vicar-general of the diocese of nacduagh, in a work published in 1893 entitled the "History Antiquities of the Diocese of Kilmacduagh," devotes a pter to the subject of the round towers generally, but e particularly to the round tower of Kilmacduagh in his extensive parish. There is perhaps no writer in Ireland he present day better qualified to deal with the subject than Fahey. He is a gentleman of rare intellectual abilities, sessing the great advantage of being an excellent Celtic olar.

Dr. Fahey considers that the round tower of Kilmacduagh y no means the earliest stone building at Kilmacduagh, but e is a close affinity of style between the masonry of the d tower and that of the cathedral church, which undbtedly is one of the latest buildings at Kilmacduagh. The onry in the lower part of the tower and church may be ed cyclopean, if the term is admissible in closely-jointed n stone of great size. There is another peculiarity in the onry which I have not seen elsewhere, except in the west of the cathedral church at Glendalough, namely, a peculiar hing or checking of some of the large stones. This tower 10 feet in height, the circumference at base 56 feet, and is about 2 feet or 2 feet 6 inches from the perpendicular; in respect it is frequently compared to the leaning tower of a. The doorway measures 6 feet 10 inches high, circular ded, the arch being cut out of a single stone, the jambs ine slightly towards the top, the sill stands 26 feet from ground. The historian Archdale puts this down as leaning feet out of the perpendicular, or 4½ feet more than the r of Pisa. This is a fair sample of reckless writing. It be well explained here what I believe to be the sole and cause of the leaning of this tower. It may appear strange, it is nevertheless a fact that the ancient ecclesiastical dings, including the round towers, have practically no foot- courses and very little foundations. In the case of the er the walls at foundation are generally very thick, and in way being circular, and from 13 feet to 18 feet in diameter, be said to practically cover the whole area within the rnal circumference. The foundation at Kilmacduagh is et to 5 feet 2 inches thick. The tower is built upon soft etable earth, and very possibly upon Christian graves, as e human skeletons were found side by side, partly in the re and partly under the foundation of the tower, and facing east, which is the general mode of Christian sepulture in and. The depth of rich brown vegetable earth between lower footing course and the undisturbed virgin earth varied n about 22 inches on the east side to 26 and 28 inches on west side. It can be easily conceived that the leaning of tower towards the west was due to a greater depression sed by the immense superincumbent weight on the thick r of soil on the west than the lighter layer on the east. re cannot be the slightest doubt as to the tower having n built in a Christian burial-ground, and on the top of istian graves. Similar excavations have been made with a result in the towers of Kilkenny, Ardmore and Drumbo, &c.

Dr. Fahey states (p. 87), referring at considerable length the above excavations, that those who may accept this soning would have no difficulty in admitting that the tower Kilmacduagh was built by Christian hands and for Christian poses. Continuing he says:—"We know that the period of ce which followed the death of Tirgesius was utilised for the onstruction of the many churches that were either wrecked destroyed during the troubled period of the Danish wars, it is at that period that we find our annalists notice for the t time the existence of our towers."

The need of some such structures must have been long and widely felt. There is no question raised as to the suitability of this and similar structures of safety for ecclesiastics and their treasures. The masonic character of the tower of Kilmacduagh, the great height of 26 feet at which the door is placed, would seem to render it almost impregnable at a time when the use of artillery was unknown. It is very noteworthy that the uses of such fortresses continued to be felt even in the fourteenth and fifteenth centuries. Dr. Fahey, unlike other writers, puts his views of the Christian origin of the towers with great modesty before the public. He is, nevertheless, strongly impressed and convinced that the towers were built by Christian hands and for Christian purposes.

The latest published work which I have met with, devoting a chapter to the round towers, is "Devenish: its History, Antiquities and Traditions," by the Rev. James E. McKenna, C.C., M.R.I.A., Enniskillen. The work is beautifully illustrated and gives a fine photo view of the tower, a section to scale, as well as various details and measurements. The total vertical height of the tower of Devenish is 81 feet 6 inches; circumference at base, 49 feet 9 inches; immediately under cornice, 42 feet 7 inches; cone capping perpendicular, height, 14 feet 10 inches. The door is 8 feet 6 inches over plinth, and measures 5 feet 3 inches in height by 2 feet in width, having a semicircular arched head, the arch being formed of five stones neatly and closely jointed. The jambs and arch are decorated with a flat band or architrave. Immediately under the spring of the arch is a stout iron hook to receive the door hinge, while directly under this there is a socket to receive the heel spud of door; on the opposite side of doorway is a hole evidently intended to receive a bolt. The tower was divided originally into five storeys, the floors having been supported on offsets, which run all the way round the interior and project about 6 inches. Between each two offsets are a pair of corbels, evidently intended to support stairs. On a level with the cornice and immediately under the conical cap there is a similar string-course which could not be intended to support a floor, as the space in attic would be very limited indeed. The top storey is lighted with four square openings; each of the other storeys has one opening. The most interesting feature of the tower is the richly sculptured cornice under the cap, which displays four quaintly carved human heads over the four windows. The stones of both interior and exterior are dressed to the required course, which justified Archdale in comparing it to a "gun barrel."

Like Dr. Fahey, Father McKenna is not only of opinion, but positively certain, that the tower is by no means one of the oldest buildings at Devenish. Anyone, he says, making an inspection of the masonry of the tower and that of St. Molaise's house, will see that the more hoary antiquity is by a long way in favour of the house.

Sir William Wilde observes in his "Beauties of the Boyne and Blackwater" (p. 12):—"It is very remarkable, as we already observed, how frequently we find some of the earliest Christian remains in the vicinity of Pagan mounds, tumuli and other similar ancient structures, as if the feeling of veneration remained round the spot; and though the grove of the Druid was replaced by the cashel of the Christian, still the place continued to be respected, and the followers of the early missionaries raised their churches and laid their bones in those localities hallowed by the dust or renowned by the prowess of their ancestors. Until within the last three centuries, which may be styled the dark ages of Ireland, each succeeding generation appeared to vie with its predecessor in the elegance and beauty of its architecture. The pillar stone, enlarged and decorated, grew into the sculptured cross, the hermit's cell became the cloistered monastery, the small belfry, with its small bell and with its cashel, rose into the stately tower."

Further, at p. 146, the same respected author says:—"The conclusion arrived at by Dr. Petrie with respect to the origin and uses of the round towers of Ireland cannot be too widely disseminated or too generally known, as moreover the tower at Kells, and that at Donaghmore on the Boyne, near Navan, are even to the tourist and popular reader highly confirmatory of his views."

Having regard to these undoubted facts, and to hundreds of other unimpeachable evidences which it is unnecessary to introduce here, we may, I think, very reasonably conclude that the towers do not nor could not possibly belong to pre-Christian times, and with these remarks I pass on to give a general idea of their construction.

Description, Construction, &c.

In describing the construction and characteristic features of the towers I cannot do better than quote Dr. Petrie, for my experience is that he has most accurately described them in every detail. I found it much easier work to sit before the round towers with his book in my hands and compare his written description with the actual building, than to follow him while he combated the wild, absurd and false theories of a host of writers from the days of Gerald Barry, better known

as "Geraldus Cambrensis." These towers are round cylindrical structures, usually tapering upwards and varying in height from 50 to perhaps 150 feet, and in external circumference at the base from 40 to 60 feet or somewhat more. They have usually a circular projecting base, consisting of one, two or three steps or plinths, and are finished at the top with a conical roof of stone, which frequently, as there is every reason to believe, terminated with a cross formed of a single stone. The wall towards the base is never less than 3 feet in thickness; it is usually more, and occasionally 5 feet, being always in accordance with the proportions of the building. In the interior they are divided into storeys varying in number from five to eight, as the height of the tower permits, and usually about 12 feet in height. These storeys are marked either by projecting belts of stone, set-off ledges or holes in the wall to receive joists on which rested the floors, which were almost always of wood. In the uppermost of these storeys the wall is perforated by two, four, five, six or eight apertures, but most usually four, which sometimes face the cardinal points and sometimes not; the lowest storey, or rather its place, is sometimes composed of solid masonry, but instances of this kind would appear to be very rare. When not so, it has never any aperture to light it. The second storey is usually perforated by the entrance doorway and generally from 8 to 30 feet from the ground, and only large enough to admit a single person at a time. The intermediate storeys are each lighted by a single aperture placed variously and usually of very small size, though in some instances that directly over the doorway is of a size little less than the doorway, and would appear to be intended as a second entrance. I do not agree with Petrie in this assumption. I have never met with an example of a window over the entrance doorway which impressed me with the idea that it was ever intended to be used as an auxiliary to the doorway proper. The large window over door was more probably used for protecting the door. The door of Devenish Tower was clearly forced from the outside at some time. If there was no means of protecting the door, what was to prevent the attacking party forcing it?

In any of the views shown herewith, gentlemen present can see the real and true reproductions of many of the existing towers and can draw their own conclusions. In their masonic construction the towers present a considerable variety, which I assert goes a long way to prove my suggestion that in these buildings, as well as in every other class of architectural structures, there has been great development from things poor and simple (like the round cells and houses at the start) to the beautiful and lofty tower at the finish as ages rolled by. The generality of those which now exist are built of that kind of careful masonry called spawled rubble, in which small stones, shaped by the hammer, are placed in every interstice of the larger stones, so that very little mortar appears on the surface of the finished wall, and thus the outside of spawled masonry especially presents an almost uninterrupted surface of stone, supplementary splinters being carefully centred in the joints of the undried wall. Such also is the style of masonry of the most ancient churches, but it should be added that in the interior of the walls of both grouting is generally, but not always, abundantly used. In some instances, however, the towers present a surface of ashlar masonry (but rarely laid in courses perfectly regular) both externally and internally, though more usually on the exterior only, and in a few instances the lower portions of the towers exhibit less of regularity than the upper parts.

In their architectural features an equal diversity of style is observable, and of these the doorway is the most remarkable. When the tower is of rubble masonry the doorways seldom have any decorations, and are either quadrangular and covered with a lintel of a single stone of great size, or semicircular and headed either by the construction of a regular arch or the cutting of a single stone, hollowed out to resemble an arch. There are, however, two instances of very richly-decorated doorways in towers of this description, namely, those of Kildare and Timahoe. In the more regularly-constructed towers the doorways are always arched semicircularly, and are usually ornamented with architraves or bands on their extreme faces, and sometimes a roll moulding. The upper apertures but very rarely present any decorations, and are most usually of a quadrangular form. They are, however, sometimes semicircular headed, and still oftener present the triangular or straight-sided arch. I should further add that in the construction of this aperture very frequent examples occur of that kind of masonry, consisting of long and short stones alternately, but more generally considered by antiquaries as a characteristic of the Saxon architecture in England.

As already referred to, the stones used in the construction of the towers varied with the locality in which they were built, and consisted generally of blue limestone, which is the most general formation of the country—black calp, green clay, mica slate, a little granite, generally in doorways, as at Glendalough, and sandstone, &c. Writers of the Pagan origin school find it difficult to account for the Christian emblems connected with the towers, and to get out of the difficulty they assert that the features have been inserted in Christian times when the towers were turned to Christian use. This is a very great fallacy; experience of alterations in old buildings is that nothing more easily discovered or more plainly visible than an alteration. If we are making good a defect in an old building these days, we try to imitate the character of the old work as far as it can consistently be done; but the ancients never paid any attention to the character of the work with which they were dealing, nor to the bonding of the new work with the old for the purpose of concealing the connection.

As a proof of this I may state that the primitive stone-built churches from the days of the circular churches, without exception, were all quadrangular on plan. The peculiar oratory of Gallerus would appear to be the first transition from the round to the square, but in latter years the majority of these churches have had small chancels added to them at the eastern end in all cases, and cutting away the east end wall of the church and forming an arched opening in same to connect it with the older church, or what then became the nave. In some cases new doorways and new windows were introduced, and in all such additions, alterations or improvements there has been no attempt at imitation, bonding or interlocking the new work with old.

The round towers have been less tampered with or altered than any other class of architectural remains in the country. There are instances of alteration, such as battlemented tops to Kildare and Cloyne, the stunted capping which replaces the original conical capping, as at Donaghmore, co. Meath, and Lusk, co. Dublin. In the construction of the towers each architect seemed to follow his own fancy (except in rotundity alone), so much do they vary in height and in the disposition and number of the apertures and height the different doorways stand from the ground.

Height of Towers.

I feel assured that this was proportioned to the surrounding ecclesiastical buildings and to the requirements of the place (see quotation from "Life of S. Senan, Devenish," p. 52).

It becomes evident, when we compare the towers now remaining with one another, that very considerable developments of knowledge, with progressive skill in the art of building, may be traced in the various examples, and that the signs of change are analogous to that which took place in the church architecture of Ireland after the eighth century. The transition from coarse rubble masonry with square headed openings to neatly dressed and coursed ashlar, with circular head and moulded arched openings, has evidently been of slow growth. The remains of the existing towers might be classified into three or four distinct groups, showing the transition from those built with unhammered field boulders, and those building having circular arched moulded openings, with correctly radiated arch joints and moulded architraves, as at Timahoe, Armadown, Temple Finan, Kells, O'Rorke's Tower, Disert O'Dea, &c. The first circular headed openings in both church and tower were formed or scooped out of one large stone which formed the lintel, and was generally the full width of the wall. In the case of window openings of the churches, these were very small openings on the outside and deeply splayed on the inside. In the case of the tower openings, the top lights were seldom, if ever, splayed, but the smaller openings are slightly splayed. As regards the suggestion that the towers have been surmounted by crosses composed of a single stone we have at least one example—that of Ardmore.

In Dr. Smith's "History of Waterford," published early in the seventeenth century, he has given an illustration of the tower of Ardmore, showing the cone to have terminated with a cross, and so satisfactory was the evidence in the case that when the tower was being restored in 1875, the cone was surmounted by a terminal in the shape of a Celtic cross. At Glendalough the whole cone or cap was missing at the time the ruins were vested in the Board of Works as national monuments, but a large amount of the original stones which formed the capping were found in the burial-ground in the centre of which the tower stands. The most important stone found was the apex stone, which like that of Ardmore had a deeply cut socket about 4 or 4½ inches square, which could be there for no other purpose than the reception of the shaft of a terminal, and I think it requires no great stretch of imagination to assume that such terminal was neither more nor less than a representation of a cross of some kind. The apex stone at Glendalough occupies to-day the same position which it occupied centuries ago, minus the terminal cross. The conical cap was rebuilt principally with the old stones and the apex stone replaced, but the Government authorities in conjunction with the Church Temporalities Commissioners decided not to replace the cross, considering it more desirable to still leave the question of the Christian origin of the towers open for discussion.

One of the buildings at Glendalough is a stone-roofed church, and one of the finest specimens of its kind in Ireland.

the western gable of this church rises a small belfry tower, exact facsimile of the large round tower which stands at a ance of about 60 or 70 yards away. This building is sup- ed to be the first attempt in Ireland to unite church and er. That it has been built with the church cannot be denied ; equires no expert knowledge to prove this. Anyone can see be part and parcel of the stone roof of the church. This ll tower has an apex stone identical in every respect to the x stone of the large tower, and it has also a socket for the eption of a terminal, which terminal must have been a istian emblem, and that emblem must of a certainty have n no other than a cross. We have crosses in relief over the rways of the towers of Antrim, Donaghmore, co. Meath, Brechin, in Scotland, a round tower built by Irish sionaries, and no person will, I think, attempt to deny that se crosses in relief are coeval with the said towers. If they e incised crosses there would be room for argument, for y could be incised at any time since the erection of the ers. Having these crosses and figures of the Crucifixion ed on the lower portions of the tower, is there any valid son to deny that the conical cap of the towers terminated h a cross? So far as my judgment and experience goes, I no just reason for doubt.

I fear, Mr. President and gentlemen, that I have tres- sed too much on your patience with a subject which receives little attention from present-day architects in the rush and bustle of new developments and new patent building terials and fittings, &c. The antiquities of Egypt, Greece, ne and other Eastern countries have at all times received earnest attention of England's best architects, historians antiquaries, while those of the sister isle have been prac- lly ignored. I think, gentlemen, you will admit that this ot as it should be, and if I could only succeed in stimulating n a little interest in the subject of Irish antiquarian research, ould not consider my humble efforts had been made in vain. all conclude with a verse from the beautiful poem of Mr. is Florence McCarthy :—

The pillar towers of Ireland, how wondrously they stand
By the lakes and rushing rivers and valleys of our land,
In mystic file throughout the isle they lift their heads sublime,
Those grey old pillar temples, those conquerors of time.

ART STUDENTS AND ST. PAUL'S CATHEDRAL.

ON Saturday afternoon, at 30 Fitzroy Street, representatives from the Academy, Slade, Westminster, Birkbeck, and er metropolitan schools of art, assembled for the purpose of testing against the "Desecration of St. Paul's." That was heading of a circular issued by Mr. Max West, of the Slade ool, addressed to the art students of London, protesting inst "the atrocities of the design, the meanness of the terns, the crudity of the colour, and the vulgarity of the le," also against the treatment in Romanesque style of a naissance building, the "petroleum stencilled frieze," and e audacious demolishing of the stonework of the structure lf to provide a bed for these detestable mosaics." It was declared that since the so-called decorations of St. Paul's e been encroaching actually on the substructure of the hty dome itself, a great feeling of indignation has arisen. en good decoration would be out of place, superfluous, and erly contrary to the expressed wish of Wren. The circular t on to say that "we feel assured none who have at heart preservation of the masterpiece can submit to see the rious memory of its illustrious author thus insulted, or can less than their utmost to avert what can only be regarded as ational calamity."

Mr. Max West took the chair, and suggested first of all the irability of a public procession by way of a protest against action of the Dean and the "decorations" of Sir W. hmond ; but subsequently he thought that a petition to the an would perhaps be the best initial action. Mr. Jones, of Slade School, said there was no doubt that the stencilling uld be taken down, and a polite letter should be sent to the an stating their views. Mr. Wellington, of the Royal ademy School, said that if a petition were sent round to the students for signature, their opinions with regard to the cession could be invited. Mr. John said that the opinion of dents who had given their lives to art ought to have more ight than that of the general public, and therefore should be ivered with more emphasis.

A student of the Slade School said it was no use to expect Dean to take down the stencilling or anything else, and y might just as well make up their minds that a public pro- ssion would be necessary. They need not consider the sceptibilities of the Dean beyond a certain point, and then other student declared that Sir William Richmond had had e audacity to pervert the original lines of the building, and a otest against such desecration would, he believed, be sup- ported not only by those best able to judge from an art point of view, but by the public at large.

Eventually it was resolved that an executive committee be formed, to consist of representatives of the different art schools, in order that they might draw up a petition and consider the subject of the procession, and that Mr. Webb (Westminster), Mr. Orpen (South Kensington), Mr. Wellington (Academy), Mr. John (Slade) and Mr. West, their secretary, be on the committee. It was asked whether the procession was to be with banners, bands, &c., and the chairman said that that would be a matter for the committee to consider. At this stage a Mr. Percy Freund asked to be allowed to speak and, permission being given, he endeavoured to introduce the question of ritualism, but his observations were received with hisses. Mr. Wellington said they did not wish to bring religion or any matter into the subject, except art. It was decided to print a report of the proceedings, and to send a copy to each of fifty influential persons, asking for comment upon or an expression of sympathy with their protest.

TUDOR HOUSE, BROMLEY-BY-BOW.

ON behalf of the National Trust for Places of Historic Interest or Natural Beauty, Sir Robert Hunter has addressed a letter to the chairman of the London County Council on the subject of the proposed demolition of "Rutty's House," or more properly Tudor House, Bromley-by-Bow, E. The land adjoining the house is to be preserved as an open space, and Sir R. Hunter says that the executive committee of the National Trust contend that the amenity of the open space would be seriously impaired by the destruction of the house. East London possesses, he says, too few relics of the reigns of Elizabeth and William III. (to both of which periods much of the work may be assigned) to be able lightly to dispense with them. The committee also urge that there is no adequate reason for the destruction of the house. The addition to the area of open space obtained by removing the house would be insignificant, and the repairs would involve no great expense. It is also pointed out that another committee of the Council have indicated that the house is a building which should be preserved.

Mr. C. R. Ashbee says :—It will be remembered that not long ago the historic buildings committee of the London County Council decided to issue a register of interesting London buildings that were to be preserved if possible, and a number of experts were invited to advise the Council as to which buildings should be recorded for preservation. Among these is Tudor House, one of the last remaining of the Elizabethan houses of Bromley, a building in part of the early portion of Elizabeth's reign, and containing much beautiful work of the period, besides being connected with the Scotch colony planted in Bromley by James I. This house, with the extensive grounds adjoining, has now come into the Council's hands, and while the historic buildings committee have recorded it for preservation, the parks and open spaces committee have determined that it shall be destroyed. There do not appear to be any cogent reasons why the house should not be left alone, as it does not interfere with the open space, and would be useful as a home for the Council's servants. But house or no house, may we not ask that the point of principle should be considered? The advice of experts has been asked—this advice should have been adhered to. Perhaps the making public of the absurd anomaly by which the Council destroys with one hand the work it is seeking to preserve with the other, may save it from inaugurating the publication of its forthcoming protest against London vandalism by the destruction of one of the buildings it has itself registered for preservation.

EXCAVATIONS AT SILCHESTER IN 1898.

A PAPER was read at the meeting of the Society of Antiquaries by Messrs. W. H. St. John Hope and G. E. Fox on the 4th inst. upon the results of last year's excavations on the site of the Roman city of Silchester. A large number of the antiquities found were displayed on the table and walls. Conspicuous amongst these were a quern, with its wooden handle still remaining intact, a sepulchral urn containing burnt human bones, a tile inscribed "Satis," the usual array of pottery and some fine mosaic pavements. The insulæ (or rectangular blocks between the streets) explored in 1898 lie next the city wall on the south-west, between the small postern gate in the west wall and the south gate. As the result of nine years' work twenty blocks, covering an area of 65 acres out of a total of 100 acres within the walls, have been explored, and all the buildings found therein plotted on a plan. Between Insulæ XIX. and XX. and the city wall is a triangular piece of land (what ladies would call a gusset) which was also excavated. Insula XIX. proved to be decidedly the most interesting. It differed from all the

other insulæ in being entirely enclosed within a wall, measuring 384 feet from north to south and 271 feet from east to west. Within this enclosure was a remarkably fine house of the better class, built round a courtyard and having the usual winter rooms heated by hypocausts. Adjoining the house on the south side was a large workshop and in the yard outside were two water-tanks. Mr. St. John Hope suggested that the tanks possibly indicated the existence of a tannery. The size and importance of the house may be gathered from the fact that it presented a frontage of 166 feet to the road. At the south-west corner of Insula XIX. the sepulchral urn containing incinerated bones was discovered. At the depth of 1 foot 9 inches below the foundations of the mansion in Insula XIV. were discovered the remains of an earlier house, built partly of timber and having a very remarkable tesselated pavement. The design of the pavement indicates, as Mr. G. E. Fox pointed out, that it was probably of the first century A.D., and that therefore the house to which it belonged was, if his views were correct, the earliest yet found on the site. The ornament consists of elegant scrolls of foliage resembling the painted designs at Pompeii and on Samian ware, thus differing altogether from the later mosaic pavements in which the plait or braidwork and the Greek fret predominate. Mr. Alma-Tadema agreed with Mr. G. E. Fox that the pavement was an attempt to imitate painting in mosaic rather than the product of a true artist in mosaic. In the discussion which followed Mr. F. Haverfield said that the plan of the city as now revealed to him by the last nine years' excavation seemed to show that the builders copied a Celtic rather than an Italian model. Mr. C. H. Read, of the British Museum, called attention to the fact that none of the glass vessels dug up showed any trace of iridescence, which he attributed rather to the composition or fabric of the glass than to the conditions of their burial during the last thousand years. Sir Henry Howorth said he had for years been endeavouring to induce his friend Mr. Alma-Tadema to turn his attention to Britain during the Roman occupation, and to choose as the subject for his next Academy picture a Roman general engaged in some such really noble work as driving the Picts and Scots beyond the Antonine Wall.

THE SURVEYORS' INSTITUTION.

THE following student candidates (in Sub-Divisions I. and II. only) have passed the examination for the professional associateship :—Rowland William Alderson, John William Wilson Armstrong, Clement Joseph Bentley Bridgewater, Basil Vassar Bruton, Geoffrey Redmore Church, George Harry Cole, George Edwin Cragg, George Herbert Croft, Henry Dann, jun., John William Statterley Humphreys Davies, James Caulfeild Goff, Alfred Goodman, John Sebastian Hall, Lancelot Gouldar Hawkins, Michael Anselm Hindmarsh, George Howland, Percival Hurlbutt, Ninian P. Laird, Sydney Martin Lampard, Henry Lemmoin-Cannon, Edward Adrian Lumley, Sydney Mager, Thomas James Meaby, jun., Frank Percy Pratt, Thomas Reginald Ransom, Douglas William Reeve, Maurice Charles Riddett, Arthur Dennett Rutley, William Henry Sanday, Stanley Lunau Sandell, John Henry Simpson, John Ambrose Smith, Frank Vincent Tait, Frank Treacher Terry, Cyprian Charles Oswald Whiteley, Sydney Prudden Wigley, Arthur Codrington Williams, Thomas Henry Wright.

The following non-student candidates (in Sub divisions I. and II. only) have passed the examination for the professional associateship :—Frederick George Barker, Edmund Brand, Frederick George Brooker, William Nathaniel Brooks, Richard Herbert Chichester, Leonard Eustace Clarke, James Thomson Cole, Edward Arthur Cook, Hollis Augustus Crook, Herbert Hood Daniel, Robert Harvey Addington Delves, James Murgatroyd Dickinson, Eustace Cyril Theodore Dodd, Dugdale Oakeley Dunlop, Hugh Wicksted Ethelston, Alfred Charles Stanley Fowler, William Pope Genge, jun., Arthur John Hooley, Arthur Ernest Hope, George Whitaker Hunt, George William Calver Kelly, Albert Daniel Lomas, Dyneley Luker, Humphrey Dod Lynes, Douglas Samuel Matthews, Frederick Walter Merrick, Emmanuel Joseph Oram, Herbert Mostyn Parry, John Stonehouse Petch, Roger Prosser, Alfred Ernest Protheroe, Philip Robertson, Samuel Messiter Rowlandson, Arthur Lionel Rutter, Hubert Covell Sands, Robert Stephenson, jun., Edward Frederick Stimson, Francis William Terry, George Thomas, Richard Squire Thorne, Arthur Tighe, Henry Turner, Marcus Oswald Type, David Alexander Watson, James Bernard Witham, Donough Richard O'Brien, George Pakenham Stewart.

The following professional associates (in Sub-division I. only) have passed the examination for the fellowship in Division IV.:—Sydney Wood Ambler, Geoffrey Clinton Baker, John Bowyer Bird, John Friendship Bowden, William Newbegin Brackett, Albert Ernest Butler, Charles Tylee Cronk, Frederick Russell Fox, Robert Strachan Gardiner, Douglas Fleet Goldsmith, James Gunter, John Edward Harrison, Mackinto Meleng Holl, John Murray Kerr, William Henry Morr Roger William Oldnall, Horace Clare Waterfield, Regina Spencer Wigram, Thomas John Young.

The following candidates (in Sub-divisions I. and II. onl have passed the direct examination for the fellowship :—Frar William Booker, William Harold Eve, Samuel Brown Saunder Arthur Courtenay Scott-Smith, Thomas John Woodrow.

The results as regards Sub-division III. of the variou divisions, and the Fellowship Examination in Sub-division II Division IV., together with the award of prizes, will b announced later on.

The following candidates (in Divisions II., III., IV. and V have passed their re-examination in their typical subjects :- George Alfred Cutler, Tom Percy Hartley, Edward Robe Hinchsliff, Hudson Little, Henry Arthur Newman, Shirle Herbert Potter, Arthur Henry Tyack, Arthur Wesley Crampto Alan Herbert Howgrave-Graham, Alexander Pearson Joll Walter Bernard Laurence, Ernest William Moat, Dougla Smith, Percy Newton Wilkinson, Francis Edward Yewdal William Thomas Cresswell, Thomas William Harris Taylor.

GENERAL.

Mr. Pittendreigh Macgillivray, A.R.S.A., has bee selected as sculptor for the large statue of the poet Byro which is to be erected in front of the Grammar School Aberdeen.

Messrs. Newton & Cheadle, of Birmingham, have pre pared plans for a building in flats which is to be erected at th corner of John Bright Street, Station Street and Suffolk Street

Mr. P. W. Smith has won the travelling studentship of the Royal Manchester Institution. He is to visit Paris, Venice, Florence and Rome. On his return he is to submit the work executed abroad.

Mr. W. H. Bidlake, M.A., is the architect for the new branch of the Birmingham School of Art at Balsall Heath. The foundation-stone was laid on Monday by Alderman W. Kenrick. Messrs. Smith & Pitts are the builders.

Mr. Weir, of the Eglinton Iron Company, has presented to Kilwinning Eglinton village an institute which will cost several thousand pounds. The building will have a frontage of between 200 and 300 feet, provision also being made for the construction of a tower and clock.

Mr. Robert Whyte has been appointed clerk of works for the buildings of the Glasgow International Exhibition.

The Plans of Professor Wallot, the architect of the Reichstag, for a new States House at Dresden have not been approved, as the edifice would have considerably shortened Brühl's Terrace.

The Walsall Town Council have granted a lease of a site in Park Street, at a rent of 300*l.* a year, to the Walsall Theatre Company, Limited, for a new theatre.

Messrs. Ford & Slater have been instructed to prepare plans for the enlargement of the Bradwell Sanatorium, Burslem.

The Dublin Museum has been enriched by the following additions :—An interesting specimen of early seventeenth-century room panelling from Sweetman's Brewery, Dublin; ring with miniature, bracelet with miniatures in clasps, and ancient stone moulds for casting bronze implements.

A Paper on "The Artistic Treatment of Picture Frames" will be read by Mr. J. Hunter Donaldson at the meeting of the Applied Art Section of the Society of Arts on Tuesday next.

The Surveyors' Institution will be closed from May 16 to 25 (both inclusive) to facilitate the removal to the Society's new house, 12 Great George Street, Westminster, to which all communications should be addressed on and after May 24.

The Next Excursion Meeting of the Northern Architectural Association will be held to-morrow, Saturday, May 13. The Coach Lane new Board school will be first visited. The party will then proceed by the ferry to South Shields, where the following buildings will be inspected in rotation :—New Variety Theatre, Britannia Hotel, new residences at Westoe and Mortimer Road Board schools.

Mr. T. Ross, in his retiring address as president of the Edinburgh Architectural Association, recommended union between the Architectural Association and the junior Architectural Society. He said that so far as they existed for the public good their influence would be much greater after such a union than now, as only on one point was there any difference between the two, viz. that the Association consists of architects and laymen, while the Society is composed of architectural assistants and others connected with the profession.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

NEW READING CASE.

To Librarians of the Public Libraries and Readings.—A new handsome Reading Case can be supplied nominal charge of 2s.. by post 2s. 6d., on early lication to the Publisher, Imperial Buildings, Ludgate is, London, E.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

ESIGNS invited for a new patent stove. Premium 25*l.* ssor, Geo. B. Haite. Particulars from 159 Victoria Street, minster, S.W.

A NEW VENTILATOR.

THE "Climax" Ventilating and Heating Company have just brought out a new ventilator, which has been designed with a view to obviating the possibility of down-draughts, a result which is achieved by the use of automatic valves so placed as to allow full advantage to be taken of the natural forces of wind and heat.

This ventilator is an adaptation of Messrs. Cousland's "Improved Climax" direct-acting roof-ventilator, intended for fixing on the ridge of roof. It is guaranteed water-proof and entirely free from down-draught. It has been adapted to meet the requirements necessary for the ventilation of certain buildings, such as breweries, stables, bakehouses, foundries, &c., where condensation is likely to arise in the extraction of vitiated air and where a large area of outlet is desired at the smallest cost.

These ventilators are made to pitch of roof, with flanges under the slates or tiles, no lead-flashing or plumber-work being necessary, and consequently they can be fixed at a trifling expense. The ridge-plate does not require to be cut, the roof lining under ventilator only being cut away to allow free access for the vitiated air to the ventilator.

TRADE NOTES.

MR. GEORGE SHREWSBURY, of Calda Works, Station Road, Camberwell, is issuing a new illustrated broadsheet, on which are shown numerous varieties of his patent "Caldas" and gas baths, all of which are marked in plain figures.

THE new Isolation Hospital, Aldershot, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with ornamental tiled sides and descending smoke flues, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MR. M. H. GLOVER, a director of C. H. Glover & Co., Limited, left Liverpool on the 3rd inst. per s.s. *Vancouver* for Quebec, Montreal, the timber districts and through the States. We understand that it is his intention to combine business with pleasure.

A LARGE clock tower (presented to the town of Wainfleet by Mrs. Walter Martin) was completed and the clock formally started on May 2. The clock has three large dials, strikes the hours, is fitted with all the latest improvements and was manufactured by John Smith & Sons, Midland Clock Works, Derby.

IN consequence of the need of more light in the lending library at the Cripplegate Institute, the committee decided to have a trial of the two principal means placed before them. Messrs. P. E. Chappuis & Co. were invited to fix one of their silvered daylight reflectors as against a "Luxfer Prism" daylight refractor. The architect to the Institute had the appliances fixed at two windows, side by side. We are informed that the committee were of opinion that the reflectors of Messrs. Chappuis gave the most light, and that they have instructed them accordingly.

AT Pudsey, near Leeds, a new illuminated turret clock showing the time upon two external dials 5 feet each in diameter and striking the hours on a large bell was formally set going by Miss Crowther on the 1st inst., on what it is hoped will be a long and useful career. A silk ribbon was attached to the pendulum, which Miss Crowther cut in two with a pair of silver scissors suitably engraved for the occasion. The clock has all the latest improvements inserted, and is fixed on strong iron brackets, thus giving a firm foundation for it to rest upon. There is an index dial inside the clock chamber by which to set and adjust the outside hands, which are of stout copper balanced within. The clock was made and fixed by Messrs. Wm. Potts & Sons, clock manufacturers, of Guildford Street, Leeds, and Cloth Market, Newcastle-on-Tyne, makers of the Pudsey, Farsley, Armley, Bramley, Kirkstall and Drighlington Church clocks in the same district.

MESSRS. WILLIAM BEATTIE & SON, Edinburgh, have been entrusted with the second portion of their present contract for the construction of the Caledonian Railway Company's new line from Newhaven to Leith Docks. The amount of the whole contract is about 150,000*l*.

BUILDING AND BUILDERS.

foundation-stone of the new public hall, Commercial t, Halifax, was laid amid considerable pomp and ceremony aturday afternoon last. The cost of the building is ated at about 30,000*l.*

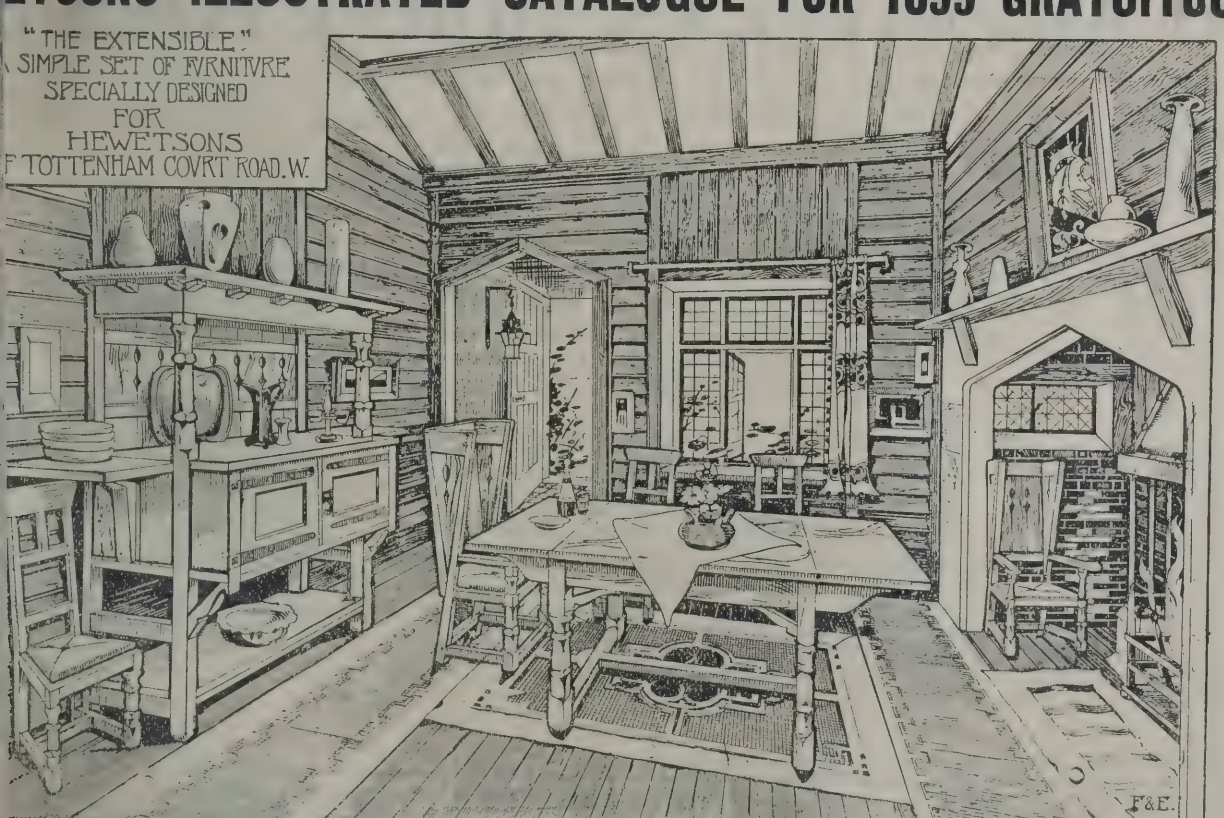
HE Newport borough engineer has prepared plans for the anent extension of the Town Hall over the whole of the ecently acquired, and the committee to which the matter eferred have agreed to recommend the Council to go on the permanent extensions, instead of mere temporary itions, which would cost 1,000*l.* The plans for the anent extension provide for additional office accommoda- in all public departments, an additional court for civil ess, and new committee-rooms. The present accommoda- s practically doubled.

URING excavating work for the Yarmouth Water Com- s new reservoir at Caister, there was an alarming sub- ce of earth. Tons of soil suddenly fell into the trench at ot where three men were working. Two of them extri- themselves and escaped serious injury, but a labourer d William Barber, a married man, had to be dug out, and fterwards conveyed in a prostrate state to the hospital, e both his legs were found to be fractured. He lies in a rious condition, suffering from the injuries and the shock.

SPECIAL meeting of the Bridlington Urban Council has held to receive the report from the deputation which had d nine refuse destructors at various towns. The report mended the Council to cause a Beaman & Deas destruc- be erected, and also recommended the adoption of air shafts from the tipping platform, and the balance-hanging ikering doors instead of hinging. Mr. Sawdon, chairman sanitary committee, moved the adoption of the report, Mr. Rennard seconded. In reply to Mr. Johnson, Mr. on said they could form an approximate idea of cost the cost of the destructor at Llandudno, which was . 12*s.* 3*d.* There was no question of site as yet, and the n was carried unanimously.

a meeting of Kirkcaldy Town Council on Monday ig, it was reported that at a joint meeting of representa- rom various bodies Councillor Lockhart moved, and Mr. seconded, that Mr. Conacher, N.B. manager, be ached with a proposal that the town, as their half of pense of a new harbour, contribute 100,000*l.*, or a quivalent to that sum if it can be got, and hand over the present harbour, valued at 50,000*l.*, or a sum to be fixed by valuation, the town having an equal share in the management with the railway company. Mr. Thomson proposed, and Mr. Maxton seconded, that in the event of the railway company being willing to make a suitable harbour at Kirkcaldy at their own expense the town should sell to them the present harbour at a sum fixed by arbitration. The joint committee ultimately agreed to meet Mr. Conacher and discuss the question with him without being committed to any definite scheme. The town clerk stated that Mr. Conacher was to fix the date of meeting.

AT the Union Offices, Wolverhampton, on the 9th inst., Mr. E. W. Wethered, one of the inspectors of the Local Government Board, held an inquiry with regard to an application by the Wolverhampton Board of Guardians to borrow 140,000*l.* to erect a new workhouse at Wednesfield. The Guardians were represented by Mr. E. Pritchard (clerk), Mr. W. Price (chairman), and Mr. T. D. Greensill. Mr. Pritchard explained that the rateable value of the union was 499,644*l.*, and that the Guardians had power to borrow a fourth of that amount. The present debt of the Board was 27,397*l.*, so that the actual borrowing power was represented by 95,573*l.* The debt included 11,128*l.*, which had been expended in the site for the new workhouse. The maximum which the Guardians would be entitled to borrow, if they took full advantage of the proposed provisional order, was 195,027*l.* The Guardians did not anticipate that the new workhouse would cost 140,000*l.*, and a margin for contingencies was allowed for, and the money would be obtained as required. Since the original estimate had been sent in, the Guardians had reconsidered their scheme, and decided to add a chapel, which would bring the cost of the buildings up to 119,668*l.* There was no opposition.



VARIETIES.

THE next congress of the Sanitary Association in Scotland is to be held in Hawick.

A NEW Baptist chapel in Tenterden Street, Bury, which, together with a school adjoining, has been erected at a cost of about 5,000*l.*, was formally opened on the 10th inst.

THE new wings which have been added to the Ripon and Wakefield Diocesan Training College were formally opened on Monday, when the new college chapel was also dedicated by the Bishop of Ripon.

HOTELS, CLUBS, AND PUBLIC INSTITUTIONS COMPLETELY FURNISHED.
WETSONS, TOTTENHAM COURT ROAD, LONDON, W.

THE new post-office buildings in Dame Alice Street, Bedford, which have been in the course of construction for considerably over a year, are to be opened for public business at Whitsuntide.

THE new Commercial School, Wellingborough, which takes the place of the old Third Grade Grammar School, under the direction of the Grammar School governors, was formally opened last week.

AT a special meeting of the streets and buildings committee of the Preston Corporation the offer of a company to take over the tramways from the Corporation and substitute a service to be worked by the overhead trolley system of electricity was considered. It was announced that it was the intention of the company to extend the tramway to Lytham on the one side and to Blackburn on the other, thus connecting Blackburn, Accrington and Darwen with Preston, Lytham, Blackpool and Fleetwood. The matter was referred to the leading corporate officials and a sub-committee to report upon at an early date.

A DISASTROUS fire occurred at St. Margaret's Church schools at Burton-on-Trent on Sunday night. It was the most extensive block of school buildings in the town. The fire was discovered about half-past five, and originated in a room used by the Sewing Guild, where a large quantity of clothing and materials were stored in readiness for a bazaar on Wednesday. Bass's, Allsopp's and the town fire brigades all assisted, but in less than two hours the whole building was practically gutted. The adjoining schools and church were saved. The water supply at starting was very inadequate. The cause of the fire is unknown. Classes had been held in the schools during the afternoon.

IN the absence through domestic bereavement of Sir T. Fowell Buxton, Bart., recently Governor of South Australia, Mr. E. H. Pickersgill, M.P., took the chair at a meeting on Wednesday in celebration of the twenty-third anniversary of the Bethnal Green Free Library, and the second year of the opening of the free lending department. Eloquent testimony was borne by the chairman, by Sir M. M. Bhownaggree, M.P., and other speakers to the excellent work done by the institution in a district whose poverty alone prevented it establishing a rate-aided library. The committee's appeal for increased financial support was heartily endorsed, and the earnest hope was expressed that the efforts being made to obtain a site contiguous to the Bethnal Green Museum might be crowned with success. Meanwhile the committee are in need of a boys' reading-room to relieve the congested state of the lim reading accommodation.

AT the Sussex County Hospital, Brighton, a large and v equipped new building which is to be used as a home for hospital nursing staff has been opened. High up on the to the hill behind the big central block of the hospital (with w it is conveniently connected by a long, glazed, covered path new house for the nurses could hardly be in a healthie more commanding situation. With its ground floor well a the level of the hospital roof, its numerous windows look ou every side on a wide, breezy expanse of sea or downs. new quarters are for the whole staff of resident nurses, contain some sixty beds. The bedrooms are of a conven size, and are furnished with a regard for the comfort of inmates that is not always exhibited in similar institutions. house is in four storeys, the top storey being set apart for night staff, and provided with a door by which it can entirely shut off from the rest of the house, and so kept in "blessed calm and quiet" that is so necessary for those have to get their sleep during the day. On each floor t is a well-fitted bathroom, and there are several sitting-ro As a precaution against fire, or rather as a means of escap the event of one occurring, there are a couple of iron stair at the back, running from the top floor to the ground out after the sensible American plan, and with an entrance at e storey. Another important part of the establishment is sick-room, which, with a view to making it more cheerful possible invalids is painted white, and opening out of it small bedroom for an attendant nurse.

A NEW church tower and bells were dedicated on the inst. at Fenton (Staffs.) parish church. The tower is buil solid brickwork, with external facings, from the works of Duke of Sutherland at Blurton, whilst the remainder of bricks were made at the works of Messrs. Hewitt, of Fen who generously made a gift of 20,000 bricks. The heigh the tower from the level of the ground to the top of the par is 98 feet, and on plan it is 24 feet square in external dim sions. The parapet of the turret is 6 feet 9 inches above general parapet. The height is divided into three stages, a ground-floor, which forms a main entrance into the churc clock-room and the belfry floor, but there is an interme floor between the entrance and the clock floor designed fo ringing loft, which is open to the lower arch between the n and tower, and therefore visible from the interior of the chu By this arrangement the office of the bellringer is duly ackn

TO ARCHITECTS, SURVEYORS, &

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

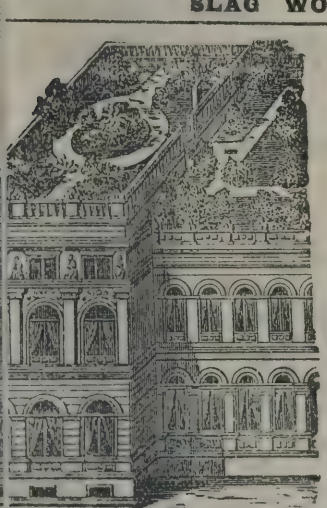
CHING'S Patent Mica Valve Chimney Breast Ventilator, or
CHING'S New Patent Silent Chimney Breast Ventilator

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

d and his operations are apparent, and it is seen whence the l of the bells originates. Happily the bellringer of to-day knowledged as a church-worker, and there is no reason he should be hidden in a remote chamber, which in former served conveniently enough as a cloak to customs not continued. In consequence of this provision of the ring- oft, the west front appears to be of four stages, in the d of which has been placed the window which, before the lding of the church, was at the east end of the chancel, and was temporarily removed to the west end of the church. e is a stair turret leading from the entrance floor to the top of oof at the north-west angle of the tower, giving access to the floors. In the west front a double entrance is provided, ng into the tower, which at this stage is furnished with le screens and swing doors. The style of the architecture at adopted in the body of the church, and known as rated, but it is treated in the simplest manner, the only hment being in the tympanum over the double doorway, contains a sculpture. The design selected is a large of Christ as the Good Shepherd, and the work has been sted to Mr. Robert Bridgeman, who has been extensively oyed in the restoration of Lichfield Cathedral. The ings to the doors and windows, &c., are of stone and cotta. Messrs. Lynam, Beckett & Lynam are the archi- and Mr. Mould the contractor. The cost has been about l. The bells—provision is made for a peal of eight— been cast and hung by Messrs. Carr, of Smethwick, who, ason of a local connection with the parish, gave the prin- bell.

WHITSUNTIDE ON THE CONTINENT.—Cheap tickets avail- for eight days will be issued to Brussels, May 18 to 20 ive and May 22 *viâ* Harwich and Antwerp. Passengers ng London in the evening reach Brussels next morning, a comfortable night's rest on board the steamer. For ng The Hague, Amsterdam, Utrecht and other parts of nd, the Rhine, North and South Germany, and Bale for erland, special facilities are offered *viâ* the Great rn Railway Company's Royal mail Harwich-Hook of nd route, through carriages being run to Amsterdam and , Cologne and Bale. Restaurant cars are run on the and South German express trains. The General Steam ation Company's fast passenger steamers will leave ch on May 17 and 20, for Hamburg, returning May 21 4.

ELECTRIC NOTES.



FOR some time the Elland (Yorks) District Council have been considering ways and means of lighting the town with electricity. The Clerk to the District Council has received a letter from the English Industrials, Limited, Manchester, asking whether the Council were open to deal with the question of erecting an electric station for light, power, and eventually tramways purposes for their district. General opinion seems to be against allowing a company to have the monopoly.

GERMANY is at present making rapid strides in the construction of electric street railways, and in the smaller cities a number of such railways are either in progress of construction or are being planned. In Meissen, Weimar and Eisleben the roads are being built. The following cities, according to Consul Harris, of Eibenstock, are planning the immediate construction of electric plants and electric street railroads :— Pforzheim, Trier, Ratisbon, Colmar, Jena, Kaiserslautern and Worms. There are no doubt other cities that are preparing to do the same thing. The population of those above mentioned varies from 15,000 to 50,000.

THE electric-lighting committee of the Perth Police Commission met Mr. Hawtayne and discussed the merits of various sites for the erection of the generating stations for the supply of electricity. Mr. Hawtayne gave the meeting a general idea of the works he proposed to construct, and replied to a number of questions put by members. He suggested that a larger plant than that mentioned in his report should be erected, which would cost some 3,000*l.* more. The meeting then, with Mr. Hawtayne, visited the site near the smallpox hospital on the shore, and also the site near the gasometer at the Upper Harbour. Mr. Hawtayne having stated that the site at the smallpox hospital was much to be preferred, the committee agreed to recommend the Commissioners to adopt that site, and Mr. Hawtayne was instructed to prepare plans and specifications for the execution of the necessary works, making provision for the larger plant which he suggested should be erected, for the consideration of the Commissioners. At the monthly meeting of the Police Commission recently, Lord Provost Dewar presiding, Bailie Wright moved, and Councillor Reid seconded, the adoption of the minutes, and this was unanimously agreed to.

THE Great Eastern Railway Company have erected in their station at Liverpool Street an electric clock, which is said to

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing ; Samples, Prices, &c. re Sheet Asphalte, free.

. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered. Price 12*s.* 6*d.* Office · Imperial Buildings Ludgate Circus, E.C.

be the largest in the world. The case, with its towers and finials and its columns with carved capitals boldly decorated, weighs between two and three tons; it is entirely of iron and manganese steel, and the clock case is practically an apartment 9 feet square. The four open dials are each 6 feet in diameter, the figures of the hours are about 18 inches apart and of the minutes 3½ inches. This grand clock is in sympathy with several others working in the same electrical circuit, authoritatively giving them the time of day, and doing the business with absolutely accurate unison. In an office adjoining the main telegraph office is a London regulation clock so adjusted that the timekeeping does not vary more than two seconds per week, and for weeks together it has indicated correct Greenwich time to a second. An electrical contact is fixed to the movements of this clock, and every fifteen seconds it transmits an electrical current that moves the hands of all the clocks in unison. Of course this electric control principle in horological work is no novelty.

THE inauguration of Bootle's new system of electric lighting and power supply took place amid considerable pomp and ceremony on the 20th ult., and the municipality may well be proud of the excellent completeness of the equipment. The building is situated in Pim Grove, and the electric system adopted is that known as the three-wire continuous current system, the current being supplied to consumers' lamps at a pressure of 220 volts. The plant in the station consists of three Lancashire type boilers, each 7 feet 6 inches diameter by 28 feet long, with supply steam of three quick-revolution steam engines, two of 125 indicated horse-power and one of 250 indicated horse-power, coupled direct to two dynamos of 150 kilowatt capacity. For economical working each engine is fitted with a Korting ejector condenser, the condensing water being pumped from the canal and delivered into a condensing water-tank on the roof of the pump-house by means of motor-driven centrifugal pumps. Switchboard arrangements are made for coupling up four dynamos, and also for feeding into the distributing network of four points, and all necessary instruments and apparatus are provided for the efficient and economical working of the station. For utilising as far as possible the waste heat from the boilers a Green's economiser, consisting of 192 tubes, has been placed in the main flue, and through these pipes the water for feeding the boilers is pumped, the temperature of the water being thus considerably raised. Under the pump-room, between the engine-room and the canal, a brick feed-tank is provided. All steam and exhaust pipes are drained and tapped. Connec for steam supply to the feed-pumps are arranged for on sides of the main range of steam pipes. In the engine-r travelling crane is provided suitable for lifting 8 tons. present capacity of the plant is 300 kilowatts, which is ca of dealing with about 8,000 lamps of 8 candle-power conn to the mains. The mains are paper insulated lead-co cables, fixed in earthenware troughs, and then run in solic refined bitumen. For the public lighting of the bo 72 10-ampere arc-lamps run four in series are vided, each lamp-post being fitted with two bra for incandescent lamps, arranged so that at mid the arc-lamps may be put out and the incande lamps switched in. The lamps are spaced about 60 apart. The system of charging adopted by the lighting mittee is that known as the "Wright" system. It has decided at Bootle that in the first instance 7*d.* per unit fo first hour at maximum demand be charged, and that all e used in excess of this amount be charged for at the rate per unit. Under this system the greater the number of per day the light is used, the cheaper it becomes to the sumer—thus, for an average use of two hours per day the is 5*d.* per unit, for three hours per day 4½*d.* per unit, four per day 4*d.* per unit, and so on. The Bootle scheme has designed and the carrying out of the works superintende Mr. Thos. L. Miller, M.Inst.C.E., Tower Buildings, Liver the consulting engineer to the Corporation, Mr. O. F. Fra Assoc.Inst.E.E., acting as his clerk of works; the build being from the plans prepared by the borough engineer, J. A. Crowther, Assoc.M.Inst.C.E. At the present time municipal works supply over 2,000 incandescent lamps 52 arc-lamps in the borough.

ACCORDING to an article in the "Centralblatt der verwaltung," overhead wires are universally employed for tr way traction in Germany, only one or two short stretch line in Berlin being supplied with current by subterran conductors. The overhead wire causes great dissatisfac Consequently American experience with the underground duit is being closely watched. The accumulator is admitt unsuccessful. Only one line, the former Eaglewood lin Chicago, is now worked by accumulators. According to "Centralblatt" there are now 230 kilometres of subterran conduit in the United States, and nearly all the companie New York are adopting the system.

THE BUILDING TRADES EXHIBITION.

[CONCLUDING NOTICE.]

E. Hotwill.

E. HOLWILL, of Temple Chambers, E.C., had an actively arranged stand, in which he showed some fine imens of architectural and other terra-cotta from the kilns e North Devon Clay Company. Conspicuous among these an excellently modelled lion of almost life size, represented pose of dignified vigilance, a portion of an enriched ice, panels, brackets, name-tablets, string-courses, &c. On same stand the Marland Brick Company was well repre- ed by specimens of their impervious faced (strain-resisting) ed bricks, as specially made for the Blackwall Tunnel. se bricks, which are of good creamy colour, are very dense hard, are non-absorbent, have a smooth washable surface, are good light reflectors. There were also specimens of same company's damp and air-proof engineering bricks, as as a variety of glazed bricks of all kinds, fire-bricks, &c.

Bath Cabinetmakers' Company, Limited.

This company make a specialty of inlaid wood panels, of h they showed a variety of specimens, all of which were acterised by excellence of design and finish. We were icularly struck by a door panel of Renaissance design, in h a number of woods were employed with charming effects; y others were shown, the patterns rising from the simplest e most elaborate, but all bearing the same high quality of manship and finish. The company also turn out effective l-work in repoussé copper, &c. Included in the exhibit several mantelpieces in various woods, more or less orately carved. One of these, of Renaissance design in was especially effective, and another in mahogany with l panels, as above mentioned, attracted a good deal of urable attention, as did a massive oak door with quaint er ornamentation.

Patent Indurated Stone Company, Limited.

The Patent Indurated Stone Company, whose paving has largely used by the Poplar, Whitechapel and Lewisham ds of Works, the Walthamstow, Tottenham and Dartford rict Councils, the Hackney Vestry, the Southend-on-Sea oration, the Brentford, Barnes, Barnet and Ilford Councils, Colchester Corporation, and Wanstead, West Ham and ford School Boards, &c., made an attractive show of their at stone in the various forms in which it can be utilised as slabs for street and stable paving, steps and stairs, concrete manholes, sanitary tubes, architectural dressings in different colours, &c. The centre of the stand was occupied by a handsome *in situ* staircase, with balustrades, &c., of graceful and substantial appearance.

The paving, originally introduced in 1885, has gradually gained in reputation, owing to its durability, economy, freedom from slipperiness and cheapness in first cost. So satisfied is the company of its durability that they have given, and always give with each lot laid down, a guarantee to replace the same, if defective, allowing for fair wear and tear, for a period of ten years. In no case, we are informed, has any application to have defective paving restored been made. This in itself is sufficient to show the superior quality of the paving. This result can only be attained by using the best materials, manipulated with the greatest skill. The materials consist of the best crushed granite from Leicester. This is washed by machinery, to ensure the best results, and afterwards intimately consolidated with the cement in steel-lined moulds. They are afterwards hardened by special chemical processes and put into stacks to mature, which is ordinarily accomplished in six to nine months' time, but if necessary the company can lay down slabs five years old.

John Doughty.

In our notice of the electrical section we omitted to mention the exhibit of Mr. J. M. Doughty, who showed many extremely beautiful designs for electric fittings. These were of such uniform excellence that it is difficult to select any of them for individual description. We may, however, mention a few of the more important pieces; prominent among these was a beautifully executed basket of flowers, the basket itself being in woven copper and the flowers it contained having beaten leaves—the blossoms themselves being, of course, the lamps. A quaint conceit was worked out in antique swords enwreathed in hammered bay-leaves interspersed with lights, a design which would prove very effective for a cornice decoration. Some handsome two-light brackets were shown as designed for the Kaiser's yacht. Another very effective piece was a seven-light ceiling centre in brass and copper, with electro-plated reflectors. Elegant floor and table lamps, and elaborate silk shades—a specialty of the firm—were also here to claim attention. It is not too much to say that the various fittings shown by this firm were in every case distinguished for novelty and elegance of design and beauty of finish.

LARGEST MANUFACTURERS OF WOOD CHIMNEY-PIECES IN THE KINGDOM.
ESTABLISHED OVER 20 YEARS.

Cluse, Limited.

Messrs. Cluse, Limited, had a very attractive and well-arranged stand, on which they exhibited a very large variety of excellent designs in art brasswork, cabinet and builder's brass-foundry, as lock furniture, finger-plates, sash-fasteners, bell-fittings, &c. What, however, especially appealed to us was some fine work in malleable iron of antique design, well and artistically carried out.

S. Clark & Co.

In the Smoke Abatement section, Messrs. Clark & Co. showed an excellent selection of their patent hygienic "Syhon" gas stoves, suitable for halls, rooms, public-house bars, &c. Amongst them were some very attractive designs in majolica. Gas boiling and cooking stoves were also shown, as well as heating stoves for oil, &c.

Graham & Biddle.

This firm showed some good mantelpieces and grates. The latter, which were of the "dog" variety, contained a gas fire of simulated logs in asbestos, which produced a very attractive and cosy effect.

British Compo-board Company.

Compo-board, specimens of which with examples of some of the uses to which it can be applied, were exhibited in bay 7. It is a combination of wood and paper so arranged with relation to each other, and united by a strong, adhesive, fireproof cementing material, that the result of the union (as an independent constructive material, for which it is claimed that it has all the advantages of both) is subject to none of the objections which may be urged against them, and possesses many qualities not found in either of them or any other known material, all of which serve to fit it for use for a large number of purposes where nothing else will answer satisfactorily. The surfaces of the board are heavy, damp-proof paper boards. These are made from finely ground pulp, chemically treated to make the finished board resistant to moisture. They are thoroughly dried and highly calendered. The wooden core is made up of thin narrow slats of uniform thickness, with smoothly sawn faces and straight edges cut from bone dry wood. These slats are cemented together edge to edge and to the inner surfaces of the heavy paper board faces by the cementing material, which, plastic when applied, sets immediately under pressure into a hard stone-like substance completely filling all openings of every kind in and between the slats, firmly uniting them to each other and to the faces, giving the board great rigidity.

Fenlon & Son.

Messrs. Fenlon & Son showed examples of their patent hot-water apparatus, to burn gas or oil, for conservatories, & patent hot-water circulating condensing stoves, to burn gas or oil, fitted with cast-iron radiators; circulating hot-air and hot-water condensing stoves, with propagators combined; patent self-acting washing machines, &c.

W. G. & L. England.

The patent reversible and sliding sash windows shown by Messrs. England are remarkably simple and effective. They dispense with the use of weights, as each sash acts as a counterpoise to the other, they afford an excellent means of ventilation, and are exceptionally easy of manipulation for cleaning and repairing from the inside, as they can be taken off the sliding stays and replaced in a very short time, and it is not necessary to remove any of the beads or disturb the woodwork usually shown in the ordinary sash window; in this way the expense attending the repairing and painting of windows in buildings of great elevation are materially reduced.

Among other firms whose exhibits we are unable to notice at length owing to lack of space are the following:—

H. Hart, drain and chimney cleansing machines; H. Webb, reversible windows; W. Parkinson & Co., cookers, grates, &c.; Rigby, Battcock & Co., paint brushes; A. Cooper, suction and vacuum pumps, &c.; H. Blacknell, post boxes, seed trays, &c.; Howard Bros., Emdeca Metal Decoration Company, Hall & Boordman, Limited, Julius Hulse, H. J & C. Major, Matthews & Yates, Limited, J. Syer & C., Archibald Ansell, Easily Cleaned Window Company, Towers & Willlamson, William Jones & Sons, W. Barnsley Hughes, Hooper & Co., W. Seacombe & Co., J. C. Fawcett, Limited, Cyanite Paint Company, Bilbie, Hobson & Co., Sidney Buth, A. H. Bayley, H. E. Kershaw, W. & C. Johnson, C. J. Eppens, H. Alexander & Co., R. W. Taylor & Co., J. Stone & Co, R. Becker & Co., A. B. Miller & Co., Southwark Manufacturing Company, Wilson & Co., Blackstone & Co., Limited, National Gas-Engine Company, Limited, Horsham Engineering Works, Nuneaton Engineering Company, Lawrance Seager, J. Office: Imperial Buildings, Ludgate Circus,

ST. MARY'S HOSPITAL, MANCHESTER.

IE new St. Mary's Hospital, now in course of erection in :ford Street and Gloucester Street, will be an ambitious dition to the public buildings of the city. The designs are Messrs. Alfred Waterhouse & Son, of London.

The main front of the hospital, 280 feet in length, which is)ken into by a deep courtyard, takes a full south aspect along oucester Street. The Oxford Street frontage is considerably :tricted, being only some 25 feet in length. The block which mes up to Oxford Street will provide an entrance for the out-tients, for whom accommodation will be arranged upon the ound floor in a series of waiting-rooms and examination-)ms placed in convenient proximity to the dispensary. The neral entrance to the hospital will be in the centre of the ith courtyard. A special feature of the plans is that the :ommodation (which is for women and children) is divided roughout the building into two portions; each portion is tinct, and will be furnished with separate entrances, stair-es and lifts. On the west of the entrance the maternity es will be housed, while the wards on the right will be set art for the diseases of women and children. On the ground or, which will be largely occupied by the out-patients' rooms, e lecture theatre, the chapel, the mortuary, the museum and e residential rooms, this distinction will not be so apparent upon the upper storeys, but there will be separate entrances the two classes of patients as well as for the general public d for tradespeople. In close proximity to each entrance for ients there will be a passenger lift capable of conveying a umbent patient to any floor.

The hospital proper may be said, as far as wards are con-ned, to commence upon the first floor, although the circular ilion, which is one of the principal features of the elevation, l not be made use of for ward purposes at this level. On the r above, where the circular apartment is not cut up by walls, re will be accommodation in this portion for twelve beds, in erfectly circular room, with a diameter of 43 feet. This m will be surrounded on all sides by windows, interrupted y by the small wall spaces taken up in the entrance and in bridgeway to the sanitary tower. The second-floor circular d will form the principal maternity ward. There will be ther precisely similar above it upon the third floor, but on first floor the space will be apportioned for dormitories for ses and for women who are being trained as monthly nurses. the east side of the hospital, set apart for diseases of women, there will be on the first floor a large rectangular ward for twelve beds and three or four separate wards for one or more beds. On the same floor will be the board-room, near the grand staircase, and the library, which will occupy the Oxford Street corner of the site over the out-patients' entrance. This library will extend to the second floor, from the rest of which it will be separated by an air passage, which will admit of the free circulation of air into the south-east court, and thence between the bridges of the isolation wards into the north-east court. The second floor generally will be fully occupied by wards and by the necessary administrative rooms in connection therewith, and the same may be said of the third floor, which will be nearly a repetition of it, the library buildings being roofed in at this point and having no further accommodation above them. The fourth floor will be largely occupied by servants' rooms, and will also contain the kitchen, scullery, bakery, larders and stores.

The most conspicuous features of the elevation are the large circular ward block of the maternity department, the octagonal tower of the Oxford Street front, and the sanitary turrets attached to the circular ward and to the rectangular ward. With regard to material, the exterior will be simple in character and rely for its effect more upon the general outline, which is the outcome of the requirements, than upon elaboration of detail. The main walls are to be faced with hard Accrington red bricks, relieved by a moderate use of terra-cotta made by Messrs. Gibbs & Canning, of Tamworth, and by moulded strings and cornices. The new hospital will be fitted for 125 patients, the larger portion being reserved for diseases of women; further accommodation will be provided inside the buildings for the training of medical students, nurses, midwives and monthly nurses. The contractor is Mr. Vickers, of Nottingham.

PROFESSIONAL CHARGES.*

THE practice of architecture in most countries is governed by "codes of ethics" of professional societies representing recognised professional authority. A schedule of professional charges is usually included, besides rules governing the mutual relations of architect, owner and contractor. The schedules of

charges generally recognise a charge of 5 per cent. on the cost of execution as either an average or a minimum, and may therefore be properly referred to as the "5 per cent. rule."

Historically, I believe, the idea of a percentage charge for architects' services originated in France, where 5 per cent. on the cost seems to have become customary for public buildings some time during the eighteenth century, receiving official sanction during the French Revolution. Up to that time architects received either stated sums or salaries. Whether originally intended as an average for public buildings or a general principle, the rule gradually received general recognition in most countries, and may originally have been a help to the architectural profession in its early struggles.

However, conditions soon changed. New types of buildings necessitated the study of new requirements, demanding added work and training; every known wood, stone, metal, &c, on the globe was thrown upon our markets, added new problems, new studies, new responsibilities; new devices innumerable, new systems of construction, new materials and inventions to render everything from cellar to roof water, fire, damp and bug-proof, convenient and beautiful, turned the old style routine and constructions topsy turvy, and threw upon the architect the solution of problems sufficiently numerous to call for an additional profession. In addition to this the element of speed in construction, the contract system implying the duty of anticipating all contingencies to occur during the entire period of construction, and business growing out of building laws and underwriters' requirements, have in the aggregate added enormously to the architect's work and responsibility, demanding at the same time a more comprehensive professional training and wider experience. The "5 per cent. rule," however, remained unchanged, demonstrating its utter lack of elasticity and adaptability.

The lesson is obviously that a percentage rule is liable to become firmly fixed in the public mind, thus preventing the recognition of the nature and magnitude of services rendered as well as values actually created or benefits conferred by such services. Nor is this lesson a new one, the injustice of percentage rules having frequently been pointed out, for instance, by George Edmund Street, who is said to have denounced it as the greatest of absurdities.

The idea, then, naturally suggests itself to investigate the principles underlying these rules and their working results As a principle the valuing of architects' work as a percentage on the cost of executing designs appears perilously like valuing a sculptor's work as a percentage on the cost of casting Whether architecture is considered as art, invention or skill and expert service, its value is not, as a matter of fa dependent upon the cost of execution or bearing a fixed pr portion to it. The value of art, skill or invention, on t contrary, is measured by the market values created by the and regulated by the law of supply and demand. Howev percentage rules ignore this natural process of establishing t value of architects' work, rendering actual tests impossible.

Incidentally, percentage rules make it profitable for arc tects to increase the cost of buildings, and those accomplishi much with small means are thus mulcted for their pains. P centage rules, furthermore, embody the purest form of labo union principles, ignoring differences in talent, training, expe ence, standing and skill, in fact ignoring the element of tin thus rewarding incompetence, neglect and inefficiency at t expense of good training, experience, skill and painstaki care, the professional charge being the same no matter whom rendered or how carefully or carelessly performed. is, then, fair to conclude that the principle of percentage ru is false—1, in assuming the value of architects' work to dependent upon the cost of execution, and 2, in ignoring diffi ences of talent, skill and experience and actual amount services as rendered.

Equally apparent are the following results:—(1) T antagonising of natural laws governing the recognition of t nature and value of architects' services, and (2) robbing tale skill, experience and success of the increased remunerati which is naturally theirs, thus encouraging the doing of mu in preference to doing it well, no other reward being open the successful practitioner.

Under the operation of the rule in America, by increasi duties and responsibilities and stationary charges, a level h been reached generally prohibitive of the employ of expe assistance except at the expense of the legitimate profit architects, few owners being willing to pay for it. Indirectly, th very fact is the main cause of the absence of specialties in t practice of architecture. The difficulty of obtaining appropri tions even for clerks of the works and the most necessa expert engineering assistance clearly proves that any sugge tion of needed expert co-operation from other architects wou be taken by clients as implying self-confessed incompetenc while lawyers and physicians, in the face of much keen rivalry inside of their far more crowded professions, as con pared with the architectural profession, find no difficulty in th

ction. The employment of specialists is, however, purely he interest of the public and economy of efforts.

The relations of professional men to their clients are, as a , dictated largely by personal considerations, and should, he interest of all, be as permanent as possible. Every nge implies additional and unnecessary effort and trouble oth sides. On the other hand, no barrier should exist to itects engaging such associate architects or generally ring such expert assistance as may appear best to the rests of their clients.

It is obvious that the talent, inclination and experience of erent architects will run in different directions, and it is hing short of a public calamity that the present system uld force so many able practitioners in doing what they are, inclination, training and experience, entirely unfitted for. establishing of specialties would, moreover, mean opportunities for establishing reputations in the different branches of e particularly artistic, constructional or executive work, indirectly effect a great strengthening of the architectural fession by making professional records valuable.

It may not be amiss, in this connection, to mention that, ually, the schedule in the United States is 5 per cent. and England 7½ per cent., with the only difference that English itects furnish bills of quantities, which additional work is formed by quantity surveyors, as independent firms or chés of architects' offices, and at a cost seldom exceeding r cent. on the cost. The English system is certainly better more business-like than ours. The builder, basing his posal on the bill of quantities furnished, and assuming no onsibility for it, the competition is fairer, and occasions for pts as to the interpretation of drawings and specifications ced to a minimum. Percentage rules, however, are open he same objections in all countries, although it may be rved that the injustice worked is less serious in most pean countries, where the old systems of construction the old routine of professional practice still prevail.

The remedy most earnestly needed is a careful understanding between architect and owner as to the amount and of services to be rendered. Even a recognition of the consumed in the work would be a distinct gain. The full ion of the question of value of architects' work must ft to work itself out naturally, the present barriers to this ess to be withdrawn. Generally speaking, it is limited to minimum by the amount of what is commonly called penses," below which architects are working at a loss, and as to its maximum by its market value, both being subject to variation. The actual value of architects' work is ascertained, practically, in various ways by comparing results.

The following test is a suggestive example :—The present professional charge for preliminary work and sketches, general plans and specifications, building and health department work, estimates and work connected with them is 2½ per cent. on the cost of the work. The difference between the highest and lowest proposals will average at least 15 per cent. This, of course, is not a measure of the value of plans and specifications, although the magnitude of the fluctuation is suggestive.

However, it is evident that the technical skill, knowledge of the building market and painstaking care employed in devising the labour saving constructional organisation contained in the general plans and specifications, which constitute the necessary basis for the builder's organisation, is worth the difference between this organised handling of the work and the handling of similar work without such organisation, without regard to the quality established by specification and supervision, art value or value of invention or planning involved, and the fluctuations even of estimate on such data prove that the proper managing of this financial question alone more than repays the owner the entire architect's commission. Thus, what is commonly supposed to be the architect's main or only work is really not paid for at all.

Other tangible elements of market value are appearance and durability of construction, saleable qualities, rentability, convenience, &c. The value of architecture, from a general point of view, may be analysed similarly to that of the other sorts. Architecture is not a mixture of art and engineering, as is often said, but includes in its very nature a technique (defined as the practical details of a fine art) like all other sorts. The technique is the incarnation of art; without it architecture would not exist in stone, wood and metal, &c., right in our midst, but in the clouds with some architectural writers. Did not Michel Angelo spend much time at Carrara doing a vast amount of quarrying until he found the proper material and building bridges, thus giving months of the allotted time of his genius to the technique of his art? The technique is a necessary part of every art, and, in a certain sense, what the body is to the mind. If the art element proper is often overbalanced by the problems presented by the technique, this, of course, affects the nature of the architect's work and the proper estimate of its value.

As an illustration of this point, buildings might be con-

sidered under two heads, namely:—1. As "plants" erected for a definite utilitarian purpose, the technique overbalancing the element of art proper. 2. As monuments erected mainly for artistic or monumental purposes. In either case the value of the architect's work is decided by its measure of success, usually expressed in the form of market value. The existence of this value is proven by successful buildings and the history of museums, collections and heirlooms all over the world. However, values measurable by the standard of high art cannot be made out of bare walls, sheet metal, or even without sacrificing such space as is necessary to develop it.

We may, for instance, properly conceive a church as a "plant" for worship or as a monumental church. To attempt monumentality where actual conditions require the problem to be treated in the spirit of a "plant" is humbug, and the result is foreordained to bear the stamp of the shabbiness of false pretensions. At the same time, such conditions may exist, indeed do exist in most cases, as to truthfully demand a solution partly "plant," partly "monument," being one of the modern "practical" tendencies which have caused so much foolish comment.

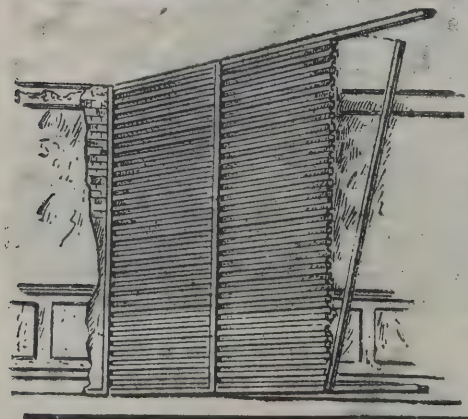
In order to bring the proper order out of the present chaos of this large and varied field the questions involved should be studied by experts like in sculpture and painting, in which values are undoubtedly, directly or indirectly, established by expert purchases.

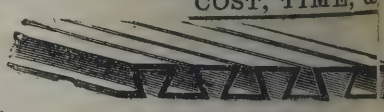
The enormous values involved in architecture demands this as a public necessity. Every penny invested in architecture and its auxiliary arts, and which is not required for the necessities of support and shelter is art, and can have no value except as such. If its design is such as to preclude art value its cost represents a waste pure and simple, except in so far as it may be justified to a slight extent by existing notions as serving a certain wear. A "practical" grasp at these facts is just what we need.

Monumental work, naturally, is mainly educational, although fame, the attraction of travel, enhancing of values of adjacent property, &c., are elements of tangible value. On the other hand, it can only become of value through its design. If monuments possess value at all it is primarily due to their designs.

In properties for sale or to let, especially where intricate planning is required, the value of good and *vice versa*, the depreciation due to poor designs are often very great, as many apartment houses and blocks after blocks of poorly designed "ready-made" residences have testified. Rent values i sales values often show tremendous losses after a few ye occupancy without being accounted for by other circumstan A new house will, as a rule, sell to an indiscriminating pul but it takes a well-designed and well-executed house to hol value and even increase it. Still more dependent upon t designs are residential properties both in city and country.

Of course there are other factors affecting property val however, apart from these, the value of residences can onl preserved through the excellence of their designs. It is shoddy work was so long the rule in American residences many accepted the rule that a residence was simply built the wear of one generation or such parts of its existence as left at the time of building. However, the unanimous testim of history is to the effect that the good work of all times appreciated, and that excellent design with excellent execu mean a good investment. Mediocre design and medi execution mean bad investment, in fact, often total loss aft short use. What I have here briefly referred to I am s architects will find no difficulties in exemplifying from t own experience.





The question of "fashions," as opposed to permanent investment value in architecture can only be referred to a few words. The excellent work of all periods is now rec nised as a matter of fact, and the trend of civilisation be away from narrow prejudices and toward greater liberal broader views and increased individuality, we have a right to expect that this recognition will be permanent.

Manufacturers and salesmen naturally seek to creat market for their "latest," but real architecture is beyond power of this influence, moving with the general currents f human thought, which may be called fashions in a wider ser but constitute in our times no danger to permanent art val In addition to this the value of design in the manufactures absolutely dependent upon the state of architecture.

It is likely that our present percentage rules have blind us to the magnitude of the question of value of architectu However, even a superficial tracing of it into its main ramifi tions speedily reveals the fact that large enough values involved to render the question one of absorbing interest a importance.

As to the practical application of the above, it is for architectural societies to decide what their future policy sh be. It is unlikely, however, that any attempt on their part regulate architects' charges will in the long run be successfu

CRAVEN HOUSE—OLD AND NEW.

E London County Council, although a body of compara-ely recent formation, has already by its vigorous policy of ening up congested districts and widening narrow thorough-es amply justified its existence. Under its auspices London s fair to become one of the cleanest and most healthy es in the world, as indeed it should, being the centre from ich the highest principles of sanitation have been and are ng disseminated, and the capital of the nation which has en to the world its greatest engineers. One of the most king and important examples of the Council's beneficent on in the direction of "opening up" is to be found in the ghbourhood of Clare Market, a district which has long been orious for its squalid alleys and insanitary surroundings.

Old Craven House.

The New Building.

T: rookeries and slums which have so long existed in this -time aristocratic locality are now being rapidly demolished, in their place wider streets and substantial buildings are earing, buildings devoted principally to commercial and ustrial enterprises. Probably not many Londoners are re of the fact that a few centuries ago the Earls of Craven their family mansion, Craven House, upon the site which ow bounded by the lower end of Drury Lane on the west, re Market on the north and east, and Wych Street on the th. This edifice, which is depicted in an engraving by nson, published in 1800, has long been demolished, and its has been since occupied by a number of smaller buildings used variously as tenements, workshops and warehouses. After many changes the various buildings were eventually acquired by a firm of manufacturing sanitary engineers, who, true to the instincts of their profession, were not content to merely remedy existing defects in the condition of the property, but, having entered into an agreement with the authorities by which a portion of the site was devoted to the much-needed widening of Drury Lane, they have now erected an elaborate terra-cotta building containing extensive and well-lighted showroom, office and warehouse floors, and having its main entrance at the end nearest the Strand—a turret surmounted by a dome and flagstaff. This building has been appropriately named Craven House, thus perpetuating the memory of the historical associations of the site.

NEW SCHOOLS AT NOTTINGHAM.

The Mundella Higher Grade School and School of Science, in the Meadows, Nottingham, were opened on the 29th ult. The contract for the erection of the schools and outbuildings was entrusted to Mr. Enoch Hind, and the work was superintended by the architect, Mr. R. C. Clarke, and the clerk of the works, Mr. W. H. Price. The larger school is in two separate blocks, divided into the higher grade and science department and the laundry, gymnasium and dining-rooms. In these accommodation is provided for 402 girls and 502 boys, whilst in the neighbouring building 230 infants will be accommodated. The front of the graded school, which is in Mundella Road, is of brick, with yellow terra-cotta dressings. On the ground floor is situate the girls' school; on the first floor is the boys' school, and the laboratories, lecture-room and drawing-classroom occupy the second floor, where also are the chemical laboratory, which is 51 feet 3 inches by 19 feet 6 inches, the drawing classroom 31 feet by 27 feet 6 inches, and the lecture-room 31 feet by 27 feet 6 inches, fitted with gallery, desks, &c. Entrance to the girls' school has been established on Mundella Road, the managers' entrance being also at this point. The boys and infants will enter their schools from the Collygate Road. Careful attention has been paid to the important points of lighting, heating and ventilation, and the cloakrooms are neatly and conveniently arranged. There is also on the ground floor a girls' assembly hall, which is 64 feet by 30 feet 6 inches, and is approached from two entrances, and on the same floor is the cookery-room, with adjacent scullery and cloakroom. On the south side of the graded school, in a separate building, are the gymnasium, the laundry and separate dining-rooms for girls and boys, provided with cooking ranges, so that scholars from a distance may obtain their meals in comfort at school. The gymnasium is 44 feet by 22 feet, and is completely fitted with apparatus for the physical development of scholars. The infants' school in Collygate Road, on the north side of the graded school, has a central hall 48 feet by 27 feet, and has two entrances. Three infants' classrooms and one "babies'-room" have been provided. The interior of the buildings presents a clean appearance, all the walls up to 4 feet high being faced with white-glazed bricks. The drainage work has been carried out on the latest sanitary principles, and the whole of the heating has been entrusted to Messrs. T. Danks & Co., of Nottingham. The contract for the schools and outbuildings, exclusive of fittings, amounted to 17,146*l*.

Fosdyke County Bridge, in the Holland Division of Lincolnshire, has been closed for repairs, having become unsafe.

KENSINGTON TOWN HALL EXTENSION.

THE new extension of the building designed by the late Robert Walker has been erected in accordance with plans and designs prepared by Mr. Wm. Weaver, the surveyor to the vestry, and Mr. W. G. Hunt, who were appointed by the vestry to act as joint architects.

The new building is connected with the Town Hall proper by a covered way, which has had to be restricted in height in accordance with the terms of an agreement between the vestry and the managers of the National schools, and owing to the retired situation of the new building, with its frontages abutting almost wholly upon the churchyard, the exterior has been kept plain and is carried up entirely in stock brickwork with Portland stone dressings. The ground floor is occupied by additional offices for the medical officer of health and sanitary inspectors; members' room, to be also used by deputations in waiting, and the remainder of the ground floor is absorbed by the surveyor's department, comprising private office for surveyor, general office and drawing office.

There are two distinct and separate entrances from Church Walk, leading by separate staircases to the first floor, the front portion of which is occupied by a large committee-room, boldly treated in oak. The decoration of committee-room is deferred until the walls are perfectly dry, and it is proposed that the decorations shall be carried out in accordance with sketch exhibited in the room. For similar reasons the rest of the interior of the building has been treated on corresponding lines. In connection with the committee-room are lavatories, hat and cloak-room, &c. The northern portion of the first floor, entirely shut off from the preceding, is occupied by the coroner's court, witnesses' waiting-room and coroner's private room, which will also be used as a retiring-room by the jury. The court-room is fitted up in oak in a very complete manner, and is well lighted by side windows and a glazed dome.

The whole building is lighted by electricity and is warmed by hot-water coils in addition to the fireplaces provided. Over the front or south portion of the building a third storey is built, providing rooms for the accommodation of the hall-keeper.

The building has been erected by Messrs. Leslie & Co., Limited, Kensington Square.

MR. GEORGE MCGUIRE, town clerk of Bradford, died at midnight on Monday. Deceased was formerly town clerk of York.

PATENTS.

The Architect.

THE WEEK.

TRANGE case relating to the building of a church eard before the Irish Master of the Rolls on Monday. r years ago a lady in Dublin left about 8,000*l.* to the an Catholic archbishop of Dublin and one of his s for the erection of a new church. The former con- d the sum was insufficient, but the priest was ine, and believed that if the work were started any y required would be forthcoming. Two houses were ied as a site. The archbishop wished, for the sake of my, to preserve them, and to build the church in the out the priest was eager to have the frontage on the . The aid of the Courts was invoked in order to the two trustees of the will to agree. The priest ied plans, and managed to get a judge to approve of but the archbishop opposed taking out any part of noney. The priest's solicitor wrote to say that if ient were given a free hand he would undertake ild a church in accordance with the plans, and take upon himself the entire responsibility and the archbishop from any further trouble in connec- vith it. In the alternative, if the archbishop would t plans to the priest of which he could approve, he give his grace a free hand to carry out the building church. There is nothing sacred to a thief, and the contention was going on one of the houses was , the lead stripped from the roof, and the place was such a state as to become a nuisance to the neigh- ood. Both parties claim to be in the right, but as ill not agree the only course left is apparently for the of the Rolls to carry out the provisions of the will. rdship says he should like to see a handsome church p, but he is not a builder. As a compromise he d the removal of the house that has become ruined, is doubtful whether the housebreakers will succeed oring harmony between the ecclesiastics after judges wyers have failed.

E members of the National Society of Amalgamated orkers are as hard to please as if they were plasterers. eld a meeting in Birmingham on Tuesday, when it ported that the year's income had increased from *l.* to 16,989*l.* But in compensation for the prosperity iety had to meet demands of employers at Doncaster. the Society's point of view what was sought was ive, but impartial outsiders will, we are sure, have a t opinion on the subject. The following were the ls:—"Conditions as to the casting department:— at no meetings or discussions shall be held in p, except by express permission of the management; t no obstructions shall be placed in the way of bour-saving apparatus or improved methods; (3) e rule formulated by the men concerning the pro- of boys and men in the casting shops be abolished. ions as to the finishing departments:—(1) That the e of paying a bonus to society members only, to the n of non-society men, be entirely abolished; t we manage our shops in our own way, setting son we please to work any machine or machines." er words, the employers did not wish that they be controlled by the workmen employed by them. w system of production will not, however, tolerate ers who manage their business according to old- ed methods, and who do not recognise the advantages ending work to discuss politics. We suppose a ll shortly come when brass-working will be synony- ith talk.

---

affords a little solace to Frenchmen at the present e to think of the approaching centenary of HONORÉ ZAC. His memory should be interesting, especially architects, for no novelist was so careful about architectural backgrounds. If he had not taken to literature he must have obtained fame as a draughtsman or as an archæologist. BALZAC lived so long in Paris, it is difficult to believe he was not a native of the city. He arrived in 1819, and his first residence was in an attic of No. 9 Rue de Lesdiguières, in the Marais. There he began to write novels which he never cared to own. Literature did not promise him wealth, and in 1835 he tried to supplement it with printing. He tenanted premises on the other side of Paris, in a street now called after VISCONTI, the architect, and near the Ecole des Beaux-Arts. Afterwards DELACROIX used the printing office as a studio. As author and printer BALZAC was not more fortunate. We next hear of him in a boarding-house near the Observatory, JULES SANDEAU and GEORGE SAND being fellow-boarders. He grew tired of Paris and removed to Chaillot, and from thence emi- grated to Sèvres, where he became acquainted with COROT, the landscapist. BALZAC experienced the "earth-hunger," and somehow contrived to become a proprietor, but it did not long endure. The property had to be sold, and as he was left with his pen for sole property he must have been only a titular landlord. His next abode was No. 47 Rue Raynouard, Passy, which at that time was like a country village. His marriage with the Polish countess enabled BALZAC to believe that his dreams about a building he was to devise, and which was to be a romance in itself, were soon to be realised. A house was erected for him in the street of Passy which bears his name, but he was not destined to occupy it long, and from it he was removed to Père Lachaise. His remains are not to moulder there, for a place has been assigned to them in the Panthéon, and who can say whether hereafter another removal may not be inevitable?

THERE was a time when schoolboys who resembled MACAULAY'S model youth could recall the pursuivants' announcements of Lord MARMION'S titles—"They hail'd him Lord of Fontenaye, of Lutterward and Scrivelbays, of Tamworth tower and town." The MARMIONS have passed away but Tamworth Tower remains, and henceforth it will be the property of the Tamworth townsmen. It was a capital notion to acquire the old castle and grounds as a Jubilee memorial. The price would have shocked Lord MARMION. Castle and three acres cost only 3,000*l.*, so little value have historic remains in our time. The laying out of the grounds will add 1,000*l.* to the expense. It is proposed to convert three of the rooms into a picture gallery, and if paintings are not immediately forthcoming there is an immense collection of stuffed birds to serve as a substitute. Some of the rooms are interesting, and there is a large banqueting hall. Sir WALTER SCOTT tells us how "ROBERT DE MARMION, Lord of Fontenay, a distinguished follower of the Conqueror, obtained a grant of the castle and town of Tamworth, and also of the manor of Scrivelby, in Lincolnshire. One or both of these noble possessions was held by the honourable service of being the royal champion, as the ancestors of MARMION had formerly been to the Dukes of NORMANDY. But after the castle and demesne of Tamworth had passed through four successive barons from ROBERT, the family became extinct in the person of PHILIP DE MARMION, who died in 20th EDWARD I. without issue male. He was suc- ceeded in his castle of Tamworth by ALEXANDER DE FREVILLE, who married MAZERA, his grand-daughter. BALDWIN DE FREVILLE, ALEXANDER'S descendant, in the reign of RICHARD I., by the supposed tenure of his castle of Tamworth, claimed the office of royal champion, and to do the service appertaining; namely, on the day of corona- tion to ride completely armed upon a barbed horse into Westminster Hall, and there to challenge the combat against any who would gainsay the king's title. But this office was adjudged to Sir JOHN DYMOKE, to whom the manor of Scrivelby had descended by another of the co-heiresses of ROBERT DE MARMION; and it remains in that family, whose representative is Hereditary Champion of England at the present day." The greater part of the early castle no longer exists; the oldest work remaining is supposed to date from the period of HENRY VIII.

THE NEW PUBLIC BUILDINGS.

WE postponed the publication of the views and plans of the new buildings which the Government have undertaken until the whole scheme was completed. As Mr. WEBB and the officials of the Science and Art Department and Office of Works have decided upon what is required at the South Kensington Museum, there is no longer any reason for delay. Accordingly we publish this week drawings of the new museums of the Science and Art Department, the War Office and the offices in Parliament Street and Great George Street. On no former occasion was it possible for an English journal to present evidence of so bold an effort to deal with one of the most difficult problems in official organisation. Our plates are a testimony to the courage of the present Government in grappling with obstacles which daunted their predecessors.

It has been often said, and with reason, that the Government offices of this country were discreditable to the authorities. One of the causes which kept back improvements was the vast expense. It is only necessary to walk down Parliament Street and to recall its former condition in order to realise the extent of the property which had to be removed in order to obtain a part of the space which will be required for Mr. BRYDON'S building. If it is remembered that the houses which have vanished formed a hive of industry wherein wealth was easily acquired, the amount of compensation it was necessary to pay may be imagined. Engineers, parliamentary agents and a host of satellites were able to enrich themselves in Parliament Street, and eviction from so profitable a quarter signified the outlay in return of sums of money which the State alone could provide. With all their courage, the projectors of railway schemes avoided Parliament Street, Great George Street and the neighbouring thoroughfares. The District Railway was kept to a region which at the time of construction was no more than a slum.

Besides the expense, there was another reason. For many years we piqued ourselves on our unostentatious ways of ruling the greater part of the world. Foreign representatives used to be amazed at the simplicity of the buildings in which laws were made and laws were enforced, and the mean rooms in which peace and war were determined. HAJJI BABA could not believe his eyes when he saw the legislators of what he supposed was the whole world outside Persia quietly going through their duties while standing with their backs to the fireplace. India he found was swayed by "two swine-eating infidels, shaven, impure, walkers on foot, and who, by way of state, travel in dirty coaches filled with straw." He added, "This seemed to us a greater miracle in government than even that of BEG IAN, the plaiter of whips, who governed the Turcomans and the countries of Samarcand and Bokhara, leading a life more like a beggar than a potentate."

When the grand moguls of the East India Company went about in hackney coaches their subordinates were not likely to fare luxuriously. CHARLES LAMB says of one suite of offices in the old India House that they "were enough to enlarge a man's notions of himself," and consequently care was taken in most Government offices to preserve the clerks from dangerous temptations of that kind. The intention was wise, but it failed of its effect. The meaner the rooms the more the officials' conceit was enlarged, until circumlocutionism became a byword, and the Government service was supposed to be a refuge for those who were not endowed with much energy and industry. As a consequence, nobody cared about the places in which the civil servants were employed. Ordinary houses were bought or leased from time to time, and however inconvenient they might be for the transaction of ordinary business, they were assumed to be good enough for the men who were to use them. As time went on and the staffs had to be enlarged the offices became more unsuitable, but the general public as well as Parliament continued to be indifferent to the inconvenience which others besides the occupants were compelled to suffer.

About forty years ago it became necessary to have some change, unless administrative work was to come to an end. There was a competition, but the architects who took part in it were unable or failed to realise the uses of a Government office. SCOTT, for instance, apparently assumed the building was to accommodate grandees, and therefore certain impressiveness was to be imparted to the and to as large a part as possible of the interior. not realise that the offices were to be a factory production of documents, the registration of "m and a storehouse for red tape. Instead, therefollowing the example set by BARRY, who refronted S building, and in the central part of the elevation en five storeys with square-headed windows, SCOTT pu three storeys only and opened sixteen windows in a of wall where BARRY was able to open twenty-thr bigger and semicircular windows count, SCOTT'S ac exercise is superior to BARRY'S oblongs and squa even officialdom was not satisfied with the price whi to be paid to gain the victory. SCOTT himself was to admit that the rooms were unusually high, but the was, he said, that the beauty and magnificence of JONES'S Banqueting House were always thrown in hi and in self-defence he was compelled to adopt high like those which helped to produce the fine effect f building on the other side of the street. According present Sir JOHN TAYLOR'S evidence in 1877 b parliamentary committee, some of the rooms in the I and Colonial Offices are a great deal too large, while t are too high for official purposes, very much space and unnecessary expense was incurred. It was al that some of the offices were so lofty the clerks co hear themselves speak on account of the echo.

It will be observed that in the offices of the Government Board Mr. BRYDON, following the sugge of the Office of Works, in his arrangement comes nc BARRY than to SCOTT. He contrives to have four (including a mezzanine), as in the Treasury, instead three which are to be found in SCOTT'S elevation latter is the more imposing, but there is a sacrifi floor, which is a consideration to an economical G ment. However, the money expended is not altc wasted, for the Home Office from its treatment serv central object to which the offices of the Treasury and Government Board are pendants. Although his Office will be in juxtaposition with INIGO JONES'S bui Mr. YOUNG has not out of fear of comparison sac utility to height. He also has four storeys at lea some of the departments should complain of the as of distinguishing characteristics from the windows afford them light for the discharge of their public neither from the Government nor the public will sympathy be derived. Each floor is, in fact, dif treated in its fenestration, although there is more unity in general effect.

At Whitehall and Parliament Street the influe existing buildings could not be ignored. More libe able to be exercised at South Kensington. Wi Italian work of JONES and BARRY in presence, it wo considered indecorous to adopt the license wh tolerated in modern Free Classic. At South Ken the three buildings which will be said to adjoin t museum when it is finished, viz. the Natural Museum, the Imperial Institute and the Science Sc have little or nothing in common, or at any rate mu than is found in the Treasury Buildings and the Ban House at Whitehall. Mr. WEBB was therefore jus adopting forms which can only be distant relatives to be found in an Italian town. The museum ha it so many Italian works, a building that recalled P would not be inapposite. But as the Renaissance liberty, the exercise of that quality has likewise its priateness. The museum buildings suggest the imp of light by the area of window openings, and hence it be concluded that within rather than without the ta are to be found. The design would, in consequence likely to have gained HENRY COLE'S approval, altho great showman might have preferred a reproduc which a label could be affixed descriptive of the The building will declare its purpose, and that i The cupolas have also their use, but they were demde an assertion of the precedency which belongs to the and Albert Museum on account of being the repres of the ancient "boilers," which first revealed the tages of the district, and for other additional reason new works, as will be seen from the plan, will not te

the existing courts, and consequently, we suppose, the ding operations can be carried on without any closure e South Kensington Museum against the public.

Taking the buildings as a whole, they reveal an utili- n and very definite inspiration. The late Sir GILBERT T excused his efforts to make his building as fine as possible with an alien style by the indefiniteness of his uctions. His words were :—"All my earlier instruc- ; on the subject led to the idea that a very palatial ding was required. After I had carried out the first on, which contains the Foreign and Indian Offices, I told that we ought not to have done that ; but all my impressions were that that was wanted, and I aimed at In the collection of buildings we illustrate, an excuse iat description cannot be offered ; and if defects are vered they cannot all be ascribed to the architects. Government must share the responsibility. The require- s were furnished to the architects, and the limits within h they were to be realised were rigidly fixed. The lings are therefore not merely evidence of a determina- to have work done, they are also to be taken as models hat offices and museums should be according to the ; of the existing Government. As such the series h now first appears in its entirety is deserving of more ral attention than is usually bestowed on architectural ns.

'hat the QUEEN has been enabled to lay the foundation- : of the additions to the museum—the building which [ER MAJESTY has most interest—has given general satis-)n. The desire of the public now is that the QUEEN be enabled to open the new building, and in that way hance its interest to the Empire.

FRENCH ART.*

LTHOUGH many actions of the French appear to suggest their possession of more than an average of human weakness, in their art they commonly come r to perfection than any other people. Compared ours their art is national, and all classes can exult in ccess as if they were sharers in the operations. For a the French churchmen were its best patrons; their ence was caught by the nobles and by the court. Then people were made to contribute to the education and ort of artists by their taxes, and now a Minister of Fine is an indispensable element in all Governments. It is nerely by obligatory contributions the French people aid promotion of art. Whenever a promising youth appears eople in the town or district are willing to make up a fient sum to enable him to live in Paris or near one of reat provincial schools of art. In that way men who have become agricultural labourers have gained m as artists, and have brought credit to their early actors. In England the State counts for nothing in tist's career. If a painter or a sculptor has attended f the departmental schools he is generally ashamed of debtedness and would gladly destroy the records of it. t of the taxes is devoted to the schools, but the people neral are so indifferent and unknowing about the n followed in them, they cannot say whether it makes rs artistic ability.

'hy there should be so marked a difference between eoples it is difficult to decide. In all such questions peculiarities must count. Miss KINGSLEY believes t' France is the most richly-dowered country on earth, lin the characteristics of her race and in the diversity r natural gifts." No doubt the country became the of strangers, but it cannot be said that they were ed from Britain. The land of England has not always owned by Saxons, and yet who can suppose that the c sense belongs to the very soil? We also have had ught, untrained, nameless monks" working in our hes, without their negative qualities producing much ent benefit in the arts or in making art the heritage of eople.

is, however, with France Miss KINGSLEY concerns f, and to give a representation of French art in a single ne is a task which is enough to scare the boldest littérateur. The names of architects, painters and sculptors are so numerous that with the merest tombstone records about the owners they would be enough to fill a book. Miss KINGSLEY is orderly, patient and industrious, and moreover has been able to obtain the aid of many experts in France. As a consequence, her abstract of the history of art from the twelfth to the nineteenth century has much more animating power, and is more organic than is usual with attempts to present so vast a period and so many individualities before a reader's glances. Another reason is that Miss KINGSLEY seeks to demonstrate "that French art has throughout been in sympathy with the national characteristics of the country and of the peoples of France." We do not believe that artists are always without qualities that relate to the universe, and are bound by conditions arising from petty measures of time and space; still, the mere keeping of that idea always in view has helped to impart unity to the history.

In interest a history of art has an advantage over political histories. Kings, statesmen and warriors have not always left memorials of their existence. But if the artists' works are no longer conserved, we can at least imagine their appearance, and the mere thought of them gives us pleasure. It is generally admitted, for example, that in sculpture the French are more successful than in the other arts. But what a variety of attempts marks its history during eight centuries. Miss KINGSLEY informs us that, "as early as LOUIS LE GROS'S accession in 1108 we get the first faint sign of naturalism; it is shown primarily in ornament; the leaf of the French arum appears in capitals." VIOLLET-LE-DUC speaks of the delight which the early sculptors must have had in the possession of so simple a thing as a leaf or a weed at a time when property was supposed to be the endowment of a few. The twelfth-century carver who attempted with clumsy tools to represent the qualities of a plant was probably one of the happiest men to be found at the time. How different was the state of his mind if compared with that of the sculptor who comes last in the pages of the history, viz. M. ALBERT BARTHOLOMÉ. He has devoted himself to funeral sculpture, not because it is profitable in Paris, but from its correspondence with his thoughts. His masterpiece is the solemn memorial of departed and departing humanity, a work of which a part was seen in the Champ-de-Mars a few years ago, and is to be erected near the entrance to Père Lachaise. As Miss KINGSLEY tells us, "It is not to commemorate one person, one century, one race, this great Monument of the Dead, but to serve as a memorial to all—gentle and simple, statesman and communard alike, known and unknown, the young and the old, who have travelled the unknown road." Whether we consider the mysterious doorway with its flanking and frightened figures as marking the end of an era or the beginning of one, it is equally saddening, especially if taken as a commentary on the majority of figures which appear in annual exhibitions. It is an embodiment of pessimism, a mode of considering things which happily could not have afflicted the shaggy sculptor to whom the arum leaf was a symbol of the endless enjoyment which awaited him when his hand was no longer strong enough to carve capitals.

In painting we have a similar phenomenon. We are told that "the earliest paintings are to be found in missals." As the illuminator in his monastic cell was free from the everyday troubles of the mason, he was able to give his whole thoughts to his art. To him the world was intended to be a beautiful place, of which flowers were the surviving tokens, and although he was ignorant of the arrangements which are now familiar to botanists, he was assured in his simple faith that SOLOMON in all his glory was not equal to a lily from the convent garden. There is as much difference between the placid life of the monastic artists and the combats of modern painters for recognition as between modern painters' work and the miniatures in the missals. Take the life of EDOUARD MANET, the representative of Impressionism, to which Miss KINGSLEY devotes as much space as if the painter were her particular idol. His family opposed his choice of a painter's career. He entered the atelier of COUTURE, the painter of *The Decadence*, who "was specially severe to any student who showed signs of originality." He was forced to become his own instructor. His works were excluded from the

* *A History of French Art*, 1100-1899. By Rose G. Kingsley, r de l'Instruction Publique. Longmans, Green & Co.

Salons and from the International Exhibition of 1867. Although M. DURAND-RUEL invested 50,000 francs in paintings which the crowd despised, MANET was considered as an ISHMAEL until 1878, and if it were not for the courage of ANTONIN PROUST the artist's name would not be allowed to appear on the roll of the Legion of Honour, where so many mediocrities are found. MANET did not long enjoy the distinction. The artist, who was a pioneer of the "plein-air" school, was no doubt as sincere an admirer of creation as any of the monks; but the conditions under which art is practised in the nineteenth century are different.

As for architecture, we all know too well how far the present is unlike the past in acceptance of the grandest of arts. Miss KINGSLEY, in describing pre-Renaissance work, says:— "Gothic architecture is a living thing. In its constructive system, in its decorative system, it is instinct with life. It is to nature that it goes for its decorative system. It is to the profoundest principles of mechanical science that it goes for its constructive system. And thus the pure Gothic building rises from the earth like the tree in the forest, its living beauty co-existent with absolute obedience to architectural laws. The charming legend at Laon, which tells how the oxen harnessed themselves to the carts to transport stone for the cathedral up the precipitous rock on which it stands, is but typical of the fervent religious enthusiasm which possessed the whole population, and the zeal with which they voluntarily gave themselves over to the building of innumerable churches and cathedrals." But whatever may be thought of architecture by the world, there is no doubt its representatives continue to be as faithful to nature and its statical principles as were their Gothic predecessors. The Galerie des Machines in the Champs-de-Mars was supposed to be essentially a novel construction, and in its dimensions it was almost without precedent, but the proportions of the parts were determined by a process not unlike that employed for a Mediæval cathedral. M. DUTERT, the architect, is not merely an adept in mechanics. He also goes to nature for his decoration. In describing his new Museum of Natural History it is said:—

> M. Dutert has had the courage to return to the methods of the Gothic architects, and to seek his suggestions for decoration in the natural world. Therefore, as he has built a Museum of Natural History, his capitals are no longer Doric, Ionic or Corinthian, but formed of gigantic lions and lionesses. The round-headed arcade of the principal door is composed of great palm leaves; the band above of cockle-shells. Along the bands of shells, in very faint relief, which separate the two storeys, huge birds of prey spread their wings at intervals, each the work of sculptors such as MM. Gardet, Valton, Boutry, Louis Noël, &c., and each forms a crown of the arcade of the ground floor. It is one of the best and most striking portions of the building. Saurians and crustaceans are used as consoles to some of the upper windows, and while they represent rare or extinct species, they are always so interpreted as to lend themselves to the strict architectural necessity of their position. Lines of shells replace the usual dentils beneath the windows, and insects decorate the gutter below the roof, while in the interior the beautiful balusters and balconies of stairs and galleries are composed of iris, ferns, chrysanthemums and laurels, absolutely true to the nature of each plant and yet subordinated to the exigencies of architectural harmony.

It will be observed from what we have said that Miss KINGSLEY endeavours to grasp principles, and although her work must mainly be biographical, she is able to realise the influence exerted by artists and the influences which have acted upon them. The reader feels there has been evolution, although in some things there may not be improvement. The forces which are still in operation are necessarily the most interesting to artists and lovers of art. Accordingly, one-half of the book is assigned to the art of the nineteenth century, an arrangement which is sure to satisfy the majority of readers. In dealing with the artists of the period, Miss KINGSLEY shows her good sense. DAVID is commonly supposed to have been more academical than the Academicians, and his big classical scenes are enough to freeze a visitor when they are seen in the Louvre on a winter's day. But Miss KINGSLEY is right when she says that he was the father of modern art, and "that face to face with the living human being DAVID'S genius seems vitalised by the contact." The portrait of MARAT is cited as a proof of his modernity. THACKERAY considered DA portrait of a washerwoman was excellent, and he spea single figures as full of life, truth and gaiety. DAVI no colourist, and INGRES, who was one of his pupils, v colour at so low a rate that he said, "A thing well dra always well enough painted." INGRES'S works are, how far richer in colour than DAVID'S. Miss KINGSLEY a the credit to DELACROIX of bringing back the colou methods of the great masters to France. It wa ambition of DELAROCHE to be the modern eclectic by bining the methods of DELACROIX and INGRES, but ac ing to Miss KINGSLEY no artist's reputation has ever su more disastrous defeat and calamity from his too en astic disciples than that of PAUL DELAROCHE, when his death they organised an exhibition of his DELACROIX, INGRES and DELAROCHE adorned buil with their paintings. But, as Miss KINGSLEY says speaking of PUVIS DE CHAVANNES, "In decorative pai it is not enough to cover an immense canvas with pain people. The building for which it is destined, exigencies of position, must be ever present to the a eye in his vision of the whole, which is to enhanc beauty of architectural line, that inflexible setting in his conception is to live."

The landscapists would be worthy of a volume. hard a struggle some of them were compelled to take p is suggested when we learn that during thirty years C never sold a picture. THÉODORE ROUSSEAU was an sufferer. The Academicians kept him out of the his crime being his devotion to nature. Then ther peasant painters like MILLET and COURBET, who appeared to have been born in an age which coul comprehend them. The military painters were fortunate, for they were capable of depicting scenes of all Frenchmen were proud. Compared with painters sculptors, the architects' lives will be considered romantic and prosperous, but the capable men to wo the public are indifferent and will give no commission buildings have to pass away without the consolatio knowing they are to have a line or two in a history of Miss KINGSLEY is sympathetic towards all artists, and occasional revelations of a kindly woman's nature inc the interest of her book.

ROYAL INSTITUTE OF BRITISH ARCHITE

AN ordinary general meeting of this Institute was h Monday at No. 9 Conduit Street, Regent Street, fessor Aitchison, R.A., the president, in the chair.

The minutes of the last meeting having been taken a Mr. H. H. Statham read a paper on

The Architectural Element in Engineering Wor

of which the following is an abstract:—

The author said he hoped no member of the In supposed that this paper was intended in any sense as an on the engineering profession. So far from entertainin such intention, it seemed to him that in the century just ing to a close engineers had played a far more importa n the world than architects. This was partly, no doubt, to circumstances not altogether within their own contr which they had turned to splendid account. The enc development of locomotion by means of steam power, would be remembered in history as the great character the present century, had led to a demand for immen structional works all over the world for the crossing of valleys and estuaries. The viaduct was to the nine century what the cathedral was to the twelfth, thirteen fourteenth centuries.

Many persons, artists especially, had been mour indignant over this, and complained that the world was covered with structures which had no beauty. He h much sympathy with this constant depreciation of en and their works, and considered it to be very much exagg What was the real mistake of modern engineers he come to presently. But in regard to a large proportion purely utilitarian structures which had been erected neers, he held that there was a great deal more of int them than many of those who complained of them were perceive. Structure was in itself a subject of interest, and those who could find nothing to in a great piece of construction devised to ov a practical obstacle to intercommunication or loco

evidence not so much of a superior as of a ded education. You could hardly design a structure to me a great natural obstacle, or to resist one of the forces of nature, without giving it a certain character, an st of its own, provided it was carried out in a simple and cted manner, and with direct reference to its practical se. You could not build a stone bridge across a river t producing a fine object in the sweep of the arch and sisting mass of the abutments. A suspension bridge, with the catenary curve of the chains designed for us, as , by nature herself, was so beautiful an object that it was lingly difficult to spoil it. Engineers had succeeded in g it in some cases, as he would have occasion to show, was because they were not always content to let ne sufficiently; and where the span to be bridged was e one, even the girder was redeemed in our eyes, or l be, by its obvious practical suitability to its purpose. irdo-phobia, as we might call it, of many artists and s of æsthetic sensitiveness was exaggerated. A girder was certainly not so pleasing in its lines as an arch or ension chain, but, after all, it was only a beam on a large If a structure of this kind was let well alone, simply d as a piece of unadorned construction, it would in a make its own æsthetic. On the Intercolonial Railway in la, across a good many of the minor valleys the line was d on lattice girder bridges supported on simple rect- ar pyramids of undressed stones, rather wider at the top the width of the girder, without any "treatment" of nd, the girders being just laid across the tops of these piles. These really looked quite picturesque; it was the oor rustic bridge on a large scale.

ing through some lantern illustrations of engineering of a practical and unadorned character, among others ld point to the lattice girder bridge near Fribourg, on ttice piers, as an erection which illustrated favourably gument that perfectly frank display of structure in engi- g works, with no pretence at ornament, was not offensive uresque effect; at all events he could not regard a struc- ke this as an injury to the landscape. The same remark d to the Crumlin Viaduct, a structure of the same class. ether the Forth Bridge was or was not an ugly thing was a n which there might be a difference of opinion. Pro- it would be viewed in different lights according as people anything about construction or not. Those who did, ed it with interest; those who did not, probably with bewilderment. As to artistic or decorative treatment, tempt at that in a work of this kind would have been piterous and would have defeated its own ends.

ming to the arched masonry type of structure, after ning some older examples, he referred to Kingston e, London Bridge and new Putney Bridge, all very fine ures which had this quality in common, that they were d with the greatest breadth and simplicity, relying for effect entirely on the disposition of the masses of ry, not even indulging in the use of an order on the s

king bridges in which masonry was used in combination on construction, we had in the Victoria Bridge over the wrence a remarkable example of what was suggested —that a structure built to resist the forces of nature almost always have character and interest. Here we mple massive stone piers, which on the up-stream side were ill out in long spurs to meet and break up the ice coming after the thaws. There was not a particle of ornament, e piers and the great box girder laid like a beam over formed a most impressive structure, which would only be ed by any attempt at ornamental treatment. The Tubular Bridge was built amid many criticisms to the that it was a thing of no beauty, which would be an to the effect of the suspension bridge, &c. Yet Hamerton, the most discerning and enthusiastic of art critics, wrote me time after:—

"he whole bridge is admirable as a work of art, though is very simple and severe. The long line of tube (which like a great beam) is fortunately broken by the piers of which are finished above the beam as towers, and the y that naturally belongs to a work of colossal size and is enhanced by the prudent use of some architectural ent. The tubular bridge over the river Conway near stle is less fortunate, because the neighbourhood of a Mediæval building led the architect of the bridge to adopt llated style for the entrances to the tubes—a style which be more or less in harmony with the fortress, but would y in any other situation have been chosen to accompany e which was nothing but two parallel beams."

king examples of suspension bridges, the Menai Sus- n Bridge was in every respect one of the most beautiful res of any kind in England. The simple but massive ent of the towers, spreading toward the base, was admir- ited to their situation and function. All the things they en looking at hitherto were characterised by simplicity, sometimes showing nothing but the unadorned construction. It was within the last quarter of a century or so that the minds of engineers had been poisoned with the terrible ambition to produce "handsome" structures, and in the endeavour after that they had entered on a field for which their training had in no way fitted them. It seemed impossible to get engineers to understand that the handling of decorative architectural detail was a matter requiring special training.

The two mistakes we most frequently met with in these ornate modern engineering works were coarseness of design in ornament and mouldings, and want of perception of scale. In fact, it appeared that engineers hardly realised what scale meant, and thought that a detail which was good on a small scale was good on a large scale, which by no means follows. Scale might be regarded in two lights. It consisted, firstly, in so proportioning all the parts and details of a design that they should have a harmonious relation to one another, which might be called perception of scale in the abstract. There was also what might be called conventional scale: the recognised and habitual proportion to each other of details (such as those of the orders) which had by long use come to have a certain recognised relation to one another, so that a use of one of them on an entirely different scale to what we were accustomed to confused our sense of proportion in the structure. This sense of scale was conventional and acquired, no doubt; but if these conventional materials of architectural design were made use of at all, they ought to be used with knowledge and not at haphazard. After citing some examples, especially Blackfriars and Hammersmith bridges, of bad detail and falsity of scale, he directed attention to illustrations of the bridge at Coulouvrière, near Geneva, which was understood to have given the suggestion for the Vauxhall Bridge design. The general aspect of the Coulouvrière Bridge, from a distance, was picturesque, but the details would not bear examination, and in fact, from an architect's point of view, it was a very bad design. The columns on the bridge had no proper foundations, but were bracketed over the side in a very clumsy manner. The decorative details showed badly-designed rococo ornament meandering partly over the surface of rusticated quoins, to which they bear no relation. The archivolts of the arches were strongly emphasised by sham quoins of very pronounced character, executed in cement in imitation of stone. In the Vauxhall Bridge design immense quoins, with a rustication of 1 foot projection from the wall-face, were carried round the archivolts. The defect of this design in regard to appearance was that it was unusually thin at the crown of the arch; the concrete construction allowed of this, but in facing it with granite the visible arch looked exceedingly thin and weak at the crown. By emphasising the archivolt course by rustication, and at the same time entirely separating it from the spandrel masonry, which was kept quite flat, this thin and weak appearance of the visible granite arch was increased; and at the same time the large and deep cornice, of very coarse mouldings, still further reduced the visible depth of the arch at the crown. The details showed a complete ignoring of scale. The single moulding which crowned the plinth of the main piers was nearly 3 feet in vertical height, and this magnified moulding operated to reduce the whole scale of the rest of the work, making the quoins on the face of the pier, which were really very large, appear trivial; while the insertion of a necking moulding on the semicircular projection on the face of the pier at once transformed it to a column of immense thickness, and quite out of proportion to any function of a column in such a position. The whole thing was a jumble of incongruous details, put together by some one who did not understand the language of architectural design.

The problem of treating a concrete bridge with a granite facing was, in fact, rather a new one; the granite was here, in reality, only what the French call a *revêtement*, and should be treated accordingly.

In regard to the general subject of the designing of bridges, he would suggest that if it was urged that, in the case of bridges which were to be decoratively treated, the engineer should be assisted by an architect, why should it not be put the other way about—that an architect should build the bridge assisted by an engineer? Architects were not familiar with the problems incident to forming foundations in deep water, in the bed of the sea or of a river; but as soon as the structure cleared the water, if it was to be an architecturally treated bridge, it was really more of an architect's business than an engineer's. But he feared that this was throwing an apple of discord on the board.

In Connection with the building of the new East Sussex Asylum at Hellingly, the County Council, finding the tenders from contractors unsatisfactory, have determined to make the bricks themselves, and have decided to purchase machinery and plant to the value of 4,700*l*. They also mean to lay down and maintain a tramway from Hellingly station to the asylum. The purchase of the necessary land and the making of the roadway for the tram will cost about 10,000*l*.

THE DECORATION OF ST. PAUL'S.

THE following memorial from Messrs. John Belcher, John F. Bentley, Reginald Blomfield, J. M. Brydon, James Brooks, Basil Champneys, T. E. Collcutt, Alexander Graham, M. E. Macartney, E. W. Mountford, W. C. Marshall, E. Newton, F. C. Penrose, Beresford Pite, E. S. Prior, E. R. Robson, J. Oldrid Scott, J. J. Stevenson, Leonard Stokes, E. P. Warren, Thomas H. Watson, H. Wilson and R. Seldon Wornum has been presented to the Dean and Chapter of St. Paul's :—

In a letter to the *Times*, which appeared on May 6, Sir W. Richmond has to all intents defied the instructed opinion of this country in regard to the decoration of St. Paul's. We, the undersigned architects, therefore feel it our duty to protest against the continuance of the works of decoration until full opportunity has been given for the consideration of the whole scheme by the best expert opinion available. St. Paul's Cathedral is the most characteristic of our national monuments. It is now in imminent danger of losing the grave dignity which has endeared it to the heart of the majority of Englishmen, and, in our opinion, this is due to the fact that Sir W. Richmond's scheme, whatever its abstract merits, has not been thought out in sympathy with and in subordination to the architecture of the cathedral.

1. The chief inspiration of Sir W. Richmond's design has been sought in Byzantine art, with certain motives suggested by English designers of this century. It would be impossible to conceive anything more alien to Wren's genius and to the intellectual atmosphere in which he lived and worked.

2. In St. Paul's Cathedral, as in any other masterpiece in architecture, a certain scale has been set by the original designer which cannot be abandoned without serious injury to the effect of the whole building. The scale that Wren intended was followed by Stevens in the designs that he made for the spandrels under the central dome, and the discrepancy between this scale and that adopted by Sir W. Richmond can be measured by a comparison of the figures on the spandrels with Sir W. Richmond's figures in the half-domes over the canted angles below. In our opinion a fatal injury is being done to the proportions of St. Paul's by this substitution of Sir W. Richmond's scale for the scale of Sir Christopher Wren.

3. The decorations now being carried out involve actual injury to the stonework of the cathedral as left by Wren.

In the four great arches at the N.E., S.E., N.W., and S.W. angles under the dome, Wren, in order to satisfy the eye as to the constructive stability of his arches, left plain piers or abutments under the arches, and he deliberately abstained from any ornament to these piers in order to make clear the idea of strong support, which is their actual function. Sir W. Richmond has formed raised panels on these piers and studded the margins and divisions with *paterœ*—that is to say, Sir W. Richmond has stultified the architect's design, and in nearly every detail of his decoration he has, in our opinion, shown the same indifference to the clear intention of the architecture.

Sir William Richmond has practically admitted his dislike of that architecture in his letter of May 6, a letter more remarkable for its courage than for any appreciation of the gravity of the case. It seems to us that an artist so evidently out of touch with the conditions of his work should not be permitted to alter the character of the finest work of modern English architecture, and this feeling we believe to be that of the great majority of intelligent and educated Englishmen. We desire in no way to disparage Sir W. Richmond's attainments and well-earned reputation, but we cannot regard them in comparison with the fame of Sir Christopher Wren and the loyal preservation of his work. We protest as Englishmen against this subversion of the character of our national cathedral, and we resent, as artists and admirers of Wren, this tampering with the intention of one of the greatest of English architects.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE last of the monthly meetings of this Society for the present session was held in the library at the National Museum of Antiquaries, Queen Street, Edinburgh, on May 8, Sir Arthur Mitchell, K.C.B., M.D., LL.D., in the chair. In the first paper, Mr. John Bruce, F.S.A.Scot., Helensburgh, gave an account of the excavation of a pile structure situated near the Hill of Dumbuck, on the north bank of the Clyde, and about a mile to the east of Dumbarton Rock, which was discovered last summer by Mr. W. A. Donnelly, artist, Milton of Colquhoun, and excavated for the Helensburgh Natural History and Antiquarian Society, under the superintendence of Mr. Donnelly and the late Mr. Adam Millar, secretary of the Helensburgh Society, and Mr. John Bruce, F.S.A.Scot. The situation of the pile structure being within high-water mark rendered the work difficult, but by persevering efforts its remains were freed from mud and silt, and a ground plan and sections carefully made. The structure is circular, having an outer circumference defined by tw seven piles, enclosing an area of about 56 feet in dian within which is a series of layers of tree-trunks and brush chiefly of fir, alder and birch, the outside piles being of In the centre is a circular space defined by stones, and dis around it, in the space between it and the outside ring of there were five circular paved spaces, outlined by smaller wood piles, placed about 2 feet apart. These all rested o substructure of tree-trunks and brushwood, which again rest the bed of blue clay forming the solum of the river valley. 20 yards to the north-east a canoe hollowed out of an oal trunk, 35 feet 7 inches in length, 4 feet in breadth at the which was square, and 2 feet in depth, was discovered lyin sort of dock, the walls of which were defined by piles at inte and partly formed of wood and stone. A kind of caus connected the dock with the pile structure. About 12 to 1 outside of the ring of piles defining the margin of the stru there was a construction in the nature of a breakwater, was in the space between it and the enclosed pile stru proper that the refuse heap, containing a quantity of bo animals mixed with charcoal and ashes and other débri discovered. Among the refuse, and here and there amon débris of the site, were found a considerable numb implements and other objects of stone and bone. Among are several spearhead-like objects of slaty stone scratched ornamentation, several small rude and grot imitations of the human figure in shale and cannel coa mouth in some cases represented by the hole by the figure is suggested to have been hung as a pen and other small stones of various shapes, and oyster-s incised with lines or with small pittings in the surface arra in groups. Some hammer-stones and a quern, 18½ i diameter, were also found. Both on account of the char of the structure itself and the unusual nature of the ob found in it, there had been considerable diversity of op among archæologists ; but the author was confident that would throw light upon the archæological relations of h structure and the Dunbuie fort, which had yielded ob of similar character. The bones of the animals f have been provisionally determined by Dr. Traquair as in ing the "Bos longifrons," or ancient short-horned ox, ulna of which has been often shaped into impleme the sheep, the swine, the horse, the red-deer, and the roe-d Unfortunately, the boxes containing the bulk of the implem and relics, which had been despatched by rail some days re vious to the meeting, had not arrived, but will be exhibited sequently. Dr. Munro indicated his opinion that this w stone structure, superimposed on a basis of piles and horiz timbers, and that it belonged to a period later than the Ro occupation. Sir Arthur Mitchell commended the mann which Mr. Bruce had presented the record of a pie scientific work of great interest, and expressed the regr the Society for the death of Mr. A. Millar, who had associated with Mr. Bruce and Mr. Donnelly in this explor

TESSERÆ.

"What's in a Name?"

AS in a good many other things, nominalism is the sour no little mischief, error and humbug in architecture puts us off with mere delusions—words, names and instead of realities. Because the style which a building be described as belonging to—for want of other mea indicating the mode it affects—is good in itself, it nom ranks as being of it, although it may be a positive disgra it. Notwithstanding that the contrary opinion seems to pra there is no talismanic power in the name of a style. Gri Roman, Italian, Gothic may be all alike rendered detes thoroughly mean and paltry ; and when that is the cas excellence of the style adopted only renders failure in more ignominious, proving that he who has attempted to has neither understood it nor had the least feeling for it. name of a style is of infinitely less importance than the m in which it is treated. Instead of taking one that is merely to emasculate, impoverish and vulgarise it, it wou far better to make use at once of what is considered a one, and try to infuse some spirit and quality into matters little what style an architect employs, if out of th best he can only produce what is decidedly unsatisfa Before determining upon what style he shall select, an tect would do well to ask himself if he can treat any style with geniality. Unless he be content to be nothing mor a mere builder, geniality is a *sine qua non* pre-requisite f who would not unworthily write himself architect. Ca indeed, we have no right to demand, because it cann commanded even by the most diligent and the most z but geniality—intense relish for his pursuit, earnest an application to it, generous and enthusiastic devotion to it not unreasonably be looked for in him who enlists und

ers of art, which is presumed to admit into its service only nteers. A coward in a red coat is less pitiable and contible than he who enrols himself in the ranks of art, though cious of his own disqualifications, and animated by no er stimulus than the hope of pay and plunder.

Inigo Jones and the Stage.

nigo Jones may be considered the father of scene-painting ngland, and it is reasonable to suppose, from his acknowed talents, that the little stage which he prepared for the ate theatre at Whitehall could not be wanting in scenery, hinery and decorations that would be admired even in these s. Walpole, with reference to these elegant masques, rves :—"During the prosperous state of the king's affairs pleasures of the court were carried on with much taste and nificence. Poetry, painting, music and architecture were alled in to make them rational amusements, and I have no ot but the celebrated festivals of Louis XIV. were copied the shows exhibited at Whitehall, in its time the most e court in Europe. Ben Jonson was the poet; Inigo Jones nventor of the decorations; Laniere and Ferrabosco comd the symphonies; the king, the queen and the young lity danced in the interludes. These pieces, which originin the reign of James I., were sometimes composed by mand of the king in compliment to the nuptials of certain lity of his court, a custom productive of much good, by uraging marriage among the young nobility, the best rity for that dignified and virtuous conduct which regulated ouseholds of our great families of old, and rendered the hbourhood of a palace or a noble seat desirable in proporto the virtues of their noble possessors." On occasion of marriage of Robert Earl of Essex with the Lady Frances, hter of the Earl of Suffolk, a Hymenæi, or solemnities of sque, was performed at court on Twelfth Night, 1606. In piece, which was written by Jonson, Master Alphonso abosco sung; Master Thomas Giles made and taught the es. That this great English architect designed these antic and chaste amusements with taste we may infer from ncomiums of his compeers, for the masque presented on creation of Henry Prince of Wales, June 5, 1610, which written by Daniel, induced the author to make known t the machinery and contrivance and ornaments of the es made the most conspicuous part of the entertainment." masque was entitled the "Queen's Wake." Three years equent to this period, on the marriage of the Count Palatine e Rhine and the Princess Elizabeth, a masque was per-ed at Whitehall, composed by Chapman, a dramatic r of eminence and contemporary of Shakespeare. The t of our first scene-painter for his share in the getting up e piece is thus set forth :—"Invented and fashioned by our dom's most artfull and ingenious Architect, Inigo Jones. superb exhibition was provided in compliment to the royal at the expence of the gentlemen of the societies of the lle Temple and Lincoln's Inn, at the cost of 2,400*l.* and rmed at court." It should be observed that these masques introduced into England by the queen of James I. We therefore place the introduction of scene-painting in and in the reign of the royal father of Charles I., however n the art might have been improved under the reign of this reign.

Pope and Painting.

pe, the poet, really loved painting for its own sake, and worked daubed as inveterately as though he had been labouring in est for a seat in that society of painting, sculpture and itecture which had been talked of from the time of Charles I. met Sir Godfrey Kneller; the painter gave the poet a re, and the poet returned the compliment in a copy of verses. Pope's intimacy with the picture-makers was not confined ir Godfrey Kneller; he had a great crony in Charles s, they were inseparable; and his friendship for the hy Jonathan Richardson, of Queen Square, was no less g. His friendship for Jervas commenced early in life. A mporary, who knew his history well, observed, "He e) took delight when a child in drawing, and afterward g had masters for that purpose, made a tolerable good cress soon." His letter to his dearly loved John Gay, dated ist 23, 1713, will best express how meanly he thought of s rst essays in the sister art, after having his eyes opened to superior merits of painting by his friend Jervas. In it he :—"I have been near a week in London, where I am o remain till I become, by Mr. Jervas's help, 'Elegans arum spectator.' I begin to discover beauties that were ow imperceptible to me. Every corner of an eye or turn nose or ear, the smallest degree of light or shade on a k or in a dimple, have charms to distract me. I no er look upon Lord Plausible as ridiculous for admiring a s fine tip of an ear and pretty elbow (as the 'Plain ler' has it), but I am in some danger even from the ugly disagreeable, since they may have their retired beauties in part or other about them. You may guess in how uneasy a state I am, when every day the performances of others appear more beautiful and excellent and my own despicable. I have thrown away three Dr. Swifts, each of which was once my vanity; two Lady Bridgewaters, a Duchess of Montague, half a dozen earls and one Knight of the Garter." How it happened that the Dean of St. Patrick's, restless and fidgety as he was known to be, and a grudger of time to any idle purpose, could afford his sittings to Pope for three portraits no one has yet been vain enough to account for. There remained an uninterrupted friendship between poet and painter until dissolved by the death of Jervas in 1739. Jervas, who was a native of Ireland, went to Dublin to paint portraits. Pope meanwhile took up his abode in the painter's house in London, and there by way of relaxing from the laborious drudgery of transforming Greek phrases into English ones (for as he himself facetiously says, "A translator is no more a poet than a tailor is a man"), he toiled at the easel for a part of each day.

Landscape Art.

The practice of an artist in the study of nature is carefully to distinguish between those associations he has imbibed from nature at large, and which are cherished by all, and those which owe their origin to accident, or local observation and habit; he must likewise distinguish the effects of their application. The acuteness of his researches should not so much be directed to the discovery of beauties, which make no impression on others, as in the powerful and faithful representation of those scenes, tones of colour and effects in nature with which mankind have always been delighted; and in recalling impressions, which all receive, but which in many have lain dormant until awakened by the hand of the painter, who (conscious of the great force nature derives from motion, and a thousand objects and minute gradations of tints in unison with and auxiliary to the general effect, which cannot be imitated) nevertheless surmount these obstacles by the omission or concealment of those objects which in nature are inconsistent with the general sentiment, and not content with being consistent only, makes every object expressive of that sentiment which roused him to the attempt and is the ruling character of the scene. Now, as light, shade and colour form a great portion of the impressions of most scenes in landscape, by a judicious attention to them he can obscure those objects which cannot, though unpleasant to the eye in a view, be dispensed with, and increase the effect of those on which the subject principally depends; and from subjects, trifling in the estimation of common observers, form a picture so forcible and imposing, and one that owes so much to his own taste and powers, which are so artfully exerted, that every spectator, conscious of the general truth of the objects delineated, wonders that they had ever escaped his notice before. An artist should be more anxious to create general beauties than to avoid partial errors, as by the first he is sure to strengthen his imagination, and always produce something marked with character; but by the last his works will be generally insipid, which is the greatest of all faults in any one pretending to works of imagination.

Assyrian Buildings.

There are buildings in Assyria which so far differ in their sculptures, in their mythological and sacred symbols, and in the character and language of their inscriptions, as to lead to the inference that there were at least two distinct periods of Assyrian history. We may, moreover, conclude that either the people inhabiting the country at those distinct periods were of different races or of different branches of the same race, or that by intermixture with foreigners, perhaps Egyptians, great changes had taken place in their language, religion and customs between the building of the first palace of Nimroud and that of the edifices at Khorsabad and Kouyunjik. The names of the kings on the monuments show a lapse even of some centuries between the foundation of the most ancient and most recent of these edifices. From the symbols introduced into the sculptures of the second Assyrian period, and the Egyptian character of the small objects found in the earth above the ruins of the buildings of the oldest period, there was a close connection with Egypt, either by conquest or friendly intercourse, between the time of the erection of the earliest and latest palaces, and that the monuments of Egypt, the names of kings in certain Egyptian dynasties, the ivories from Nimroud, the introduction of several Assyrian divinities into the Egyptian pantheon, and other evidence, point to the fourteenth century as the probable time of the commencement, and the ninth as the period of the termination of that intercourse. The earlier palaces of Nimroud were already in ruins and buried before the foundation of the later, and it is probable they may have been thus destroyed about the time of the fourteenth Egyptian dynasty. The existence of two distinct dynasties in Assyria, and the foundation, about 2,000 years before Christ, of an Assyrian monarchy may be inferred from the testimony of the most ancient authors, and is in accordance with the evidence of Scripture and of Egyptian monuments.

NOTES AND COMMENTS.

IT is generally supposed by frequenters of Parliamentary committee-rooms that gas and water companies are more influential in the House of Commons than railway companies. We are not surprised that the Sutton, Southcoates and Drypool Gas Company believed they were able to block out a man's lights and commit other damage to houses with impunity. They possessed Parliamentary powers, and what was the advantage of the privilege of the company must be treated like an individual? A big gasometer which was 70 feet high was enlarged and extended to a height of 105 feet. In the course of the operations springs were tapped by cutting through a bed of silt, and the plaintiff's houses were flooded. Mr. Justice NORTH granted an injunction restraining the gas company from further elevating the gasometer, and awarded 340*l.* for the damage by the flooding. The company considered that hard treatment was meted out to them and appealed. The case was heard last month and judgment was given on Tuesday. There was a division of opinion among their lordships. The Master of the Rolls declined to consider a gas company as being in the same position as a railway company, for it was distinctly stated in one of the general Acts relating to gasworks that "Nothing in this or the special Act shall exonerate the undertakers from any indictment, action, or other proceeding for nuisance in the event of any nuisance being caused by them." The judgment in DALTON *v.* ANGUS relating to the question of support was applicable to the gas company. The equilibrium of the foundations of the plaintiff's houses was disturbed, and the company must be held responsible for what was an actionable nuisance. But, strange to say, the Master of the Rolls was obliged to admit there was no English case relating to cutting through quicksand, and he therefore relied on a judgment given in the Supreme Court of Massachusetts by Chief Justice FIELD, who said:—"Whatever may be true of percolating waters, we think that the defendants had no right to take away the soil of the plaintiff in land which they had not taken under the statutes, and that it is immaterial that the soil was removed by means of pumps from the trench into which it had fallen by its own weight, or had been carried by percolating water. We are unable to distinguish the case from one where the soil falls in from the surface in consequence of an excavation in the adjoining land." Lord Justice RIGBY agreed with the Master of the Rolls in dismissing the gas company's appeal. Lord Justice VAUGHAN WILLIAMS held that "an obligation not to withdraw water support from under your neighbour's land by digging or excavation in your own land is an obligation which may well be unwittingly contravened, for it is practically impossible in such a case to predict at what point or at what distance the withdrawal of the equal pressure of the water may cause motion or subsidence in the soil previously affected by water pressure. To affirm the right of support is to affirm that no land can be drained, or well or trench dug without the risk of an action for letting down the surface of neighbouring land." Neither in English nor in Roman law could his lordship find authority in favour of the right of support by water. As the majority took the other view the appeal was dismissed.

THE fountain in the Place du Châtelet, Paris, is now called the Palmier, from the column having a resemblance to a palm tree tightly enclosed in bands. It was formerly known as the Fountain of Victory, from the figure offering two laurel wreaths with which the column is surmounted. But with more reason it could be described as the Fountain of Sphinxes, for four of these figures are employed to emit water. In its first state the water came from four cornucopias. The fountain was constructed in 1807 from the designs of BRALLE, the architect, who secured the aid of BOSIO, the sculptor, to co-operate with him. The idea was ingenious. The bands encircling the column served for inscribing the names of places when French troops conquered. At the base of the column are figures to typify Faith, Vigilance, Law and Force. Originally the fountain stood in the Place du Châtelet, about 40 feet distant from the present site. It was found to be an obstruction to the new Boulevard de Sébastopol, and in 1858 M. BALLU, the architect, was instructed to remove it. The fountain was, inclined to a horizontal position, and then moved *en* [illegible] On arriving at the place arranged it was raise machinery to a new pedestal, with the four sphinx supporters. M. BALLU superintended the operations, were performed in about twenty minutes. The fou was lately allowed to become dilapidated, but it is n the hands of restorers.

ALEXANDRE DUMAS fils was one of the most sighted judges of pictures to be found in Paris. Fr friendship with painters he was able to obtain wo much less than their market value. It was allege while he was supposed to be buying as an amateur f own gratification he was really speculating in pictures. a man of his standing could not escape slander. made plain in one of the Paris law courts a few days ag with all his acuteness DUMAS was occasionally dec About fifteen years ago he bought a landscape calle *Fontaine des Gabourets*, which bore the name of C After a time it was ascertained that the painte M. TROUILLEBERT. An action was taken against h the author of a falsification, but he demonstrated th signature was covered by COROT's name and witho knowledge, and was acquitted. Recently a writer in ce the Paris journals related the story, but apparently n nothing of the defence or of the issue of the trial. TROUILLEBERT at once commenced an action, whic gained; a fine was imposed, and an apology has to appe thirty journals. A landscapist whose work is made to as COROT's, to the deception of a judge so competent younger DUMAS, should command the attention of lov French art.

WHEN EMERSON visited England he describe country as appearing to have been finished with a pi That was not altogether paradoxical, for in Ameri could then see very little land which corresponded wit market gardens and lawns of England. His own gard Concord preserved much of the primal wildness. Americans of our time are less disposed to allow natu have her own way. Landscape gardening is now a recogn profession in America, and there are architects who ar indisposed to make it a part of their business. In fact art is now becoming known as landscape architecture. requirements according to the American standard lately explained to the members of the Brooklyn Ins by Colonel JOHN Y. CULYER. According to him, the fession of the landscape architect is one that both me women may adopt with advantage. Feminine taste feminine love of nature will find many opportuniti display. One or two women in the States have al gone into the study actively. The prejudice tha existed in some quarters against landscape arch ture as not being a legitimate department o work, the Colonel said, is breaking down, the profession is receiving the recognition th deserves. In giving hints to the intending studen Colonel said that a common school education was pr requisite, high school training was desirable, and a c education even more so. Drawing and designing, knowledge of mathematics, acquaintance with bo horticulture and forestry, knowledge of methods of construction, and, above all, ability to grapple with ra tical problems, are among the numerous acquire demanded of the landscape architect. His work i confined to city parks, but also includes the laying u private estates, caring for rural forest areas and for and Governmental reservations. The Colonel's progr suggests a new scope for the activity of his countr But we wish he had also said a word or two abo advantages of masterly inactivity. Nature sometimes s be let alone, and in America especially.

Autun—Moulins sur Allier.

THE separation between the two great architectural divisions of France may be effected by a line drawn across its map in an oblique direction from the mouth of the Loire to Lausanne. In the provinces to the north of that line we find the churches of an earlier age replaced either entirely or in greater part by others, the outcome of that great age of architectural enthusiasm comprised between the last twenty years of the twelfth and the first half of the thirteenth centuries.

Southwards, church architecture after reaching a certain point stood still, never except in a few instances being carried to such perfection as in the north.*

Pointed arches, domical vaults over large spaces, and an excellent school of sculpture had, it is true, made their appearance in Aquitaine and Burgundy half a century before Normandy, Picardy and Champagne received them, yet the people of those provinces had attained to much greater elevation in their buildings and more expansion in their ground plans, so that all things considered the two schools were tolerably well balanced.

N.E. View of Cathedral at Moulins sur Allier.

With the glories of Amiens, Paris, Rheims, Rouen and Troyes fresh in his mind, the ordinary visitor will doubtless experience a slight feeling of disappointment on encountering the gloomy grandeur of Autun and Toulouse, Issoire and Le Puy, Tournus and Châlons-sur-Saône. No enormous sheeps of jewelled glass in lofty clerestory or transeptal rose are here, nor spacious procession paths with chapels radiating from them to impart such an air of mystery and indefinite length to the building viewed from its western extremity, but rather such features and details as are appropriate to a country whose climate for a considerable portion of the year obliges its inhabitants to seek speluncar shade.

At Autun, despite the absence of thirteenth-century grace, witness and luminosity, there is something truly awful in the early Pointed sternness of its nave, choir, and crossing, upon the two former of which the Flamboyant epoch has engrafted a series of chapels—good examples of that boldness and lightness sometimes found in combination in this latest phase of Gothic.

Of course, to accommodate these accretions the original plan of Autun Cathedral has been much disturbed, but above the cusped and ogee-canopied arches opening into the southern range of chapels portions of the original Romanesque work—the upper part of the windows—still remain.

One chapel in this aisle has a doorway of singular beauty. Cunningly wrought and brilliantly coloured, its tympanum is charged with a group of the Blessed Virgin attended by angels.

Another doorway exhibiting choice Late Gothic workmanship admits to the sacristies from the south transept. This portal has its ogee canopy richly finialed, crocketed and flanked by pinnacled buttresses, the actual door being obtuse-headed, with the superimposed space between it and the canopy relieved by an elongated rose, Flamboyantly traceried and of great beauty.

Ingres's picture of *The Martyrdom of St. Symphorien at Autun for Refusing to join a Procession in Honour of Cybele* appropriately lends an additional solemnity to that portion of the cathedral graced by the doorway of which I have sketched the salient features.

Classicism is not carried at Autun to the same extent as at Langres, where the pier capitals wholly Corinthianise. Here they are carved more conformably to Gothic models, each in itself forming a study. Not a few are strikingly curious, and it is interesting to find subjects from fabled as well as scriptural story. Two near the western entrance illustrate "Androcles and the Lion," and the "Wolf and the Stork." Of the sacred subjects, that of the "Pelican in her Piety," upon a capital in the eastern limb, is perhaps the most striking.*

Its cumbersome fittings deprive the nave of Autun Cathedral of that spaciousness which forms so pleasing a feature at Langres. A wide Late Gothic arch, foliated and subfoliated, spans the church at its west end and supports the organ. Nave and aisles are closely chaired, as at Tours. The two easternmost bays contain the chorus cantorum, the stalls being backed by screens copied from the arcades in the triforium and filled with glass; a poor sham Gothic pulpit replaces the one from which Talleyrand must have preached; the central tower does

* Among the churches to the south of this boundary line evincing their construction a northern character, the cathedrals of Bordeaux, Nevers, Bourges, Clermont Ferrand, Limoges, portions of Lyons, Narbonne, St. Flour and Mende, and the churches of La Chaise Dieu and St. Maximin, St. Cecile at Albi and that of the Jacobins at Toulouse, deserve mention.

* The study of this cathedral may contribute to mature theories of the highest interest in the principles of Christian art, for during the time that it was in progress the cathedral school of Autun was being presided over by Honorius, by whom a Liturgical Summa, in which are found the boldest ideas of Christian mysticism applied to the construction of basilicas, was composed. The whole sculpture of Autun Cathedral—the portal, nave and aisles—has for its end to trace the pictorial history of the Church's life amid the agitations of earth.

not form a lantern, the presbytery is arranged beneath it, and within the two-bayed eastern limb ; and the high altar with its surrounding furniture bespeaks too plainly the depraved taste of the First Empire.

The northern choir aisle constitutes the lady chapel, where, on the first morning of my visit, a memorial Mass was being said. The celebrant was attended by deacon and sub-deacon, all in vestments of black with silver orphreys. At the conclusion of the Mass a picturesque scene was presented by one of the officiants standing at the foot of the catafalque, processional crucifix in hand, during the aspersing and censing by the celebrant, who assumed a black cope for the function.

About 9 o'clock Terce, Mass and Sext were said by the canons in a Flamboyant chapel opening out of the south choir aisle, the reduced pecuniary resources of the chapter militating against the choral rendering of these offices.

A long country walk had been planned, but the unsettled state of the weather forbade its being carried into execution. However, there was plenty to be seen and to cause diversion in and about the Hôtel des Négociants, whose kind proprietress was all anxiety as to what I would do "pour passer le temps." The hotel was at my disposal, and I was to do exactly as though I were "chez moi." "Would I sit in the bureau or in the petit salon," or "Would I walk in the garden?" In the first-named retreat—déjeuner having concluded—the market folks were constantly in and out, paying their reckonings, exchanging a variety of compliments with Madame, and I fear somewhat seriously interfering with the artistic pursuits of a juvenile who was portraying houses and animals in a primitive and Anglo-Saxon fashion upon paper. Then there was the "petit salon" alluded to by Madame—an elegant apartment with a piano in it, upon which, if musically inclined, you might play tunes ; where mats artfully spread here and there upon the frottéed floor tripped up unwary visitors ; where china dogs and cats "set" to one another on the aforesaid piano ; where, in short, everything was on the most genteel scale imaginable. But the garden, a very charming one—a square plot of ground entered from the courtyard of the hotel—was the best place after all.

Here vegetables and fruit grew in homely propinquity with

> Large dropping poppies and queen hollyhocks,
> With butterflies for crowns—tree peonies
> And pinks and goldilocks.

Above its wall on one side rose the roofs of the Maison Dieu, which when darkness fell was silhouetted with charming effect against a stormy-looking sunset sky.

Thus the day wore on—varied by another visit to the cathedral—until five o'clock, when a dish of tea was prepared and brought to me in the garden by Madame herself. An ideal French lady this, and I hope that, should any of my readers find themselves in this district of Burgundy, they will not fail to make the well-ordered Hôtel des Négociants their headquarters, and themselves agreeable to its affable proprietress.

Thus refreshed, I started forth on a ramble, despite the somewhat threatening aspect of the heavens. Traversing the city in the direction of the railway, I soon arrived at the grand Roman "Porte d'Arroux," already mentioned as having furnished the model for several details in the cathedral. Passing through it, I found myself in a straggling suburb of Autun, consisting of cottages lining the road for a considerable distance. Upon a stall in front of a humble café were spread some fairings, evidently too attractive for a child who was being whipped to bed by its mother to the tune of "When the heart of a man is oppressed with care," which somebody or other was scraping upon a fiddle in the adjacent estaminet. Soon the cottages were left behind, and I emerged upon a road whence a glorious panorama of Burgundian country was spread, bounded in the distance by what seemed to be an interminable chain of hills, which every now and then a gleam of sunshine lit up with an effect almost magical. A modern Romanesque church, situated upon a knoll, challenged inspection. It proved to be a very poor affair indeed, with a roof groined in plaster, which precious material had in places fallen off in great patches, revealing the laths above it.

The nave was aisleless, but there were transepts opening from it, and an apsidal sanctuary. Here a Sister of Char was reverently attending to the wants of the several lam pendant before the altars, which, although tricked out w imagery from the toy-shop, were pleasing from the fact that, lieu of frontal, each had a subject in outline from the Life Our Lord simply incised in the stonework.

The situation of the church was delightful, and from t door of its transept Autun could be seen, including the catl dral, whose crocketed, Lichfield-like central spire was thro into startling relief by the dark hills impending the city j behind it.

Upon these hills I spent the early part of the second day my visit, before starting for Moulins. It was a delightful char from the gloom of the preceding day. The sun shone bright the turf, formed almost exclusively of thyme, was soft a springy ; streamlets of water trickled down in every directi and Autun, spread like a map at the feet, nestled just bel Beyond the Roman gates a sunflooded tract of country bounc by the hills above mentioned combined to form a truly delig ful picture.

Of the hare bells growing in abundance here I was able gather quite a bouquet for Madame, who, upon its presen tion, expressed herself "ravissée," instantly placing the posy a tumbler of water and carrying it in triumph to the salle manger, where it subsequently graced the table at déjeuner.

The railway ride from Autun to Nevers, although exceedingly picturesque and interesting one scenically—lyi as it did through the lovely district of the Morvan—was not all fertile in the study of the provincial character. Indeed, h it not been for a slight ebullition of mirth called forth by t frantic efforts of an old farmer to discern the whereabouts f his railway ticket, which eventually, at my suggestion, turn up in his umbrella, the ride would have passed without incide of any kind.

There was just time, on arriving at Nevers, to get "Sandwich au jambon de York" and a run round t cathedral before I was once more in the train and rushi southwards through the valley of the Allier towards Moulins.

On my return to the railway station at Nevers I had fou its salle d'attente a scene of much animation and bustle, cons quent upon the departure of the pupils from some large lyc which had evidently just broken up. The young gentlem with whom there was a large contingent of papas and mamm uncles, aunts, and cousins by dozens, were oozing away their homes in a genteel and Blimber-like fashion that wo excite the greatest contempt in the mind of an Etoniana Harrovian, or a Marlburian. Two of these young academicia are my compagnons de voyage as far as Moulins. A lady, parasoled and gloved *à merveille*, comes to see tha off, providing them with sweetmeats and some juvenile lite ture, which serve to beguile the tedium of the journey r half an hour or so, at the expiration of which per the juveniles begin to show signs of what I believe technically termed by their elders "the fidgets." A vici forming a portion of their *impedimenta*, is taken from case and a few excruciating noises are produced from interior. Then they proceed to translate the titles of my bo and papers—"Le Neuvième Siècle de Juin, 1894;" "Dus Duval, par W. M. Thackeray," "Manuel des Voyageurs Murray pour la France, Tom. II." and so forth. As approach Moulins the elder of the youths draws from his wa coat pocket a cigarette—a pallid weed that looks as if it d been smoking by itself—eyeing me meanwhile, evidently hopes of my proffering a light. But I do nothing of the kin being no business of mine to encourage the young whipp snapper in his naughtiness the moment he is released from control of his pastors and masters. So, while peering over leaves, observant of all this, I feign to be absorbed in Mr. Pater's elegant essay on Vézelay in the pages of the *Nineteenth Century*. Arriving at Moulins, the carriage door is opened for me by my young compagnon de voyage with as much politeness as the frustrated hope that anticipated a light would permit, and so we part.

The afternoon is intensely hot, and as the train steams into the very imposing station of this little city, the modern twin spires of its cathedral and church of the Sacred Hart rise up white against a cloudless blue sky from the monotonous

plain in which it is located, and through which runs the Allier, shrunken by the dry season to a mere thread, with a large tract of sand intervening between it and the banks.

Moulins is one of the new sees created since the re-establishment in 1801* of religious order in France after the great Revolution. Before 1789 there were eighteen archbishoprics, exclusive of Avignon. Of these, one (Cambrai) was reduced to a simple bishopric, but was subsequently restored to its former higher dignity; four were united with others, viz. Arles and Embrun with Aix; Vienne with Lyons; and Narbonne with Toulouse. The addition of Avignon makes the present number fifteen. Of the suffragan sees some five-and-forty were suppressed, the rest being so arranged that one should be as far as possible coextensive with the department in which it was situated. Among the Northern French sees suppressed in 1801, those of St. Omer, Laon, Noyon, Senlis, Lisieux, Avranches and Auxerre may be named.

When Moulins was made the seat of a bishop, the diocesan had assigned to him as his cathedral the Flamboyant chapel of the Duke of Bourbon's old château. To this inadequate cathedral a nave with western steeples was added (1855-71), in a grand and bold early French Gothic style from the designs of Viollet-le-Duc, who felicitously introduced bands of puce-coloured stone in imitation of those streaks of lava which form so important a feature in the churches of the Auvergnat, notably at Le Puy and in Notre-Dame at Clermont Ferrand.

I was somewhat prepared for disappointment (indeed I only looked upon Moulins as a convenient centre whence to visit the neighbouring abbey of Souvigny), but a few hours in and about its cathedral served to dispel this idea, and I finally left it much impressed with its grace and with the spirit of Mediævalism which has been allowed, contrary to custom, to pervade not only its instrumenta, but which has extended to the vestments of its clergy—ameliorations due to Mgr. de Dreux Brêzé, a prelate of great ecclesiological knowledge and research, and who was called to preside over the see nearly half a century ago.

In the side chapels of the choir, however, the altar-pieces still retain their eighteenth-century character. Poor they are, and utterly wanting that beautiful symbolism which is so characteristic a feature of such works belonging to the Early Renaissance period; still, as a mark of history, they deserve to be spared, and after all do not harmonise ill with the late fourteenth-century Flamboyant work of the choir—a structure exhibiting all the faults of its class, and one not to be named with the magnificent and substantial works which in England were being raised by Wykeham, Chillenden and Thoresby.

My visit to Moulins was paid on August 1, the festival of St. Peter's Chains, when all the altars were vested in white frontals, and the clergy celebrating at them wore flowing, Mediævally-shaped chasubles of the same colour. A little server whom I noticed preceding one of the canons to the sacristy at the conclusion of a low Mass, presented quite a striking combination of colours, for he had on a pink-girdled surplice, a puce-coloured cassock, rather short, revealing a considerable interval of grey trouser and not overclean white stocking, and the débris of a pair of yellow sand-shoes.

The high altar in the cathedral at Moulins stands at the top of the few steps just beneath the arch opening into the choir. It is a double one, with frontals facing east and west, the same "ornaments" of course serving for either side. Over this is reared a magnificent Gothic baldacchino of brass, having a cusped arch beneath a gable on each side, and a spiral roof of elegantly wrought work. Behind it is the chorus cantorum, and in the chord of the three-sided apse is placed the episcopal throne, which, with its overhanging canopy of brass, is, as well as the baldacchino, a good example of revived Mediæval work in that material. There is a considerable quantity of Late Gothic painted glass in the aisles and also in the procession path, which, singularly enough, does not follow the line of the three-sided apse, but has a perfectly straight eastern wall* pierced with large Flamboyant windows, and presenting externally at its north-east corner a pretty "bit" in the shape of a square-headed doorway, above which, and incorporated with it, is an elongated-headed window of two lights Flamboyantly traceried. This is the door by which the cathedral should for the first time be entered, for the sake of the picturesque cross views embracing the fourteenth-century choir with its old painted glass and gorgeous baldacchino, and the nave with its severe First Pointed arcade and clerestory—the latter reminiscent of Chartres. There are no transepts, but upon the western point of the choir roof, which rises a few feet above that of the nave, a small flèche is placed, masking in some degree the disparity in the two heights. Moulins presents another good example of the Gothic revival in France in the shape of the church of the Sacred Heart—a truly noble specimen of the genius of M. Lassus, between whom and our Ecclesiological Society a friendly intercourse was long kept up. With the object, apparently, of getting the main front with its two spires to "give" on to the Place, orientation has been disregarded. This rule, so rightly adhered to with us, unless set aside by some cogent reason, even in the laxest times of church discipline, is by no means so strictly followed in France. Mr. Fergusson rejoices in this fact. "Fortunately," he says, "for their architectural designs the French have not the same superstition with regard to orientation as the English. Many of our best modern churches are ruined by being turned the wrong way."

The church of the Sacré Cœur at Moulins is, like that of Sainte Clothilde at Paris, a miniature cathedral—comprising nave with double aisles and western steeples, transepts and choir, with procession path and radiating chapels; yet neither of these churches has that solidity, nor can they ever wear that "air of eld" which our English architects have, in their more humbly dimensioned buildings, so often and so successfully attained. But the interior of the Sacré Cœur at Moulins, as I remarked above, is wonderfully minsterlike and impressive, and the views across the nave—whose piers, by the way, are gathered up into very harmonious clusters—from the large unchained space at its western extremity have considerable poetry. There is no painted glass in the nave clerestory. Here the windows are of that very early French type we see at Chartres. Those in the eastern (really western) clerestory of either transept and choir, as well as those in the tall thickly-set lancets of the apse—for which Chartres has evidently again furnished the model—have all received their complement from the atelier of Lorin. The general effect is rich and good, but the introduction into the clerestory windows of the south transept of figures of Louis XVI. and Marie Antoinette, Napoleon III. and the Empress Eugénie, sufficiently indicates the utter incongruity of the costume of the last and present centuries for ecclesiastical decoration. The finest figures are those of the Apostles and Doctors in the choir clerestory—they are truly superb; finer, I think, than those very striking ones in the choir of Notre-Dame at Paris.

(To be continued.)

* The restoration of a National Church establishment in France is announced with becoming solemnity by a grand ceremonial at Notre-Dame on Easter Day, April 18, 1802, attended by the three Consuls, the diplomatic body, the Cardinal-Legate, the new archbishops and bishops, and a numerous cortège of civil and military authorities.

* I observed this same arrangement of the procession path in other churches of this part of France—notably at Clamécy, an Early Pointed example. Evidently it is a localism.

BROCKENHURST AND BOLDRE.

THE members of the Hampshire Field Club recently visited Brockenhurst and Boldre in the New Forest. The party, according to the *Hampshire Advertiser*, first proceeded to Brockenhurst Church, and as they walked around it Mr. Shore said the characteristic features of the building were seen better outside than inside. The chancel was a very good illustration of thirteenth-century work, and so was the east window, which had been restored in places; but much of the old work remained. The east wall was interesting from a geological point of view, for they would notice in it blocks of the iron-stone of the New Forest district, now so scarce, quarried in olden time and put into the building by Norman and Early English workers. The orientation of the church was east-north-east, allowing 20 degs. for magnetic variation. The north chancel window was well preserved. The ruined tree near the gate was an oak, which was very old, because it

had not only had time to grow, but time to decay, and an oak tree he was told took as long to decay as it did to grow. The yew tree before them was not so old as the oak; it was probably 600 years old, but there were many older in Hampshire. Under the shade of this tree Mr. Shore then read a few notes on Brockenhurst Manor.

Domesday entry states there were only six borderers and four slaves on the manor. This shows that it was a small manor without any large village community attached to it. Being in the forest its surrounding land was all under forest government, and that in Norman time was different from the common law of the county. The sheriff had no jurisdiction. The rigour of the forest law must have been felt in all its severity here. The village has on several sides of it extensive lawns or forest pastures. These pastures and the right of the inhabitants to their use dates further back than the Norman Conquest. The common privileges of the New Forest can be traced by incidental reference to Saxon times. "Domesday Book" shows us in detail how the New Forest was formed, and the entries concerning it do not confirm the legendary accounts which originated in the guesses of later historians. In all the digging which has gone on in the New Forest for planting or for obtaining gravel or marl, no foundations of ancient churches, such as have been stated by some Mediæval chroniclers were destroyed, have ever been found. It is scarcely possible such churches could have existed without some traces of them coming to light in the course of centuries, and the parts of the forest where they would have existed would have been the most fertile parts, which are those where most digging and excavations have been made. Brockenhurst Church itself, however, contains Norman work, and consequently there can be no doubt about a church having existed on this spot in Norman times. According to the account of a Norman-French writer or poet, Brockenhurst was incidentally connected with the death of King Rufus. His account says he was passing through this place on the morning of the day he was killed, when a local smith approached and offered the king some arrows of his own manufacture. The king accepted the gift, and the account says the arrows were passed on to Walter Tyrrell, and that it is not improbable that one of them later in the day caused the king's death. This church shows by its remains that it must have had liberal benefactors in the Norman and Early English periods. Its orientation points to a church of the Saxon period. In no case in Hampshire had he met with a church with an east-north-east orientation which was built in Norman times. The Norman churches are nearly always placed east and west, but not E.N.E. Where Norman work exists in such churches it points to the line of an older building. Entering the church Mr. Shore pointed out that a recess in the south wall of the chancel was thought by some to be an Easter sepulchre, but he could scarcely take that view himself. He pointed out that the stone chancel arch had been covered with plaster in recent restorations.

The Rev. F. Bowden-Smith said the stone arch had not been covered within the memory of man. He added that the enlargement on the north side was effected in 1832 or 1833 by the removal of the north wall. The work, he said, was done by the village carpenter.

Mr. Shore called attention to the royal arms over the chancel arch. These were of the time of George I.—1719. Few Hampshire churches had any royal arms that were older. A few had Queen Anne's arms, and still fewer the arms of Elizabeth. He should be very sorry to see these royal arms abolished in churches.

The Rev. Bowden-Smith said there was a royal arms on the other side of the arch, the date of which he should like determined. The ancient font—similar to that at Barton-Stacey—which has been treated by modern hands, was inspected. The church has three bells, the smallest of which has no inscription.

The party then walked to Boldre, about 2½ miles distant, and were received at the church gate by the Rev. E. H. Elers, vicar of the parish. Inside the edifice Mr. Moens, F.S.A., a member of the club, read a history of the church, of which he said no mention was made in Domesday Book. The church was probably built between the time of a grant made by King Henry I. to Richard de Redvers in 1100, and the king's death in 1109. It was dedicated to St. John. He dwelt on its connection with Christchurch Twyneham, and Brockenhurst and Lymington, and pointed out the leading architectural features, the south aisle being separated from the nave by Norman arches on stone shafts; the northern arches being Pointed and supported on Purbeck marble columns. This part was probably built in the time of Henry III., though "Warner" gave the time as that of King John. Mr. Moens alluded with regret to the removal from windows he pointed out of some of the most ancient stained-glass in the kingdom. Boldre Church was subject to Christchurch till the Dissolution. He had, he continued, a list of vicars since 1382, with only a gap or two which might be filled up without difficulty, and said one of the most celebrated was the Rev. William Gilpin, M.A., who was instituted in 1777, and in 1791 publish his "Forest Scenery," which ran through four editions. H also wrote other books. He died on April 5, 1804. His wi died in 1807. He left funds which were devoted to scho building. His tomb was in the churchyard, and the inscriptio was as follows:—"In the quiet mansion beneath this ston secured from the afflictions, and still more dangerous enjo ments of life, lye the remains of William Gilpin, sometim vicar of this parish, together with the remains of Margaret, h wife. After living above fifty years in happy union they ho to be raised in God's due time, through the atonement of t blessed Redeemer for their repented transgressions, to a sta of joyful immortality. There it will be a new joy to me several of their good neighbours who lye scattered in the sacred precincts around them" He died April 5, 1804, at t age of 80; she died July 14, 1807, at the age of 72.

This inscription Mr. Gilpin wrote in readiness for his ov departure. "A visit to the tomb of Gilpin," Mr. Moens co cluded, "is the duty of all literary men who visit this locality In Boldre Church Southey was married to his second wi Caroline Bowles.

The Rev. G. W. Minns proposed a vote of thanks to M Moens for the information he had given, and expressed a ho that he would enlarge it into a paper for publication in the cl proceedings. He added that Mr. Gilpin was supposed to l the original of Dr. Syntax, "a simple-minded clergyman, excellent taste and scholarship, who left home in search of t picturesque." His adventures were told by William Cooml in verse, published with some humorous sketches in 181 His horse was called Grizzle.

Mr. Moens, whose remarks had been supplemented wi some ancient pictures of the church interior lent him for t occasion by the Earl of Northbrook, president of the clu mentioned in reply that forty histories of English counties we to be published, and the history of Hampshire was to be t first. It would be in four volumes of 500 pages each. M Doubleday was to be editor, and several others, including M Shore, were to assist. He hoped any one who possesse papers relating to the county would send the particulars. county advisory committee was about to be appointed in t matter, with the Earl of Northbrook as chairman and M Shore as secretary.

The visitors then quitted the church to inspect Gilpin tomb, over which the Rev. J. E. Kelsall, of Milton, readin from a printed list he had prepared on "Our summer migrant when to inspect them and how to recognise them," gave som interesting details of forest birds, for which he was thanke The party then returned to Brockenhurst.

THE ART UNION OF LONDON.

At the annual meeting of the Art Union of London held April 27 in the lecture hall of the Society of Arts, t Marquis of Lothian, as president, in moving the adoption the report, expressed regret that there had been some fallin off in their numbers, and attributed it in a large measure to t many facilities which now existed for obtaining drawings do by cheap mechanical processes. He said that with so ma competitive means of obtaining works of art it was natur enough that the number of those who belonged to the Socie should divide and tail off in different ways. But there w a good deal of misunderstanding among the public as what the objects of the Society really were. It was not commercial undertaking, nor was it a society for floodi houses with cheap works of art. The object was to jud in what direction the tastes of the public lay and to fos that taste, and to lead it into the best possible chann by producing for the members, or giving as prizes, the b possible works. The amount which had been spent by t Society since the beginning in prizes and works of art was less than 487,000*l*. The money had been expended by t Society in a way which had been of the greatest possi advantage to the public. He thought it was not too much say that if it had not been for the Society the beautiful art f line engraving would have disappeared many years earlier. was now trying to encourage another beautiful art, that etching. One of the great difficulties of the Council had bn to know exactly what style of work of art would best meet e wishes and artistic taste of the members of the Society. Te public taste seemed now to lie in the direction of landsca which was not surprising in these days when so many peo e lived in large towns.

Turning to general topics, he said there were several n public works being commenced in London which called r attention. There were the new Vauxhall Bridge, the n buildings in Parliament Street and the new War Office bui ings in Whitehall. All these things now seemed to him to e done without any Parliamentary or popular control. Te public had no opportunity at all, so far as he could see, f saying one word about them until they were finished. e

hought it would be an immense advantage if some control ere exercised by an expert Parliamentary committee or in ome other way, and all the details of the proposals were sub-nitted for public inspection, or at any rate for expert opinion, efore it was too late. Mr. Woodward had called attention to he subject in the *Times* of that morning. He dealt particularly with the railway station near St. John's Wood, and if his escription of it was true it was not likely to add very much to he beauty or amenity of that part of London.

Then there was the question of the decoration of St. Paul's Cathedral. He had had some means of knowing what was oing on with regard to that great work, and he was very lad that public interest had at last been aroused by criticism n the press and in other ways. The building had a splendid ignity in itself, and they were all deeply concerned that othing should be done to derogate in any way from its ppearance, either inside or outside. The question resolved self principally into two matters—one was that of the use f mosaics, and the other that of the decoration of the stone-ork. It had been said that the mosaics were of a Byzantine haracter, and were therefore not suitable to a building f the architectural character of St. Paul's. With that iew he entirely disagreed. The art of mosaic decoration was ssentially a Byzantine art. The art of decorating in mosaic as necessarily cramped and circumscribed by the material hich was used for it, but in itself it was essentially rnamental and dignified. He was not one of those purists ho objected to anything, however beautiful and satisfactory n itself, being used in a building which was not of the same ate as the art decoration which was placed in it. If it were ranted that it was right, in accordance with Wren's original ntention, that the small domes should be filled with mosaics, e could conceive of no better way of doing it than the way n which it had been done now. It was true that the design n the first dome treated was somewhat small, but it was mpossible to judge of the effect from below until the caffolding had been removed, and this defect had been emedied in the proportion of the designs for the other small omes. The other question was that of the treatment of the onework. He thought it must be obvious to everyone that if he small domes had been filled with mosaics, and all the onework around them had been left untouched, the work ould have appeared very patchy, and anything but effec-ve from below. Undoubtedly Wren had contemplated some ecoration; but there was a medium in all things, and he ould not help thinking that too much colouring of the onework had been made use of in the decoration. If the onework was to be entirely covered with paint and gilding, here might, for aught one could tell, be only iron girders nd plaster beneath, and much of the dignity and impressive-ess and sense of space which the massive stonework gave the building would be lost. He was afraid that it was ow too late to rectify some of that which had been done; but e trusted that in the future there would be less gilding and ss colouring used. As to the stencilling on the arches, he ould only say that the pattern was only suitable for embroidery, nt it would be removed. The decoration committee which ad been appointed by the Dean would give careful attention the subject, and he hoped that the decoration might yet be ompleted in a manner which would give rise to no further omplaints.

Mr. Sebastian seconded the motion, and the report was dopted.

THE ARCHITECTURAL ASSOCIATION.

THE concluding meeting of the session of the Association was held on May 12, at 9 Conduit Street, W., Mr. G. H. ellowes Prynne, president, in the chair.

It was announced that the first summer visit, which will be Cobham Hall, Kent, was arranged for June 3.

Votes of thanks were passed to Messrs. G. H. Fellowes-rynne and F. A. Walters for conducting visitors over urches at Ealing on April 29, and to Mr. E. R. Barrow for s hospitality on that occasion. Also to Mr. H. Greville ontgomery for arranging visit to the Building Trades xhibition on May 6, and for providing refreshment.

The following were elected members:—Messrs. W. H. aines, Bowes H. MacGowan, J. Farraday, W. H. Lovegrove, . A. Peache and W. J. Windrum.

Dr. G. V. Poore, M.D., read the following paper on

Aspect and Soil in Relation to the Dwelling-house.

Although I have presumed to accept the invitation of the rchitectural Association to read a paper, I hope I shall be quitted of any desire to step outside my province and to cture architects on matters which they obviously understand uch better than I.

My excuse for addressing you must be found in the fact at, as a physician and sanitarian, I believe that of all circumstances which make for or against the health of the public, the individual dwelling-house is most important.

The conditions under which dwelling-houses are built have been revolutionised by steam machinery. Houses are nowadays run up in a wholesale fashion, very often with little attention to the details which he would dwell upon to-night. Modern facilities as regards water supply and sewerage have made curtilage unnecessary, and have enabled us to build towers of flats which, from the sanitarian's point of view, are most undesirable.

We all recognise that overcrowding is the greatest of social evils, whether it be regarded from the point of view of morals or health, and we all protest that it is useless to attempt to check it. Most of us, I hope, are sensible of the magic influence of the word "home." Many of us believe that the "home" and the "family" are the units out of which the greatness of a nation is constructed, and that if a nation is to continue to be imbued with feelings of true patriotism, the sacredness of the home and the sentiment of family must be maintained. I wonder if the offspring of parents who fluctuates between Capel Court and Newmarket, and whose only dwellings are West-End flats on a three-years' agreement, and rooms in hotels at fashionable resorts, has any home sentiments? Would these sentiments be increased if his fashionable mother died of constructive murder in getting quit of that which might have been a brother or sister? and lastly, can any such sentiment persist if papa and mamma are finally poked into a fashionable crematorium?

It is very doubtful if the sentiments of home and family are likely to be strengthened by the mode of life of what are known as "smart" people.

The opinion has lately been expressed by a great authority on labour questions that the industrial classes do not want "homes," and that anything which tends to fix them in one spot or to create an affection for any locality is contrary to their best interests. Labour must be organised as an army, and quick mobilisation is essential if the fight with "capital" is to be successful. There can be no doubt that public opinion is at present mainly in favour of overcrowding in cities, and further, there can be no doubt that overcrowding is encouraged both directly and indirectly by modern municipalism and the by-laws which regulate building operations.

Very little attention is paid in the present day to the aspect of a house, and it is evident that the public barely consider the question of aspect.

The speculative builder considers the question of cost and cost only, and until the public recognise that aspect has a real money value and is worth paying for, there is no likelihood that the question of aspect will trouble the mind of the builder.

It appears to me that the engineer and the surveyor have too much the "whip hand" of the architect, and that by the time the building estate has been laid out the whole question of aspect has been practically settled, and the architect has really no choice in the matter.

In the Thames valley, where I have a cottage, I have for the past twelve years watched the "development" (so-called) and the wholesale urbanising of a rural spot. This process is a simple one, and is familiar to all of you.

1. The locality is constituted an "urban district."
2. The Council is elected for three years.
3. The Council immediately borrows a sum which works out to about 10,000*l.* for each councillor, and thus increases all existing rents for thirty years at least.
4. The roads (main roads and by-roads) are all provided with sewers and water-pipes.
5. The lands abutting on these roads suddenly change from farms and gardens to building sites.
6. These lands are bought by building societies or building speculators, and are laid out with one object, and one only, in view, *i.e.* the placing thereupon of the maximum number of houses which is permitted by the by-laws. This means that no house has any curtilage other than a backyard 25 feet deep.

In "laying out" a building estate the new roads are almost invariably at right angles to or are parallel to existing roads, and it is needless to say that they are absolutely straight. Curves of beauty are scarcely permissible in modern sanitation. The result of all this is that the building estate when complete has all the regularity and symmetry of a gridiron. The houses are possibly all built to pattern. There is no individuality, no variety, no change, no rest for the eye.

The extent to which this kind of thing is carried is well exemplified in the district to which I have alluded, in which there is a "recreation ground" dating from a time anterior to the sewering and urbanising.

This recreation-ground is five acres in extent, and its northern and southern boundaries are formed by high roads, while its eastern and western boundaries are formed by market gardens, which, in consequence of the changes indicated above, have suddenly developed into building estates. One would have thought that the building speculator would have turned the fronts of his houses to overlook the recreation-ground, and

that by giving his houses (as he might have done) a south-easterly aspect with the pleasant prospect of the recreation-ground he might have commanded some extra rent.

This does not appear to be the case, for the privies and washhouses have been turned to the recreation-ground, while the chief rooms of the houses look at their stuccoed twins on the other side of the street.

The recreation-ground will, I suppose, remain a rather gaunt spot, hedged in by prim railings and flanked by lines of fluttering linen. The opportunity of making a pretty "village green" has been allowed to slip, and I am not aware that the Urban District Council have troubled their heads about the question.

If we are to continue to build houses in a wholesale fashion in straight rows it is almost useless to appeal to the architect on the question of aspect, although some good might be done by directing the attention of engineers and surveyors to the

If we concede that the best aspect for the chief rooms of a house is one looking to the south-east, then it is obvious that if the main roads of a building estate run from south-west to north-east, the houses flanking such road would have one side turned to the south-east. On the north side of the road the fronts would face the south-east, and on the south side the backs would face the south-east, unless the local council permitted and the builder were willing to allow the backs of the houses on the southern side of the road to be turned to the street. Speaking as a doctor, I have no doubt that it would be advisable to turn the backs to the street, if by so doing a good aspect can be obtained for the chief rooms. By adopting this plan we have the additional advantage of bringing the culinary and sanitary arrangements close to the street, and thereby greatly simplifying the sewerage arrangements, which would result in some saving of money. It is very important from the point of view of health that food should be stored in a cool place. Sour milk and putrid food is a great cause of infantile diarrhœa. This is an additional reason for the rule of "living rooms to the sun, larders and kitchens to the north."

I need not remind this Association that some of the finest houses in London (Hyde Park Gardens) are built with their "backs" to the street, and with the main rooms overlooking a private garden with the Park beyond. Whether houses with their backs to the street would meet with the approval of "the masses," I cannot say. A stuccoed head over the front door probably does more to let this class of house than the fact of its rooms being exposed to the sun. If it were considered essential that the chief rooms of a house should face the south-east, there could be no difficulty in attaining this end (except in streets running from north-west to south-east), provided the houses were placed obliquely to the street line and were built *en échelon*, a mode of building which tends to secure privacy, although it probably adds to the expense of building and the difficulties of plotting out the estate.

It is evident that the laying out of the roads on a building estate is a most important matter in relation to the aspect which the houses are to enjoy. Is it necessary that all such roads should be absolutely straight and at right angles to each other? Is it quite impossible to rest the eye and give some variety by an occasional curve? Is it any use to appeal to the ogre jerry-builder on a purely æsthetic question?

The question of aspect is very much a question of sunlight, and there can be no doubt that sunlight has great influence on health. The Italians have a proverb which says, "Dove non va il sole va il medico"—that the doctor comes to those places which the sun does not visit. It is an established fact that many of the microbes which are the causes of disease are killed by sunlight. This appears to be the case with regard to tuberculosis, and it is certain that there is most tuberculosis in places which are overcrowded, and to which the sun finds access with difficulty.

In the supplement to the fifty-fifth annual report of the Registrar-General is a table giving the annual death-rate per million living among children under five years of age from tuberculosis in the ten years 1881-90.

By selecting the death-rate among children under five we practically exclude the disturbing influences of varied age, sex and occupation, and we may conclude that amongst this class the influences which make for health or the reverse are home influences. Again, when a man selects a house, no single consideration is of more importance than the effect which his dwelling is likely to have upon his children. This table of the Registrar-General's is therefore one which ought to be carefully studied, and as it deals with a period of ten years it may be concluded that the statistical results arrived at are reliable.

Among children under five there is more tubercular disease in London than in any other county, and probably for the reason that the number of persons on a given area is greater in London than in any other county.

Thus the death-rates from tuberculosis are in :—

London	6,581
Durham	5,650
Lancashire	5,364
Dorsetshire	2,401

Again, when we come to examine the death rates fro tuberculosis in the different registration districts of London, w find them as follows :—

Strand	11,881
Stepney	9,310
City	8,858
Chelsea	8,129
St. George's, Hanover Square	7,952
St. Saviour's	7,839
Holborn	7,876
Westminster	7,766
Shoreditch	7,675
Poplar	7,219
St. George, E.	7,204
St. Pancras	7,064
St. Giles	7,055
Marylebone	6,920
Bethnal Green	6,988
Fulham	6,731
Kensington	6,571
Islington	6,532
Whitechapel	6,098
Paddington	6,029
Hackney	5,989
Mile End	5,975
St. Olave	5,910
Lambeth	5,907
Woolwich	5,641
Wandsworth	5,581
Camberwell	5,537
Greenwich	5,528
ENGLAND AS A WHOLE	4,499
Lewisham	4,018
Hampstead	3,661

It is a remarkable fact that in only two of the registrati districts in London is the death-rate of children from tube culosis less than it is in England as a whole. In all the oth districts the death-rate from the tubercular diseases is muc higher than in the country at large. Possibly some of the figur are influenced by the position of hospitals, but not to any gre extent. Seeing that tubercular diseases are all chronic, ar that many children are moved out of London at the fir threatening, I am afraid it is impossible to conclude that th figures give an exaggerated idea as to the extent to which th malady prevails in this dark, overgrown town.

This prevalence of tuberculosis is due to overcrowding houses on the land and overcrowding of people in the house to the dirt-laden air and the darkness and the gloom.

In London it is almost idle to talk of aspect. If aspect mainly a question of sunlight, then in London it is not on necessary to have your house facing towards the sun, but al to make sure that no screen in the shape of a tower of fla intervenes between it and the sun. To discuss the question almost absurd. If what I have said, and the figures I ha quoted, are sufficient to convince you and others that the co ditions which pertain in London are to be avoided in le crowded places, a good work has been done. To have yo house facing the sun, and with its chief living rooms w exposed to it, means a considerable saving of fuel and gas. am unable to tell you what is the potential value of the he in a room facing the south over and above that of a roo facing north, but we must all feel sure that it is considerable. am fond of telling people to look at the north and south sid of a garden wall. Go to the south side and bask in t brightness and warmth, feast on the peaches ripe and rud and listen to the hum of insects glinting in the sunbear. Then go to the north side, damp all in chilling shadow, contr you with a few hard pears or acid cherries, scrape off the dan mildew growing in the mortar and sniff the fusty smell arisi from the dank sour soil.

It is idle to contend that aspect has not a most import influence on health. If a house face right and has a veranc the occupants can often enjoy the fresh air, instead of crowdg into a stuffy room.

If a dwelling be detached and isolated it is generally pi sible to give the chief rooms any aspect which may be desir It is common to find, however, that detached villas have th fronts parallel to the road, even though this position shod entail a north-east aspect. How far by-laws and regulati may be answerable for this state of things I do not know.

Not only on account of the freedom as regards aspect, it on the general ground that overcrowding is to be lessened by every means in our power, it seems to me that sanitary auth i-ties should encourage the erection of detached and isola d dwellings.

The most important part about a "home" is not the hou but the garden round it, and I have no hesitation in saying tat the children of a country labourer, born in the commonest d cheapest erection of wood or mud and thatch, standing int rood of potato-ground, have a much better chance of growg up healthy in body and mind than those who have been bn under the fostering care of urban district councils in hou

with concrete foundations, damp-proof walls, patent water-closets and traps, sewer pipes and rain-water pipes, with an expensive paving in front and a tiny concreted yard behind, which is practically an air-well with putrification traps in its floor. This last class of dwelling, be it remembered, the outcome of by-laws which seem to be designed for the purpose of rapidly urbanising rural places, is very expensive, and the artisan finds that he has to pay relatively an enormous part of his earnings in rent and rates, and that his children have no private playground.

I freely admit that the stringent building by-laws which are now in force in many places are very necessary in crowded centres of population; and if they were still more strict on the question of height and the relation to be enforced between the cubic contents of the building and its surroundings, I for one should not object. On the other hand, it must be remembered that these by-laws very much augment the cost of building, and that it is becoming increasingly difficult to get an adequate return for houses erected for the wage-earning class. So much is this the case that it seems not unlikely that municipalities will be called upon to provide dwellings and run them at the expense of the ratepayers as a whole.

Many rural municipalities have adopted these by-laws and appear to me to enforce them very often to the detriment rather than the advantage of the locality. A little town in Hampshire, which I know well, includes within its official boundaries places which are three or four miles from the town hall, places which are in the wilds and as thinly populated as Sahara. And yet this municipality enforces its by-laws so that the farmers and gentry of these outlying spots are obliged to submit plans of even outhouses or ovens which they are proposing to erect, to the collection of tradesmen who happen to constitute the Council for the time being.

I am very strongly of opinion that the builder of an isolated dwelling ought to be allowed to escape from these harassing by-laws, and ought to be permitted greater freedom in the choice of building materials and in other matters than the speculator who is trying his hardest to put the maximum population on the minimum legal area. In relation to fire and infectious disease the surest preventive measure is the isolation of the dwelling. If the dwelling be separated from the boundaries of other premises and the public thoroughfare by a distance equal to its height (*i.e.* the distance from the ground to the top of the highest chimney or gable) it ought to be allowed to escape from the by-laws. I need hardly say that the insurance offices will know how to enforce an adequate security against fire. Mr. Till, of Eynsford, in Kent, recently erected two timber cottages in the country on either side of a road. One of these cottages was condemned because it happened to be within the boundary of a council which had adopted model by-laws. The only valid reason for such condemnation was the danger of fire. But it is evident that the danger of loss of *life* from fire is very slight in an isolated cottage with the bedroom windows some 10 feet at most above the ground. On the other hand, the danger to loss of property is indicated by the fact that the insurance offices charge 2*s.* 6*d.* per cent. instead of 1*s.* 6*d.* If, however, a model by-law cottage costs 250*l.* while a wooden cottage equally large and wholesome costs 150*l.*, it is evident that the cost of insurance is equal in the two cases. The rent of the first at 5 per cent. would be 12*l.* 10*s.*, and the rent of the second 7*l.* 10*s.* If the local charges (rates) be 4*s.* in the pound, then we have as the annual cost of these two cottages :—

Model By-law Cottage.	£	s.	d.
Rent	12	10	0
Rates	2	10	0
Insurance		3	9
Total	15	3	9

Wooden Cottage.	£	s.	d.
Rent	7	10	0
Rates	1	10	0
Insurance		3	9
Total	9	3	9

By living in a wooden cottage the working man would save 6*l.* year, or nearly 2*s.* 4*d.* a week. And if he have a rood of round the produce will be worth at least 12*l.*, which will leave im with nearly 3*l.* in pocket after paying all charges on his ouse. Further, he will have made an intelligent use of his eisure instead of consecrating it all to beer and betting.

I need hardly say that even the isolated cottage must be nder control as regards cesspools or any underground sanitary bominations, which may be an unseen danger to the neighours, but I am very strongly of opinion that, on the grounds f the health and safety of the public, builders of isolated wellings ought not to be harassed by by-laws, which are in heir case merely a source of delay and increased expense.

I should be very happy if my remarks on this head should licit a decided expression of opinion from an influential society uch as I have the honour of addressing.

In these days of railways, trams, motor cars, telegraphs, elephones and bicycles—machines which have practically nultiplied time and to a great extent annihilated space—it ught to be possible for populations to spread out and to live more decently and wholesomely than is the case in crowded cities.

It ought to be possible to build detached houses in increasing numbers, and as a consequence to give to the chief rooms of the house any aspect which may be desired.

The question of soil in relation to the dwelling is necessarily one of great importance.

Assuming, in the first instance, that the soil selected is a pure soil, I may as well say that I have no evidence to bring before you that in the matter of wholesomeness there is any difference between rocks, sand, gravel or chalk, and I am not aware that there is any evidence that either of these soils gives rise to unwholesome emanations.

The interstices of all porous soils are filled with air and a certain excess of carbonic acid, which may be considerable if there be much organic matter in the soil, and a house with lighted fires necessarily tends to aspirate the gases from the earth upon which it is built. Now I am not aware that there is any real evidence to show that damage has ever resulted to persons from the gases emanating from a pure soil.

In cities where organic filth has been buried in the soil for ages, it seems likely that the gases of putrefaction may gain access to the house. In London we know that when the soil is opened up there is always a stink of illuminating gas, and, obviously, it is desirable to keep that out of our dwellings. Further, we know that impurities from sewers and cesspools are sure, under the existing order of things, to leak into the soils of populous places. Therefore, the model by-laws insist that the ground upon which a house is built shall be covered with a regulation thickness of concrete. This is a reasonable provision in a populous place, but I would remark that, so soon as a crack or pinhole is accidentally made in the concrete, the alleged security given by it vanishes. In country places which have adopted the model by-laws, the covering of pure chalk or sand or gravel with concrete is equally insisted upon before a cottage can be built. This has the effect of increasing the cost and rent of the cottage, unless it be thought advisable to make the floor of concrete finished with cement. It goes without saying that for houses built in low-lying damp situations, an impermeable layer of concrete is necessary. The above remarks are intended to apply to concrete as a barrier against the gases in dry soils.

The soil upon which a house is built influences the comfort, and therefore the health, of the indwellers. On a dry soil it is possible to take exercise in comfort, while on stiff clay soils walking or any other exercise in the winter months is a disagreeable and dirty proceeding. It is quite possible to build a house upon clay which shall be perfectly dry, and through clay unwholesome gases find it difficult to travel, which is a theoretical advantage. Fogs are frequent on clay lands, but it is not clear that an occasional pure fog does any harm to a healthy person. I say nothing of the foul irritating fogs of London, which are dangerous to many and deadly to not a few.

The nature of the soil upon which a house is built has great influence on the ease with which the waste drainage waters are got rid of. On porous soils—such as sand, gravel and many chalks—they soak away, and hence there has been a great temptation on such soils to construct soak-away cesspools, which in the days of our ancestors, before the use of water-closets and fixed baths, or even daily "tubs" became general, were little likely to contain infective matter, and continued to act efficiently for years. Modern sanitation has raised the amount of waste water enormously, and the invention of the water-closet has greatly increased the danger and foulness of the waste waters. It is probable that the amount of sewage to be dealt with in country houses has, in modern times, as compared with the last century, been multiplied by ten, and it is now quite common for the owner of a biggish country house with stables to have to grapple with 1,000 gallons of sewage per diem, or 160 cubic feet, an amount which will stand about an inch high on an area measuring 50 feet in length and 40 feet wide, or which in a month will fill a water-tight cesspool measuring 24 feet by 20 feet and 10 feet deep, the dimensions of a fine dining-room, and which when full will contain more than 130 tons of foul liquid, which will all have to be raised and distributed. On a porous soil such an amount of fluid, if delivered on the surface of the ground, may be got rid of with ease and without offence if the few pounds weight of excreta (12 pounds at the outside) of the twenty-five people living in one country house be dealt with separately.

On a clay soil, especially in winter, a very much larger area of ground must be used for the waste water.

The foulness of the river Brent, of which we have heard so much, is probably due to the fact that the foul liquids on the clay soil through which it flows tend to run off the surface instead of percolating through the soil and thereby becoming purified.

I must not pursue this subject further, as it is not my intention to discuss the question of slop-drainage and sewage

treatment, which I have dealt with at length in my little book "The Dwelling-house." I will merely add that whether a house be on a permeable or impermeable soil—

1. All waste fluids should be dealt with before putrefaction sets in.

2. They should be delivered on to the surface and not beneath the surface of the ground.

3. They should never be allowed to collect in cesspools, which encourage putrefaction, and merely postpone the inevitable work of distributing them over the ground.

The following officers have been elected for the year 1899–1900 :—

President.—G. H. Fellowes Prynne. *Vice Presidents.*—E. Howley Sim, H. T. Hare.

Committee.—B. Pite, W. A. Pite, P. J. Marvin, A. H. Hart, F. G. F. Hooper, H. A. Satchell, M. Garbutt, W. A. Forsyth, W. H. Seth-Smith, A. Bolton.

Hon. Treasurer.—Hampden W. Pratt.

Hon. Librarian.—A. S. Flower.

Hon. Secretaries.—G. B. Carvill, R. S. Balfour.

The above form the committee.

Hon. Solicitor.—W. H. Jamieson.

Hon. Assistant Librarian.—W. B. Dukes.

Hon. Auditors.—J. W. Stonhold, W. E. Davis.

Assistant Secretary and Registrar.—D. G. Driver.

BERKSHIRE ARCHÆOLOGICAL SOCIETY.

AT the annual meeting of this Society the president, Mr. C. E. Keyser, of Aldermaston Court, read a highly interesting paper on "Norman Doorways of Berkshire Churches." Mr. Keyser opened his remarks by observing that as the object of the Society was to make known to those who resided in the county the objects of interest in it, he did not think it was a bad thing to begin with what might be called a narrow subject, in order that they might see the very interesting examples of that particular subject which they possessed in the county. When he first took an interest in Norman architecture, and in Norman doorways particularly, he was told that it was a subject of very limited interest, because doorways were all exactly alike. But it was most unusual to find any two Norman doorways which exactly corresponded, and the only two such which they had in Berkshire were the north and south doorways of Buckland Church, near Faringdon, which were among the earliest of all the doorways still existing in the county. The doorways in Oxfordshire were more numerous, and were more interesting on the whole than those in Berkshire. He believed that there were four periods of Norman architecture. He did not suggest that because they found an ornate doorway it must be a late one, or that if they had a plain one it must be an early one; they had to look at the details and the various mouldings, but the finest doorways usually belonged to the early portion of the third period. Though the Norman Conquest took place in 1066, the Norman style did not make headway or was not generally adopted till about the year 1080; then they had the Norman style coming in—very plain as a rule. The examples at Buckland were very fair specimens of what the plain early Norman doorways were like. That style lasted—of course their cathedrals were more ornate—till 1130, about the time of Stephen, and strange to say it was during his troublous reign that some of their finest Norman buildings were erected. The third period lasted from 1130 till 1170, and then came in what they called the Transitional style, which lasted well into the Early English period, into which it overlapped. There were doorways in this country which might be as late as 1220, which either retained their "semicircular head," or which still had the characteristics of the Norman period in their mouldings. A conspicuous example was the south doorway of St. Lawrence's Church, Reading. It had pure Early English mouldings in the arch, but it retained its semicircular head, and it had shafts attached to the jambs of the door, which was a sign of late work in itself, and which still retained their Norman characteristics. There were eighty-six churches in Berkshire, or other buildings, which have at present, or till recently had, Norman doorways. He was sorry he had to put in the words "till recently," because there was no doubt that within the past fifty years a great many of their old doorways had been swept away. Restoration did sometimes a great deal of mischief, and was often synonymous with destruction. It was a great pity when these old doorways, which were sometimes the only relic of the original building, were destroyed, and it was a thing which he hoped would not be repeated in these more enlightened times. Norman doorways also existed at Sutton Courtney and at Appleton Manor House, where there was an Early Norman doorway, and another remained in a barn at Brimpton. It was a very interesting one and contained a Maltese cross, which was especially applicable to the Order of St. John of Jerusalem, by whom it was erected. There w nothing unusual about their Berkshire doorways—in some par of England there were some special characteristics in t moulding—but they had interesting doorways which dat from early, or what he called the third period, at Padworth, Ti marsh, Avington, Thatcham, Chaddleworth, Bucklebury and o or two others. They had a few examples at Wantage, Shillingfo and elsewhere of what he might call most remarkable moulding in the curious beakheads, the meaning of which appeared to be mystery. The doorway at Charney was also unique, as far Berkshire was concerned. Thirty-two of the most interesti of the old doorways were shown on the screen, Mr. Keys explaining the interesting features of each. They could rough be divided into four periods :—1st period, Aston Tirrol 2nd period, Buckland and Marlstone; 3rd period, Padwor (north and south doorways), Aldermaston, Hanney, Wargra Bucklebury, Tidmarsh, Avington, Thatcham, North Hinkse Hatford, Chaddleworth, Lockinge, Faringdon, Kintbur Cholsey and Brimpton; 4th period, Charney Basset (Wantage, Shillingford (with north and south doorway Lambourn, Ashbury, Woolstone, Abingdon, Wokingha Stanford Dingley, Childrey, and St. Lawrence, Reading.

Some time was afterwards spent in examining a fine co lection of large photographs, belonging to Mr. Keyser, Norman doorways in Berkshire, and which included, in additio to those mentioned, photographs of the doorways at Catmo and Sparsholt, and also a series of five of the fine old doorwa at Iffley, Oxon, one of the most beautiful specimens in t country. Mr. Keyser also showed on a screen a miscellaneo collection of some of the best relics of Norman doorways i the country, and a complete series of those existing in Yorl shire and Oxfordshire were also on view.

GENERAL.

The Annual Dinner of the Architectural Association take place on Wednesday, May 31, at the Holborn Restaurant.

An Exhibition of drawings by the late Puvis de Chavenne will be opened next month in the Musée Galliera, Paris.

A Meeting of the Municipal Officers' Association will b held at the offices of the Wimbledon Urban District Council o Wednesday next.

The Government have, it is said, resolved to take ove the building and grounds of the Imperial Institute, making i national property. A prominent portion of the scheme is pro vision for the housing of the London University. The Uni versity will be the tenant, not of the Imperial Institute, but c the Imperial Government.

The Visitors to the Salon have paid for admission durin the first fortnight of the exhibition 104,315 frs. On Thursda in last week 15,269 frs. were received. The daily average 5,000 to 6,000 frs.

Mr. W. Roland Peck, of Messrs. Hampton & Son London, has been unanimously elected president of th Auctioneers' Institute of the United Kingdom.

The London County Council have declared that, whils unable to take action in the erection or subsidy of a permaner opera house, they are prepared to consider proposals fo reserving a site in connection with one of its central improv ments for the purpose of its being used for the encouragemen of the art of operatic music.

Mr. A. Carnegie has offered 50,000*l.* towards th Birmingham University endowment fund, and an anonymou friend has promised 37,500*l.* The quarter of a million require is nearly obtained.

The Surveyors' Institution have awarded the Penfo Gold Medal to Mr. Sydney A. Smith, of Messrs. Weatherall Green, 22 Chancery Lane.

Tudor House is not at present to be demolished by th County Council, and may be saved if the public of London w show an interest in the building.

Messrs. David Burnett & Co. have sold at the Mart t freehold of No. 54 Cheapside, in the occupation of the Lond Stereoscopic Company, for 28,500*l.*, subject to the lease havi eighteen years unexpired at 400*l.* per annum. This price equivalent to 60*l.* per foot super in possession.

Mr. B. T. Batsford will shortly have ready a new bo on "Embroidery." It will be the combined work of Mr. Lew F. Day, who is just completing a course of lectures on t subject at the Royal Institution, and of Miss Mary Buckle, accomplished embroideress and teacher of the art. Its sco is practical, and it is addressed to all interested in embroide and embroidery design. It will be fully illustrated by repr ductions of needlework on a scale large enough to show t stitch, and the artistic and technical sides of the art will treated with equal thoroughness.

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must not necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. *on Thursdays.*

YORK.—May 26.—For stripping and slating with new Westmorland slates a portion of the asylum buildings. Mr. Wm. Hepper, architect, 4 Spurriergate, York.

THERE has recently been completed at the works of the General Electric Company of America at Schenectady, New York, an iron foundry which is one of the largest buildings of its character in the world. It is, perhaps, fair to assume that it represents the best modern practice, as no expense was spared in its construction and equipment. The contents of the foundry is 3,250,000 cubic feet, and it is warmed by two fans blowing air from out of doors through coils and forcing it into the building. The total surface in steam coils is 27,500 square feet. The building is lighted by day by unusually extensive sky-lights and a large number of windows, some 23,300 square feet of skylights and 12,286 square feet of windows being provided. For lighting the building at night arc lights are provided for every 2,600 square feet of floor surface.

MESSRS. KIRCHNER & CO.

OWING to the exigencies of space we were not able, in dealing with the various exhibits at the recent Builders' Exhibition, to do much more than mention that the above firm showed a good collection of wood-working machinery. Yet the machines were of such a nature that a somewhat more detailed account seems to be due to such a very interesting and useful display.

One of the first machines to attract attention was a 36-inch band saw. This is the makers' latest design, and is fitted with all modern improvements, having special safety guards which have won the approbation of H.M. Inspectors of Factories. In this machine the saw pullies and spindles are in one piece and revolve in long adjustable bearings—an arrangement which is better than having the saw pullies revolving on fixed spindles. The machine has also the makers' improved arrangement for instantly adjusting the top wheel at any angle.

There was also the makers' new 12-inch hand-planer with

The whole of the Regulator and Fittings used at the Acetylene Gas Exhibition, IMPERIAL INSTITUTE, were supplied by STRODE & CO.

Head Office and Works: 48 Osnaburgh Street, Regent's Park, N.W.

Show Rooms: 188 Piccadilly, W.; 67 St. Paul's Churchyard, E.C

bles 8 feet long, each table being supported with double des. This machine has an adjustable fence for canting, and fitted with the makers' telescopic safety-guard, which has on a good deal of favour among users. It should also be entioned that this planer works with several patent attachents, originally invented by Messrs. Kirchner, for square or iral turning, raising panels, mouldings and other work, and can be combined with a mortising and slot-boring arrangeent.

Messrs. Kirchner had also a useful panel-planer 24 inches de, which will work heavy planks or thin veneers with ual facility. This machine has a well-devised and improved eding-gear in place of the usual tooth-clutches. Similar in inciple is the 15-inch three-cutter planing and moulding achine, which is also made as a four-cutter with a bottom tter-block.

Then there was the makers' tenoner with improved antiction sliding carriage, all the spindles being extremely heavy id of full strength for 6-inch tenons. The combined spindleoulder and recessing machine also deserves mention. The ottom spindle is arranged with loose top spindle ends with tra long cones, and the machine works with several attachents for different purposes. It can be easily adapted as a cessing machine and combined with a useful attachment for air work.

Another very useful machine was shown in the shape of irchner's patent under-driven mortiser, a machine which the akers claim to be the only one in the market which requires foundation, as it works steadily and quietly even on wooden ors in the upper storeys of a shop. Also useful would be the nall band saw for hand or foot-power, and which is so conructed as to withstand the strain of steam-power, to which it n be very readily adapted.

Messrs. Kirchner also showed some good grinding machines, nong them an automatic grinder for planing knives, a nife-grinding machine for hand motion, and another for oulding knives.

Finally, it should be said that the foregoing mechanical evices form but a small proportion of the numerous machines id attachments which are manufactured by Messrs. Kirchner, id of which more than 600 of different kinds are always in ock.

FOUNDATION-STONES have been laid of new schools at Vellington Road South, Stockport.

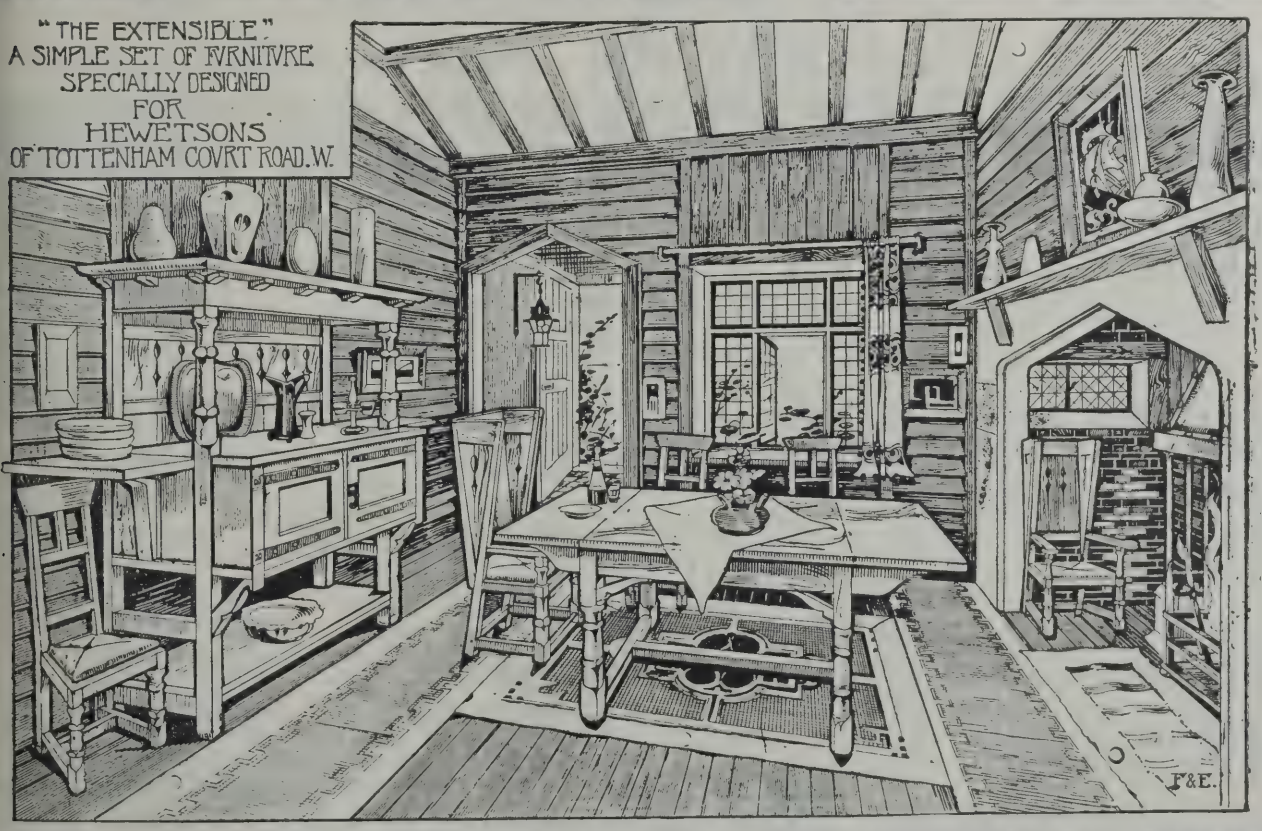
TRADE NOTES.



THE new infirmary, Basingstoke, is being warmed and ventilated by means of Shorland's patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. EDGAR KEELING, TEALE & CO., LIMITED, of 102 Mount Street, Berkeley Square, W., have been entrusted with the execution of the wrought-iron gates, grilles and heavy covered ways to the principal entrance at the Carlton Hotel, Haymarket.

SINCE the disastrous fire at Hyde Park Court, Messrs. Merryweather have been devoting their attention to a system of sprinklers for automatically extinguishing fires in lift shafts. This appliance will be fully appreciated by the public, especially those who frequent hotels and other buildings fitted with lifts.

AT the Palace Theatre Mr. Morton adheres to his well-known policy of "the best of everything" and constant change. The charmingly piquante Ada Reeve is back again with some telling songs, as is Ludwig Amann with his remarkably clever impersonations of celebrities, and the ever-amusing Harry Paulton. Mdlle. Chester and her wonderfully trained dog pose very effectively in a series of living pictures. The programme also includes such popular favourites as Edith Courtney, Julie Mackie, the Sisters Elinore, Clan Johnstones, Grell and Grey, Delmarre and others, to say nothing of the perennial and always increasing attractions of the American Biograph, to which new pictures are being constantly added.

VARIETIES.

Messrs. Hobson, Richards & Co. announce that they have sold the Dudding Hill Estate, Willesden, offered by them at the Mart last month.

The King of the Belgians has conferred the Order of Leopold on Mr. Drew-Bear, in recognition of his long and valuable services to the iron and steel industries of Belgium, in which he has for so many years been largely interested.

A paper will be read before the members of the London and Middlesex Archæological Society on Monday evening, at the London Institution, by Mr. Charles Welch and Mr. F. C. Eeles, on "Recent Discoveries in the Church of St. Michael Bassishaw."

While about a thousand people were assembled in the church at Burgo de Osma, Spain, to celebrate the Feast of the Virgin, last week, the choir fell in with a tremendous crash. The terrified congregation made a rush for the doors, and in the panic and confusion which followed thirteen persons were more or less seriously injured.

In the course of the excavations for foundations at Skibo, in Sutherland, two ancient cists have been unearthed. They were underneath the walls of the old castle, which has been demolished. The contents were human skulls and other bones, most of which crumbled on exposure to the air.

Mr. Alfred H. Botwright, who has been connected for many years with *Furniture and Decoration* and the *Furniture Gazette*, has purchased the copyright and goodwill of these papers, and will continue to publish same under the name of the *Furniture Record*, at 68 Finsbury Pavement.

The Croydon County Council have unanimously elected Mr. G. F. Carter, principal assistant to the Leeds city engineer, as deputy borough engineer of Croydon. The applications numbered 106. Of six finally selected, Mr. Carter was recommended as the best. The salary is 400*l.*, with a prospect of becoming borough engineer of the healthiest town in the United Kingdom. Mr. Carter entered the Leeds city engineer's office in 1883. For some years he was engaged in the drawing office. On the adoption by the Corporation of the scheme for the clearing of the York Street insanitary area, Mr. Carter was appointed at an advanced salary to assist the committee who have this important project in hand. In this capacity he proved a most valuable servant, and gained experience that is sure to prove of great utility in later years. On the resignation of Mr. Nichols as assistant engineer about twelve months ago, Mr. Carter was unanimously selected by the Council to fill the vacancy. For a considerable time past Mr. Carter has been a prominent member of the Yorkshire College Engineering Society, of which he at present holds the position of hon. secretary. He commences his duties at Croydon a month hence.

The General Steam Navigation Company announce the following coastwise and continental excursions for the coming Whitsuntide holidays. There will be a departure from Irongate and St. Katharine's Wharf, Tower Bridge, for Ostend, on Saturday, the 20th inst., at 7 P.M., returning from Ostend on Tuesday, the 23rd inst., at 11 A.M. Passengers will be booked to Brussels and back by this route. For Bordeaux, also from Irongate and St. Katharine's Wharf on Saturday, 20th inst., at 9 A.M. The departures for Hamburg, viâ Harwich, from Liverpool Street station at 8 40 P.M., will be as usual on Wednesday, the 17th inst., and Saturday, the 20th inst., returning from Hamburg (to meet the convenience of excursionists) on Sunday, the 21st inst., instead of the 22nd, and on Wednesday, the 24th inst. On Saturday, May 20, Whit Sunday and Whit Monday, excursions will be run, weather permitting, each day by the company's new saloon steamer *Eagle*, or other steamer, to Southend, Margate and Ramsgate, and back, leaving London Bridge Wharf at 9.10 A.M., Greenwich Pier 9.30 A.M., Woolwich (South) Pier 9.50 A.M., and Tilbury after the arrival of the special train leaving Fenchurch Street station at 10.15 A.M.; returning from Ramsgate at 3.15 P.M., Margate at 4 P.M., and Southend at 5.30 P.M. each day. The *Laverock*, or other steamer, will leave London Bridge Wharf for Yarmouth on Saturday, May 20, at 9 A.M., Greenwich Pier at 9.20, Woolwich (South) Pier at 9.40, and Tilbury Pier after the arrival of the special train leaving Fenchurch Street station at 9.45 A.M; returning from Yarmouth on Monday, May 22, at 8 A.M. Circular tickets down by boat to Margate and Ramsgate, and up by South-Eastern Railway or London, Chatham and Dover Railway, and down by boat to Yarmouth and up by Great Eastern or Great Northern Railway, will be issued as usual.

The accommodation in the girls and infants' departments of St. John's School, Carrington, Notts, having become inadequate to the number of children attending, the managers have decided to enlarge them. The estimated cost of the alteration is over 300*l.*

SOLE MANUFACTURERS OF PATENT SELF-CLOSING
ARMOURED FIREPROOF DOORS

OFFICIALLY ENDORSED BY THE FIRE OFFICES COMMITTEE.
THE ONLY SLIDING FIREPROOF DOOR ACCEPTED.

Lighter and Cheaper than Iron Doors.

Will not Warp or Twist out of Shape.

Proved in many actual Fires.

Special Doors and Fireproof Shutters carefully constructed.

FIRE AT THE WORKS OF THE ANAGLYPTA CO., DARWEN, LANCASHIRE.

The door we fitted in these works, although subjected to a heat intense enough to melt brass taps and fittings near it, withstood the heat perfectly, and can now be inspected at our works in Manchester, fit for duty. The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ½ of an inch.

FULL PARTICULARS AND ESTIMATES FREE.

BUILDING AND BUILDERS.

THE Local Government Board have given their sanction to the Birmingham City Council borrowing 10,100*l.* for the erection of artisans' dwellings in Milk Street, and having also approved of the plans of the buildings, the improvement committee at their meeting were in a position to decide to advertise for tenders for the erection of the houses forthwith. The proposal is to build sixty-one tenements, in four blocks, on the dual system.

A NEW company has been registered the (Isle of Walney Estates Company, Limited), with a capital of 100,000*l.*, all of which has been subscribed, to develop Walney Island, Barrow-in-Furness, into a seaside resort. Already practically the whole of the land in the north of the island has been purchased with this object. A part of the land has already been disposed of, on which Messrs. Vickers, Sons & Maxim are about to build at once from 600 to 1,000 houses for the workmen employed at their naval construction works. There is a great scarcity of houses at present in the town. The rest of the land purchased will be laid out on a big scale as a watering-place, with an extensive frontage and fine promenade on the west shore, washed by the Irish Sea. Here are located fine bathing sands, and many advantages likely to make Walney-on-the Sea a very popular seaside resort. The work has already been commenced, and the scheme is not only an extensive and important one, but will be pushed to a successful issue.

NEW CATALOGUES.

MESSRS. WADSWORTH & SONS are sending out a new catalogue descriptive of their self-landing and delivery hoists, cage hoists, friction hoists, hand hoists, safety doors, shafting, pulleys, pedestals, &c. Perhaps the most important of these is the first named, which has been designed with a view to dispensing with the dangerous and laborious work of swinging the goods into the room. The hoist is controlled by a lever placed near the doorway, so that the operator can see both inside the room and the lurry standing outside. The movement of this lever corresponds with the movement required on the hoist; thus, to hoist requires the lever to be raised; to travel out an outward movement of lever is required, &c. The jib of the hoist can be made to draw inside the room if required by the Corporation authorities. It is claimed for the self-landing hoist that it is the only one in the market which requires one strap or rope to drive. Messrs. Wadsworth & Sons have invented a patent safety carriage, which makes it impossible to travel too far, and this has been successfully applied in cases where the carriage has run over the end of the jib, greatly endangering the lives of persons loading or unloading underneath.

MESSRS. RICHARD MELHUISH, SONS & CO., of Fetter Lane, have just completed a very well arranged and well illustrated catalogue of tools for all classes of metal workers and plumbers. It contains upwards of 300 folio pages, and includes illustrated descriptions of the numberless tools and appliances for the high quality of which this old-established firm has acquired such a wide reputation. The book is well arranged, admirably printed, and handsomely and substantially bound, and as all prices are given it will be found a very useful book of reference for all interested in these branches of trade.

MESSRS. MARK FAWCETT & CO., whose system of fire-resisting floors, ceilings and roofs is too well known to require a detailed description, have just got out a handsome album of views of the numerous buildings erected for H.M. Government in which it has been employed. The views, all of which are from photographs capitally reproduced, give an admirable idea of the method of employing the system and the magnitude of the works in which it has been employed.

WE have received the new price list which the Wortley Fireclay Company have just issued. It contains descriptions of the various plain and fancy bricks which they make, coloured representations of the tints in which they manufacture their well-known glazed bricks, and draws special attention to their new patent keyed-back tiles, which are for use in dadoes and as wall and ceiling linings to new or existing buildings. For these it is claimed that it is absolutely impossible for them to fall out or move in any direction after fixing. They are especially useful where it is desirable, but impossible or very costly, to pull down a wall and rebuild it with glazed bricks, as they can be very easily fixed, and make a neat and safe job. They can also be fixed to the under sides of ceiling joists without cement. They can be made in any size or shape as required.

AUTOMATIC OR NATURAL VENTILATION.

ONE of the most serious drawbacks to the application of this system of ventilation is its liability to down-draughts, largely induced from the peculiarities and position of the buildings ventilated, and not infrequently aggravated by the character and construction of the appliances used.

Vol. LX. of THE ARCHITECT. Handsomely bound in Cloth. Price 12s. 6d.

It is a well-known fact that all buildings which are overtopped by higher erections are specially liable, when fitted with the ordinary turret or louvre ventilators, to a downpour of cold air through their connecting pipes, causing great discomfort and serious injury to the health of the occupants. It is therefore essentially necessary that, if perfect extraction is desired without any downward tendency, every care should be taken to ascertain that the ventilators used are so carefully arranged in all details of construction that the air currents will be directed in the upward course desired.

Hitherto but little attention has been given to this point. The ventilating engineer or manufacturer, having proved his ventilator sufficient in ordinary circumstances, contented himself by fixing an automatic valve arrangement underneath the ventilator or in the connecting pipe or hopper, such arrangements proving invaluable in ventilators which are not fixed on ridge of roof. But all such remedial measures prove abortive in the turret ventilator, as they so hinder the extraction of the vitiated air as to reduce it to a minimum.

The Climax Ventilating and Heating Company, Limited, of Glasgow, have lately provided a ventilator in which the louvre arrangements and protecting shields are so constructed that perfect security against down-draught under all circumstances is guaranteed without valve arrangements. These "Improved Climax" patent natural exhaust ventilators have lately been put upon the market and supplied for many important buildings, being quite a departure from the usual louvre arrangements and a marked progressive improvement in the science of ventilation.

FLANGED PLATE SAFES.

EVERY day announcements can be read of immense English dictionaries, and it is difficult to decide which contains the largest number of words. Apparently we are richer in verbal wealth than the rest of the inhabitants of the world. It is therefore hard with so much at our disposal to accept the Carlylean doctrine of silence being golden. But in spite of our amazing verbosity, it must be confessed that in respect to what many will consider as the most important variety of speech we are poverty stricken. We refer to technical terms. Inventors are a silent race—they leave their works to speak for them. As a consequence it is almost impossible to describe any important invention or improvement in manufactures without employing words and phrases which may readily be interpreted as applying to something else in the same division of practical science. Much of the costly litigation which arises in connection with patents is due to the equivocal use of words, although the main cause is the poverty of the English language and the dread which most men have of inventing new terms. The long controversy which was necessary before such words as an ohm, an ampère, a coulomb, a rheostat and others could be introduced in the nomenclature of electricity, suggests English conservatism in linguistics. The Germans, by their method of compounding words regardless of the length of the results, have an advantage over us, and the passion of the French for annexing words and phrases from other languages preserves them from the difficulties we must encounter.

The risks which arise from the scantiness of the English technical vocabulary are most onerous for journalists, and few can escape from them. We have been informed that recently we did not prevent ourselves from being numbered among the victims. In writing the preliminary notice of the Building Exhibition it is said we described some safes in terms which are no less applicable to safes which were manufactured during the last nine years by Chatwood's Patent Safe and Lock Company, Limited, of Bolton. Amidst the confusion which is inevitable when an exhibition is in course of arrangement there is no opportunity for comparison of inventions. The most that can be done is to describe with accuracy and impartiality, and this we claim to have done. Questions of origin will not be investigated by the authorities of the Patent Office, and the judges of the High Court are not always gladdened whenever such questions come before them. Priority of invention is so intricate a subject, it would be unfair for any individual writer to be dogmatic in deciding about contending claims unless he has made a special investigation, or, in other words, has discharged judicial functions. We have described the advantages which arise from flanged plates when used in safes, and about the security they furnish there can be no doubt. It is a question of practical science, but the legal aspects are necessarily out of our purview.

That safes with flanged plates have been manufactured at the Lancashire Safe and Lock Works since 1890 cannot be doubted. There are numerous bankers and others who would willingly testify to the fact and acknowledge the sense of security which such strongholds impart to them. What is more, a specification of the invention giving all particulars and illustrated with several plates can be obtained. It is numbered 4,100, and was accepted on March 7, 1891. The invention is

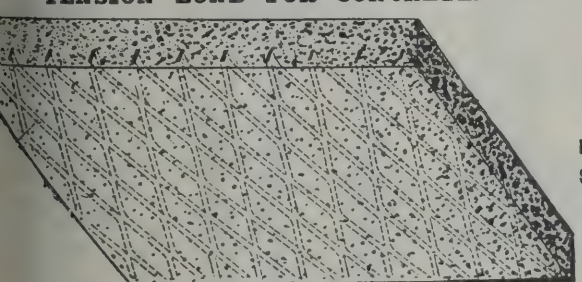
d to have for its object "improvements in safes and strong ›ms, and in apparatus for manufacturing same, parts of ich are also applicable to other purposes." The inventors, muel Chatwood, Samuel Rawsthrone Chatwood and Arthur unel Chatwood, say:—"We make the sides of a safe of a ctile plate, and along the front and back edges of the plate, either of them, we form flanges to project inwardly from the e of the plate." How the flanging of the plates may be complished, either heated or cold, by placing the edges juired to be flanged between a pair of blocks of suitable form described in detail. The specification goes on:—"We then (if e safe is intended to be rectangular) bend the plate transrsely to form the four corners, and to facilitate the bending cut pieces from the flanges where the bend is to be formed." ie whole process of manufacture and fitting of the parts is scribed as precisely as possible, and from descriptions and awings there would be no difficulty in manufacturing the proved safes and strong rooms. Everything is straightward, and the specification might be said to err in the fulness information which is imparted. It therefore stands recorded industrial annals and the records of the Patent Office that nged safes came into existence nine years ago, and that they ve demonstrated the utility claimed for them originally by e inventors, Messrs. Chatwood, is proved by the numbers ued from the Bolton works, as well as by the trials which any of them have victoriously sustained.

INSTITUTION OF ELECTRICAL ENGINEERS.



RRANGEMENTS are being made for a visit of the Institution Switzerland in September next. As at present arranged, embers will visit the Rheinfelden works on Saturday, Sepmber 2, will proceed on the same day to Zürich, and will main there until September 6. During this time visits will paid to the works of the Oerlikon Company, of Messrs. rown, Boveri & Co., and of Messrs. Escher, Wyss & Co., and certain power stations and tramway and lighting installations the district, including, as it is hoped, a visit to the Schaffiusen works. They will then proceed to Lucerne, and, after specting the street railways of that town and, if time ermit, the Rathhausen works and the Stansstad-Engelberg ailway, will travel *via* the Brünig Pass to Interlaken. ere opportunity will be given for visiting both the Jungfrau ailway (*via* the Wengern Alp route) and the Burgdorf-Thun Railway, as well as other places of electrical interest in the neighbourhood, and the visit will end on Saturday, September 9. The annual conversazione of the Institution will be held at the Natural History Museum, South Kensington, on the evening of Thursday, July 15.

THE LATE G. F. LYSTER, C.E.

FOR more than thirty years the name of George Fosbery Lyster has been associated with the great improvements in the Mersey Docks, on which the prosperity of Liverpool mainly depends. It might be said that his death was caused by his devotion to duty, for it was during attendance at the trial in Liverpool arising out of an accident to a steamer in the Birkenhead Docks he caught the chill which proved fatal to him.

The career of Mr. Lyster, says the *Liverpool Courier*, was a most distinguished one. He was born on September 7, 1821, at Mount Talbot, co. Roscommon, Ireland, and was the third son of the late Colonel Anthony Lyster, of Lysterfield and Bushey Park, Roscommon, his mother being Jane Fosbery, second daughter of Mr. George Fosbery, of Coleraine, co. Limerick. The Lysters were originally a Yorkshire family, and the deceased gentleman was related to many well-known families both in that county and in Ireland. He was educated primarily at King William's College, Isle of Man, and finished his education at a private school. Having chosen civil engineering as his profession, he became a pupil of the late Mr. James Meadows Rendel, F.R.S., one of the most distinguished engineers of his day. Mr. Lyster in after life joined the Institution of Civil Engineers, was on its Council, was a Fellow of the Royal Society of Edinburgh and other scientific bodies, and was also a lieutenant-colonel in the Engineer Volunteer Staff Corps. In the early part of his career Mr. Lyster was engaged professionally on engineering works of magnitude and importance. After he had finished his pupilage he was appointed by the Government as an assistant resident engineer on the works for the improvement of the river Shannon. Subsequently he assumed an important position in England under his late chief, Mr. Rendel. For years he was actively engaged in parliamentary, railway, harbour and dock engineering. When the Government decided upon the great refuge harbour at Holyhead Mr. Lyster was appointed the assistant resident engineer. At the termination of this work he was again selected by the

PRICE LIST AND ESTIMATES ON APPLICATION.

Government to the post of resident engineer for the new harbour works at Guernsey.

Out of seventy competitors he was in 1861 appointed engineer-in-chief to the Mersey Docks and Harbour Board, succeeding the late Mr. John Bernard Hartley. He also became engineer to the Wallasey Embankment Commissioners. Among the works that he designed and carried out were the Birkenhead Docks, the Wallasey Dock, the Morpeth Branch Dock, the grain warehouses and River Craft Dock, the composite warehouses, the graving Docks, the cattle lairages, the tower buildings, with their powerful engines and machinery, vast quay sheds, coal hoists, the Woodside landing-stage and the floating roadway, also the Wallasey stage and other works on the Cheshire side connected with the Dock Board system. Under his direction a vast amount of work on the Liverpool side of the Mersey was done for the development of the Dock estate and the improvement of our magnificent line of docks, which, thanks to Mr. Lyster's initiative, now accommodate the largest vessels afloat. Among these stupendous undertakings may be mentioned the docks at the north end and in Bootle, where the great steamers connected with the Atlantic and other trades are berthed. It was a memorable incident in connection with Mr. Lyster's career as a dock engineer, the designing and construction of the Alexandra Dock, which was opened amid great ceremony in 1881 by their Royal Highnesses the Prince and Princess of Wales. There was also the Huskisson Branch Dock, the alteration and part reconstruction of the Canada and Huskisson Docks, with a third branch and half-tide dock on the site of the Sandon Basin and Wellington Half-tide Dock. By his engineering skill there were made large entrance and deep sills to make these docks suitable for the largest and heaviest draft ships. Then there was the Waterloo Dock, with its great grain warehouses and appliances for the unloading and manipulation of grain, and that engineering feat which is the marvel of visitors, professional and otherwise, the combined landing-stages, the floating roadway on the site of George's Basin, and the new roadway leading to the stages, which has developed and facilitated the great cross-river traffic both in passengers and goods. Under Mr. Lyster's auspices there was constructed on the stages accommodation for the Customs and other officials, and the numerous passengers arriving or departing from the Mersey.

A few years ago there was a great danger of a serious interruption of the traffic at the landing-stage owing to the difficulty of the cross-river and other steamers approaching the stage. This arose from the accumulation of sand and th encroachments of what was known as the "tail" of the Pluck ington Bank. The deceased gentleman designed, and unde his direction was constructed, a sluicing system at the back o the landing-stage for the purpose of removing the dangerou sand accumulations. This plan, however, was only attende with partial success, and now a number of dredgers have to b employed to prevent the navigation of that part of the rive being seriously interrupted.

Among his other undertakings Mr. Lyster is credited wit the original design of the overhead railway, since carried int effect by the present company, the construction of the Petro leum Casement Stores at the Herculaneum Dock, and th vast system of petroleum tanks at that part of the doc system. These and other works occupied Mr. Lyster's atten tion during his long and busy connection with Liverpool. H devised and carried out an extensive system of pumpin engines and machinery, both at Liverpool and Birkenhea docks, which insures a depth of water at the older docks equa to that of existing spring tides, thus insuring their use b vessels throughout the year. He also initiated the deepenin of the approaches to the river by means of dredging, and othe works now in progress in connection with the great port o Liverpool are due to his energy and professional skill. I 1889 Mr. Lyster was permitted by the Dock Board to b relieved of part of his duties by his son, the present engineer Mr. A. G. Lyster. The deceased was a model of gentlemanl bearing and courtesy. He was a familiar figure, and wa always popular in the best circles of Liverpool society, and wa an active member of some of the learned bodies of this city He was always considerate to the numerous staff under hi direction, and his death will be deplored by a very wide circl of professional and private friends.

WORKMEN'S COMPENSATION ACT.

THE fourth subsection of section 1 of the Workmen's Com pensation Act, 1897, is as follows:—"If within the time here inafter in this Act limited for taking proceedings, an action is brought to recover damages independently of this Act fo injury caused by any accident, and it is determined in such action that the injury is one for which the employer is not liable in such action, but that he would have been liable to pay compensation under the provisions of this Act, the action sha

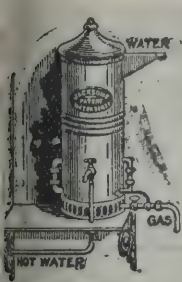
be dismissed, but the Court in which the action is tried shall, if the plaintiff so choose, proceed to assess such compensation, and shall be at liberty to deduct from such compensation all the costs which, in its judgment, have been caused by the plaintiff bringing the action instead of proceeding under this Act." The appeal case Edwards *v.* Godfrey, which was heard in the Court of Appeal on the 13th inst., exemplifies the consequences which follow from the above subsection.



The respondent, Edwards, was in the employment of the appellant, Godfrey, and was employed on a building over 30 feet in height, upon the top storey of which a studio was being erected. A scaffolding was used in carrying out the work. The respondent was employed in glazing the studio, and on September 12, 1898, he was descending from the outside of the studio when he fell to the ground and was injured. The respondent brought an action against the appellant in the Wandsworth County Court under the Employers' Liability Act, 1880, and this action was tried on January 9, 1899, before a jury, when the jury found that the respondent was guilty of contributory negligence, and judgment was given for the appellant. No application was then made on behalf of the respondent to assess compensation under the Workmen's Compensation Act, 1897. On January 30, 1899, the respondent took proceedings to recover compensation under the Act of 1897, and on March 13 the County Court judge made an award in his favour and assessed the compensation at 11*s.* a week.

Mr. Frank Gover, for the appellant, contended that by section 1, subsection 2 (*b*) and subsection 4, of the Workmen's Compensation Act, 1897, the workman could claim compensation either under the Employers' Liability Act, 1880, or under the Act of 1897. He could not take two independent proceedings. By section 1, subsection 4, of the Act of 1897, if an action was brought to recover damages independently of that Act, and the action was dismissed, the Court might, if the plaintiff chose, proceed to assess compensation under the Act of 1897, and might deduct from such compensation the costs caused by the plaintiff having brought the action under the Employers' Liability Act, 1880. That was in favour of the workman, and if he did not apply for compensation to be then assessed under the Act of 1897, he could not subsequently take proceedings under that Act. If he could take subsequent proceedings, then the employer would be deprived of the advantage of having the costs to which he was put by reason of the plaintiff having wrongly sued him under the Act of 1880 deducted from the compensation.

Mr. Colam, for the respondent, contended that the dominant idea of section 1, subsection 2 (*b*), of the Act of 1897 was to prevent the ordinary right of the workman being taken away, and the latter part of the clause prevented the employer being liable twice over. But neither that subsection nor subsection 4 said that no proceedings should be taken under the Act of 1897 if the action at common law or under the Employers' Liability Act, 1880, failed. Section 1, subsection 2 (*b*), said that the employer should not be liable to pay compensation twice over, but it did not do away with the double remedy. That subsection only applied to cases where the injury was caused by the personal negligence or wilful default of the employer or of some person for whom the employer was responsible. The County Court judge was therefore right.

The Court allowed the appeal.

Lord Justice A. L. Smith said that the workman failed to recover judgment under the Employers' Liability Act, 1880, and in ordinary circumstances that would be an end of the case as between the employer and the workman, and the employer in any subsequent proceedings by the workman for the same cause of action could plead *res judicata*. That finished the action under the Act of 1880. Subsequently the workman took proceedings and obtained an award under the Workmen's Compensation Act, 1897. The question was whether the workman, after having exercised his option of suing under the Act of 1880, should revert back to the Act of 1897. In his opinion section 1, subsection 2 (*b*), of the Act of 1897 gave the workman, in the circumstances there mentioned, the option of claiming compensation independently of the Act or under the Act. The workman here exercised his option of claiming independently of the Act. If it had not been for section 1, subsection 4, of the Act the matter would then have been *res judicata*. But that subsection gave the workman the advantage, when he had wrongly exercised his option of proceeding independently of the Act and had failed, of having compensation then and there assessed under the Act of 1897 by the Court which had seisin of the case. There was that *locus penitentiæ* given to the workman. At the same time a benefit was given to the employer by allowing the judge to deduct from the compensation awarded the costs caused by the workman having wrongly brought the action. If this were not the true construction of the Act, a workman who had failed in an action under the Employers' Liability Act, 1880, would never apply under section 1, subsection 4, of the Act of 1897 for compensation under that Act, but would always take fresh proceedings under

the Act of 1897, in which case the judge could not deduct the costs of the former action from the compensation awarded.

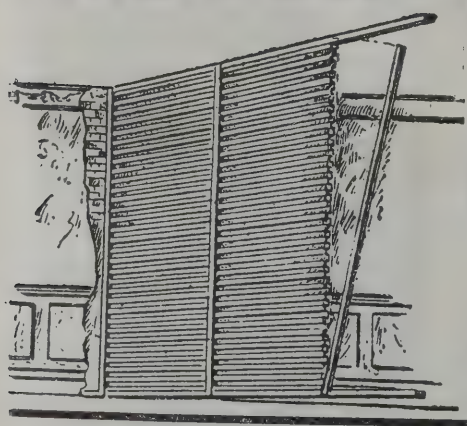
Lord Justice Vaughan Williams and Lord Justice Romer concurred.

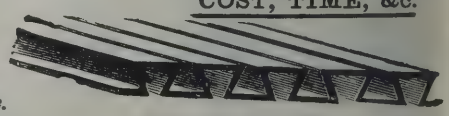
THE AUCTIONEERS' INSTITUTE.

THE ordinary general meeting of the members of the Auctioneers' Institute of the United Kingdom was held in the lecture-hall of the Institute in Chancery Lane on the 11th inst., Mr. Edward Dobson, the president, being in the chair. The report stated that 186 new members had joined during the past year, and the total number of members on the roll at the end of the year was 992. The income for the year was 1,985*l.* 18*s.* 3*d.*, and the expenditure 1,467*l.* 4*s.* 9*d.*, leaving a net balance of 518*l.* 13*s.* 6*d.*, which, added to the balance brought forward, showed a balance to the credit of revenue of 1,394*l.* 9*s.* 6*d.* The President, in moving the adoption of the report, said their object was to improve the status of the auctioneer, and they had achieved it to a considerable extent. Examinations were held and the number of entries for them was steadily increasing. Of thirty candidates who presented themselves in March, twenty-four satisfied the examiners. The Institute had various provincial branches. They were, he considered, rendering a service to the public by enabling them to have qualified and certificated men to carry on the business of auctioneers and valuers in this country. Mr. J. F. Field, past president, seconded the motion, which was agreed to. The members of the council retiring by rotation were re-elected and the following Fellows were elected members of the council:—Mr. B. J. Bridgewater, London; Mr. H. D. Buckland, Windsor; Mr. W. W. Cox, Torquay; and Mr. F. J. T. Horsey, London. The annual dinner of the Institute was held on Thursday night at the Cannon Street Hotel, Mr. E. Dobson presiding. Among others present were Mr. Rentoul, M.P., Mr. E. Flower, M.P., Mr. Balfour Browne, Q.C., Mr. G. M. Freeman, Q.C., Sir J. Fortescue Flannery, M.P., Mr. D'Arcy Wyvill, M.P., Mr. Wanklyn, M.P., Mr. T. W. Wheeler, Q.C., Mr. T. Milvain, Q.C., and Mr. C. B. Margetts (president of the Incorporated Law Society). Mr. Flower, M.P., proposed "The Auctioneers' Institute." The Chairman, in reply, said that the Institute aimed at the public rather than individual benefit, and the system of examination of young auctioneers and the granting of certificates was calculated to enhance the position of what he ventured to call their profession. Their membership extended throughout the three kingdoms. The uniting of the various distinct classes of auctioneers in one body was in the interests of the public. He expressed the gratitude of the Institute to the council, and especially the London members of it, for their untiring industry.

MUNICIPAL CONTRACTS.

A PAPER has been issued by the Employers' Parliamentary Council on the conditions of contracts with local authorities which are enforced in many parts of the country. The *Labour Gazette*, in its issue for April 1898, states that 163 local authorities in England and Wales, with an aggregate population of over eight and a half millions, include in their contracts conditions as to wages, and 219 local authorities, with a population of somewhat over nine and a quarter millions, specify various conditions as to employment (including conditions as to wages).





Eight hundred and sixty-seven local authorities, with a population of over seven and three-quarter millions, make no conditions as to employment in their contracts; but of these eleven indicate conditions which they desire to be observed, although not in the contract, and forty-one have never made any contracts. It is calculated that the whole of the urban districts of England and Wales (including London, about which the return gives no information) may be divided into two groups, the first of which, with a population of about thirteen millions, includes all districts where conditions of some kind as to wages are imposed; and the second, with a population of about eight millions, includes all districts where no such conditions exist.

According to an article on the Scotch Return in the *Labour Gazette* for April 1899, seventeen local authorities, with an aggregate population of a little over one and a half million, include in their contracts conditions as to wages, and twenty-four local authorities, with a population of nearly two millions, specify conditions as to employment (including conditions as to wages).

Two hundred and eleven local authorities, with a population of rather over two millions, make no conditions as to employment in their contracts.

The above particulars show the very large extent to which the local authorities of Great Britain have already adopted the

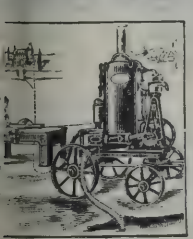
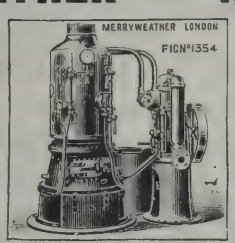
system of dictating to contractors the way in which they are to carry out their contracts. A case has occurred recently at West Ham in which this system of interference has been carried to an unprecedented extent. A firm of engineers, Messrs. Ferranti, whose works are in the Oldham district, and who pay the rates of wages recognised by the trade unions in that district, tendered for some work required by the West Ham Town Council. This body, after accepting the tender, insisted that the wages paid should be those prevailing in the Manchester district, with which neither they nor the contractors have any concern whatever. As stated above, some authorities require their contractors to pay the wages in force within the authorities' own districts, and some the wages in force where the work is executed, but it never appears to have occurred to any council before to enforce rates in a district with which neither party is connected.

This system of interfering with contractors not only imposes most unfair and onerous conditions upon them, but is distinctly prejudicial to the ratepayers, as contractors will naturally insist upon getting a higher price to compensate them for the vexatious conditions to which they have to submit. Many of the councils, indeed, who have adopted this policy would not be at all sorry to drive away the contractors altogether, as they would then have an excuse for executing their work by direct labour. This, of course, is the worst system of all for the ratepayers, as has been fully proved by the extravagance and corruption in the Works Department of the London County Council. It is satisfactory to note that in some places the authorities are at last beginning to rebel against the assumption of their workmen that they are to receive more pay and do less work merely because they are employed by a public body. According to an article in a recent number of the *Journal of Gas Lighting*, it seems likely that the policy of direct employment will shortly be abandoned at Leicester. It is to be hoped that this case will not stand alone, and that other local authorities will realise that their only true policy is to give the work to those contractors who will do it on the most advantageous terms, and to leave them entirely free as to the arrangements which they and their workmen may find it mutually convenient to make.

A leading member of the Employers' Parliamentary Council, writing to the secretary on May 11, says :—"The present system is heading straight for socialism. I certainly think that employers as citizens should oppose the principle of municipal trading by all means in their power. They have, moreover, a more direct interest in the matter: if this thing goes on the trade unions will become masters of the municipalities, and then it will be the employers' turn to be dominated by the trade unions. The employers must not let this thing drift, or they will suffer for it. The trade unions, having found their match in their late contests with Lord Penrhyn, Colonel Dyer and Sir William Lewis, recognise the fact that success cannot be had on those lines, and they have, as you must know, and as I learn from their reports, &c., resolved to follow municipal lines—that is, to capture the municipalities. I hope, therefore, we (the Employers' Council) will do something effective before the committee. Mr. Joseph Cowen said the other day in reference to municipal trading that 'it begins in Tooley Street and ends in Tammany.'"



AN ITALIAN CARPENTER IN ABYSSINIA.



A TELEGRAM from Massowah has just announced, says the Rome correspondent of the *Pall Mall Gazette*, the death of Giacomo Naretti, a modest but interesting figure connected with the Italian occupation of Africa. He was the son of poor Piedmontese peasants. Fate took him first to Egypt and then to the interior of Africa, before the Government of Rome had as yet turned their eyes to the Black Continent, and when Italian adventurers (in the best sense of the word) such as Cardinal Massaia (then only Monsignor), Gessi, Matteucci, &c., were especially helped and protected by England.

Naretti was a very ordinary carpenter, but his trade proved his fortune in Abyssinia. He built first for Emperor John and then for Menelik many, to them, strange and delightful things. His real fame in Ethiopia began with the construction of the throne of Solomon, which had a particular significance, as the Ethiopian sovereigns pride themselves on being the direct descendants of King Solomon and the Queen of Sheba. Later he built the royal palace at Makallè, becoming after that a kind of minister of public works, and marrying a woman called Theresa, daughter of an Englishman and a native.

However, all was not plain sailing with him. His troubles began with the Italian enterprises in the Red Sea. The Negus began to suspect him and expelled him from his dominions. He took refuge in Massowah, where he found occupation as the photographer of the place, while his wife became the interpreter of the local Government, as she spoke, besides the native languages, Italian, English and German.

MERRYWEATHER & SONS, Ld., the Largest Makers of High-Class Hose in the World,

GREENWICH ROAD S.E., & 63 LONG ACRE, W.C., LONDON; AND AT MANCHESTER.

THE ROYAL HOTEL, WEYMOUTH.

A NEW hotel of handsome and commodious design, beautifully situated and luxuriously appointed, was opened at this favourite resort on Tuesday. The Royal Hotel, which contains over a hundred rooms, has been erected from the designs of Mr. C. Orlando Law, of Arundel Street, W.C., by Messrs. Creaton & Co., and is a model of good arrangement, perfect sanitation and all that is most modern and approved of in details of equipment, electric light is installed throughout the hotel and telephones communicating with the office being placed in every room. The furnishing has been entrusted by the proprietor, Mr. T. H. Vinnicombe, to the well-known firm of Oetzmann & Co., of 62-79 Hampstead Road, London, W.

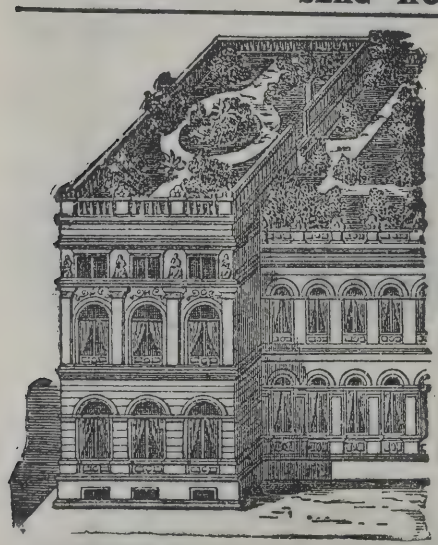
The entrance-hall lounge has a mosaic pavement and is very richly decorated in white and gold, the tasteful cornice and frieze being in bold relief. The carpet is a very handsome soft pile of rich colouring, and Oriental furniture of a luxurious description, consisting of lounges and easy-chairs covered in rich moquette, with elaborate draperies and curtains of figured velvets, help to make this a most comfortable and artistic feature of the hotel. Above is a conservatory, approached by a very handsome staircase in the "Dorothy" style, carpeted like the hall and prettily furnished with a number of very comfortable lounge wicker chairs, and a charming effect is obtained by a very fine collection of palms.

The grand banqueting-hall measures 66 by 33 feet and is capable of comfortably seating 300 guests for dining, or a considerably larger number when used for concerts, &c. It is a very lofty, well ventilated and carefully warmed room, richly decorated in fine soft colours.

The billiard-room, the reading-room, and table d'hôte room are handsome apartments, appropriately furnished.

There is, too, a very fine modern buffet and saloon bar, the mahogany tables having hammered copper tops, and a very fine registered design fitment with seats upholstered in moquette, producing altogether a beautiful effect. The two rooms over the arcade have been specially arranged for the reception of commercial travellers, and are luxuriously furnished as a dining and a reading-room. A large and suitably decorated room on the ground floor has been furnished as a smoking-room and here also comfort has been duly considered.

The drawing-room is tastefully decorated in pale shades of gold, and a soft and harmonious effect has been produced by keeping the furniture also in shades of the same colour. The floor is covered with a thick velvet pile carpet in a deep tone of gold, while the elaborate silk hangings and draperies match the lighter tones in the wall decorations. The furniture is the fashionable Sheraton style, beautifully inlaid; the sofas, chairs &c., are covered in yellow silk of pale and delicate shades. This room, when lit with electric light, is perfectly charming and amongst its appointments is an excellent semi-grand pianoforte by Pleyel. On the same floor there are several bedrooms and private sitting-rooms, some of them, in the Chippendale style, being particularly dainty and attractive.



There are hydraulic elevators to all the floors; all the staircases and corridors are richly carpeted; every modern and improved appliance has been fitted to the kitchen, and a celebrated chef is in charge.

ST. LEONARD'S CHURCH, GLASGOW.

AT a special meeting of the Established Church Presbytery of St. Andrews, held on Friday last in the vestry of the Town Church, St. Andrews—Rev. Dr. Fraser, Newport, moderator—consideration of the St. Leonard's Church case, postponed from last meeting, was resumed.

Rev. Mr. Todd, Kingsbarns, convener of the committee to examine and report on the plans submitted by the heritors for the restoration of St. Leonard's, submitted the report. He gave, in the first place, an exhaustive historical sketch of the past and present of the church, stating that the site of St. Leonard's Church was probably as convenient as could be selected, and that the population of the parish had increased considerably in recent years. There were in it 712 examinable persons above twelve years of age, and two-thirds, or 480 persons, was the number for which accommodation was required. He then read the report of Mr. John Kinross, architect, Edinburgh, whom they had consulted. That gentleman estimated that the cost of reconstruction would amount to 1,400*l.*, according to the first plan of Mr. Henry, architect. The additional cost of lighting and heating would be 120*l.*, and the expense of a vestry 200*l.* The cost of erecting a new church on the same site, in accordance with the dimensions as proposed by Mr. Henry, would be (using the old materials) 1,770*l.*, with 120*l.* for heating and lighting—total, 1,890*l.* The ruin, Mr. Kinross stated, could be made safe by the repairing of what existed, and the repairing of the existing structure was perfectly feasible. The Rev. Mr. Todd said that the committee directed the atten-

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 60 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

h of the Presbytery to the fact that the surrounding ground ght be built upon very close up to the walls of the church, d that there would be no retiring-rooms in what was pro- ed. The opinion of the committee was, he said, that the toration of St. Leonard's Church in the present circumstances uld be inadequate, and that the acceptance of it would be a ious injustice to the parish and the congregation of St. nard's.

Rev. Mr. Murray said that, strictly speaking, the report was irely in the hands of the committee. At the same time, as ties had been cited to the meeting, and had appeared, if y chose the Presbytery should hear them.

Mr. Welch thought the Presbytery should give all parties opportunity of reading, considering and discussing that ort at a future meeting.

Rev. Mr. Reid thought that it was quite reasonable that y should grant the request of Mr. Welch, and he moved cordingly.

Dr. Anderson seconded.

Rev. Mr. Murray remarked that he did not think they could otherwise.

Dr. Fraser: It should be understood that the committee's ort has not received the approval of the Presbytery.

The motion was agreed to, and the Presbytery resolved to journ till the second Wednesday in June.

Rev. Mr. Dunlop, Elie, moved that the University Court uld be asked to extend the period of the existing arrange- nts for the congregation worshipping in St. Leonard's until hurch is provided for the parish of St. Leonard's.

Rev. Mr. Todd seconded, and it was agreed to.

AN AUSTRALIAN ESTIMATE OF GLASGOW.

WRITER in the *Melbourne Age* says:—More wonderful even an Glasgow's wonderful expansion are the benefits which her izens reap from the wisdom of her management. Her nicipal system, widely as it has extended into socialistic vernment, is a model of prudence and economy. The vernment of Glasgow has been purely democratic, being that its people only. The first thought of the people seems to ve been to get a plentiful supply of water, as the primary eans of cleanliness and health. In this it is conspicuously ccessful amongst the cities of the world. It has tapped Loch Katrine, 35 miles away, and has an inexhaustible supply from the purest of mountain storages, over the blue bosom of which Scott's heroine propelled her boat. Every house has its service at a general rate of 6*d.* in the 1*l.*, and there is practically no check on the quantity used. The sewage and the street sweepings of Glasgow are utilised and converted into fertilisers for the reclamation of waste land. But keeping sanitation always in view, these are but a small part of what Glasgow has accomplished. Whole streets have been torn down with a view to the destruction of slums and rookeries, and the erection in their places of municipally-owned tenements and lodging-houses, public baths, washhouses, hospitals, night shelters, homes for the poor, public parks and a people's palace. There has been conspicuous courage allied to prudential administration. In 1866 the Corporation actually purchased about 100 acres in the centre of the city, and four miles of streets were made wider over the sites of demolished buildings, and public squares created. The total cost of this work, including the re-erection of a university, reached nearly to 3,000,000*l.* It was a large undertaking, and involved a sixpenny rate in itself. Many timid people prophesied municipal bankruptcy from it. It was intended that the land purchased should be resold, and the calculation was that the increased value of that land, fronting on open streets and squares, would more than repay the destruction of property. The city met, however, with a reverse. A depression set in. The land did not sell. Things looked ominous. But the strong men who guided the Glasgow Corporation never quailed. They borrowed more money and built tenements on their own streets. The new works drew back to the city its dispersing population, and brought about more favourable conditions. The city of Glasgow was thus launched into a great scheme of municipal socialism. It became the landlord of hundreds of model lodging-houses. Nothing could have turned out more successful. The increasing population gave to the public the unearned increment of this property, and the sixpenny rate, first struck to meet the interest on the loan, was gradually reduced, till now it is a halfpenny only, even if it have not been quite abolished. A large portion of this property is now amongst the free assets of the city amounting to some 600,000*l.* All these things show what a firm grasp the councillors of Glasgow have maintained on the public affairs of the city. Indeed, the surpluses of each year in the municipal balance sheet have been invested in real estate in the name of a fund called the "Common Good." This gives now a yearly income to the city

of 40,000*l.*, and permits the whole municipal business, including water and sewerage taxes, to be covered for 1*s.* 7*d.* in the 1*l.* on properties under 10*l.* yearly value, and for 2*s.* 3*d.* in the 1*l.* on properties over that appraisement. When the sewerage and water rates of Melbourne are added to the city rates, the total will reach in many places to more that 4*s.* in the 1*l.*, or about twice the rate of Glasgow. Yet the Scottish city has a perfect service of sanitary inspection, pays for its own police, maintains several hospitals, runs a service of river steamers, and owns and manages its tramways. This tramway system is, indeed, one of the wonders of the city. A company formerly ran it, and worked its employés from fourteen to sixteen hours a day. When the city took over the property at the expiry of the lease the hours of the employés were reduced from sixteen to ten; the cost of travelling to the public was reduced 33 per cent., and yet the city, after laying out 394,000*l.* for new plant, showed a profit on the first year of 29,000*l.* That shows what public management can do for the people as against private enterprise. The same management has given to the public museums, art galleries, halls for public entertainment, together with gas and electric lighting.

FIRST-CLASS HOUSES.

IT seems that the first-class houses of New York no more deserve their name than some of the first-class hotels. The disastrous results of the fire in Sixty-seventh Street and of the fire two blocks away, which was probably set by sparks from it, remarks a writer in the *New York Times*, were less disgraceful to the system of building which we permit than the results of the fire at the Windsor Hotel only because the inmates of the houses were in bed and asleep, and the inmates of the hotel were awake and alert. But that a casual fire should gather headway so fast that a dozen people should be burnt to death before they could make their escape or be removed proves conclusively that the building which was consumed with such swiftness was very far from being "a first-class house." First-class houses both the dwellings which took fire undoubtedly rated on the books of the underwriters, as well as on those of the house-agents. They were without doubt, like all the houses in the quarter, enormously costly, finished in complete disregard of expense, and with everything in sight of the most solid and costly kind. Yet none of the lavish expenditure upon them was directed to solidity of construction. They were not only not fireproof, but they were evidently not slow-burning. N was there even a fireproof and smoke-tight stairway from t to bottom. When a fire broke out there were not so go means of escape as the law requires for the flimsiest tenemer houses. There was nothing for the wretched inmates to but to jump from the windows as an alternative to being burn or choked to death where they were. The worst of it is th we have no reason to believe that there is any class of priva houses in New York better protected than these were again fire. It is evidently a misnomer to call such traps "first-cla houses." It is evidently an impeachment of our civilisatic that such houses are the best we can, or the best we do bui in the way of "domestic architecture."

PATENTS

[*This List of Patents is compiled specially for this Journal b Mr. G. H. Rayner, of the firm of Rayner & Co., Con sulting Patent Agents, 37 Chancery Lane, London, W.C from whom all particulars and information relating t Patents may be had gratuitously.*]

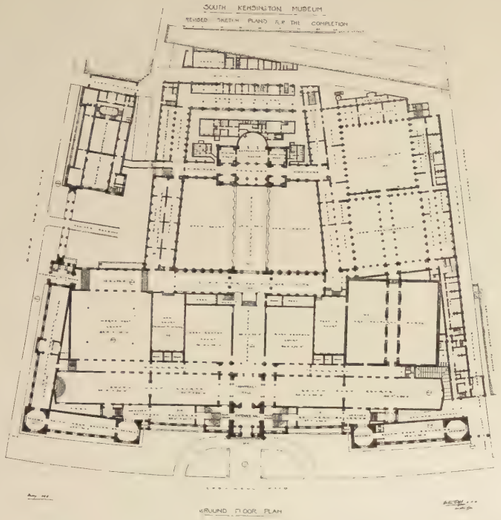
APPLICATIONS FOR PATENTS.

9095. James Robinson Hatmaker, for "Improvements ir process for making Portland cement, whiting and simila products."

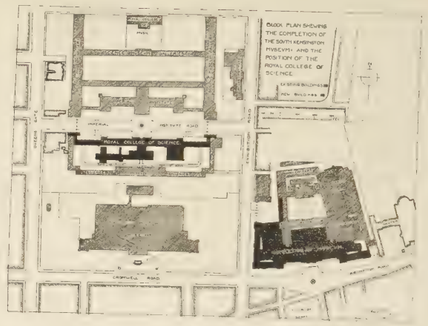
9135. Richard John Ross and Franklin Pratt Smith, fo "A new or improved window sash or the like."

9139. Percy John Neate, for "Improvements in means fo treating slurry in the manufacture of Portland cement and separating flints or the like therefrom."

9203. Henry Sechrist Vrooman, for "Improvements in fire-brick arches for furnaces and ovens."



9441. Herbert Alexander, for "An improved drying chamber for the hardening of bricks, artificial stone and the like."



9595. Abraham Isaacs, for "Improvements in tiles."

TO INVENTORS.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. RAYNER & CO., Patent Agents, 37 Chancery Lane, London, W.C.

THE WEEK.

FOR a quarter of a century the Comte HENRI DELABORDE was recognised as one of the arbiters of taste in Paris. With democrats his title was enough to compel them to look on him as a mere amateur. But originally he was a painter, and a very productive one. He was a pupil of PAUL DELAROCHE, and was selected in 1855 with ROBERT FLEURY to repaint a large part of the "Hemicycle" in the theatre of the Ecole des Beaux-Arts, which was nearly destroyed by a fire. The Count painted some important works for the Versailles gallery, and many of the paintings in the chapels of the church of Sainte-Clotilde reveal his skill. It is difficult, however, to persuade the world that a Count can ever be more than a tyro in any of the arts. M. DELABORDE in the early days of the Empire was appointed conservator of prints in the Bibliothèque Nationale, and from the facilities at his command for obtaining evidence he soon became an authority on the lives of artists and on other subjects connected with art. A few years ago a long review of his memoir on EDELINCK appeared in this journal. On the death of M. BEULÉ in 1874 he was appointed secretary to the Académie des Beaux-Arts, and for that office he appeared to have peculiar aptitudes. For a quarter of a century he was the inspiring spirit of that section of the Institut, and his fitness as a functionary was shown by the dislike of the members to any change, although M. DELABORDE had long passed the usual age-limit of French officials. It is little more than a year since a new secretary was appointed. M. DELABORDE had attained his eighty-eighth year, but prior to his paralytic attack on last Christmas Day he could be considered as being a hale sexagenarian. He was the son of one of NAPOLEON'S generals.

THE late GUSTAVE MOREAU was an able painter who possessed some of the qualities of the English pre-Raphaelites, but on that account he never gained the favour of the French public. The fact that he left about 800 works in oils and 350 water-colours, besides some thousands of drawings, reveals his inability to meet the demands of the market. Some of his works are remarkable for their elaborate detail and their jewel-like colour, but his countrymen did not possess the patience needed for the study of works which could be scrutinised inch by inch. Like so many other men who were not sufficiently appreciated during their lives, MOREAU was confident that posterity would do him justice. In order that opportunities should not be wanted for the examination of his pictures he resolved to bequeath them and the atelier in which they were produced to the State, on condition that they were to be kept together for all time. A gift of a part of a building near St. Lazare entailing expenses for conservation, watching, lighting, &c., has, however, something of the proverbial white elephant about it. Ministers are bound to be sceptical, and where is the guarantee that future generations will prize works which were neglected by the artist's contemporaries? Posterity will have its own favourites, and may not be grateful to those who would insist on interference with its liberty. Then there is the awful reflection that the numerous artists who resembled MOREAU might also insist on the State becoming the guardian of their reputation. The existing French Government are burthened with an abundance of cares, and are to be excused if they are not anxious to add to them. Whatever is the reason, it is not yet decided whether MOREAU'S gift will be accepted, although people were confident that the exhibition of his works would before now be opened to the public. There are so many examples the rooms are not large enough to afford the needed wall space, and the painter adopted various ingenious arrangements to exhibit them, so much so that sceptics wonder he did not attach some of them to the ceilings. The work of half a century by a man of genius can be seen, but it requires patience and leisure to do the pictures justice. An artist in MOREAU'S position should be able to bequeath an endowment to reward those who by their visits will help to keep his memory green.

WE have already described the arrangements for celebrating the centenary of VELASQUEZ in Madrid from June 6 to June 11. The Spanish Ambassador wishes to have it made known that the Government, assisted by the Academy of Painters, will welcome all distinguished foreigners. Among the events will be the inauguration of the Velasquez Gallery at the National Museum and of a statue of the painter; an exhibition of all the paintings of GOYA that exist in Madrid; receptions organised by the Academy of the Fine Arts; the Museum of Modern Art and the recently-inaugurated Fine Art Exhibition. The Knights of the Order of Santiago, to which VELASQUEZ belonged, will celebrate on June 6 a solemn requiem service to his memory to the accompaniment of music of the great Spanish composers of the sixteenth century. At the theatres and academies performances and conferences worthy of the occasion will take place. At all the more important towns through which the line of rail passes to Madrid, viz. at Burgos, Avila, Salamanca and the Escurial, and also at Toledo, special arrangements have been made for visiting the famous churches, monasteries, museums and historical monuments, and the railway company has promised to co-operate in affording every facility to visitors who may desire to break their journey at the respective towns of interest.

THE British Ambassador and many French notabilities visited on last Friday the new premises of Messrs. WARING & GILLOW in Paris. The position was well chosen, for it is the corner of the Rue Gluck and the Boulevard Haussmann. Mr. CAULDWELL, an American painter, who has lived for several years in Paris, and is a constant exhibitor in the Salon, is responsible for the decoration, which is equal to what is found in the foremost establishments in the neighbourhood. The aim has been to exhibit English furniture of a superior quality; the premises are therefore laid out in such a way as to suggest an English house that is complete in its arrangements. The furniture is sumptuous, and recalls various styles, every article showing good taste. The growing demand for English furniture excited the interest of the late M. GALLAND, and was relied on by him to sustain his theory that in the arts the English were destined to be the dominant power. In the new premises Parisians can see furniture and decoration which will sustain the most severe criticism, and the English visitors who were present on Friday felt indebted to a firm that so well upheld the reputation of English work in varied forms.

FRENCH artists are now busy in considering the conditions of the competition for the design of the diploma which is to be issued in connection with the International Exhibition of 1900. The designs in the first competition are to be sent in before June 15, and those in the second before September 21. The jury will consist of twenty-one members, of whom eight will be selected by the competitors. It is anticipated that five of the competitors will take part in the second contest. The design selected will be rewarded with a prize of 10,000 francs, and the four artists who are not successful will each have 1,000 francs. The design for the last International Exhibition in Paris was the work of the late M. GALLAND, and M. PAUL BAUDRY designed its predecessor. Both were reproduced in *The Architect*.

THE tower and spire of St. George's Church, Liverpool, will be preserved. When it was decreed that the building must be removed, there was dissatisfaction expressed by some of the citizens, but the Corporation could not agree to the preservation of the church. Then it was proposed to preserve the tower and spire as a landmark, and to keep the rest of the site as an open space. After much discussion the Corporation agreed to a compromise by resolving to accept the site with or without the tower and spire. The final decision was left to the Bishop of LIVERPOOL. His lordship has considered it would be wise to preserve the tower and spire, and the Ecclesiastical Trustees will make arrangements accordingly. It is to be hoped the lower part of the memorial will be treated in a manner which will not compel people to regret that the bishop did not recommend the entire removal of the church.

THE COLUMN AND THE ARCH.*

SOME people who are endowed with curiosity and a faculty for counting amuse themselves by ascertaining the number of different words which authors employ. They have discovered that various writers contrive to fill many pages with the aid of a limited vocabulary. It is said there would be an end to the authorship of a great many individuals who claim to have a respectable standing in literature if they were prohibited from using one or two hundred ordinary words. In an architect's eyes the possession of a hundred elements as means to gain effect must seem a most happy state of affairs. He is compelled to devise structures out of far fewer elements, and yet the world expects that whatever he builds is to be marked not only by beauty but by novelty. Mr. LONGFELLOW, the American architect, has adopted a very simple title for his volume of essays, which suggests one of the peculiarities of architecture. What can be more commonplace than the two varieties of support? Yet they represent not only building construction, but the art of the architect. Let an architect be interdicted from introducing the column and the arch for ornamental purposes and what substitute could he find for them? The two were not always employed together. The Greeks were not disposed to admire the arch, and contrived to gain pleasing effects without its aid. Gothic pendentives and the attenuation of the visible means of support for vaults reveal a desire of Mediæval architects to impress people with a belief that arched forms did not need columns to keep them in position. In Moorish work we can see a similar desire. As a rule, however, arch and column were supposed to be of equal importance, and if not always conjoined, we know they are not far apart in a building. If it were illegal to use them architecture would become painfully monotonous, and as inexpressive as the writings of those luckless authors we have referred to after their familiar words were taken from them.

Modern investigations have falsified so many of the venerable traditions of architecture, it is hazardous to say that the column was derived from the wooden post used in a primitive hut, or the trunk of a tree which served instead. Nor is it possible to describe the evolutionary process to which the column was subjected with any certainty. Construction is, or should be, part of universal history, and that has a less firm basis than a fairy tale. All we know is that in Egypt we have the column in an advanced stage. But it is needless to say the more advanced is the more erroneous. Colossal as it was in height and girth and made of the toughest stone, by a strange perversity which has led to innumerable errors in the architecture of subsequent ages the Egyptian column was intended to express a relation to fragile plants. The difference between granite and a vegetable substance could not be realised by the builders. But we suppose we ought to be thankful to them for imitating things which grow near the Nile rather than the river itself. Another reason for respect is to be found in the treatment of the capitals, on which Mr. LONGFELLOW has the following observation:—

> It is the distinction of the Egyptian capitals among all others that they alone have no practical office, and this accords well with their floral origin. From the Greeks down, every capital has shown, besides the wish to mark the transition between the shaft and the beam or arch, which is the æsthetic office of every capital, a distinct structural effort to strengthen the junction of the shaft and its load. All other capitals expand where they take hold of the lintel or archivolt. They seem to show that the upper end of the shaft was liberally enlarged where it receives the charge, and then what material could be spared at the corners was cut away in ornamental forms to smooth the passage from the round shaft to the angular mass above. This is most manifest in those styles in which the shaft is slenderest in proportion to its load, as in the Saracenic and the Late Romanesque and thirteenth-century Gothic. But in the Egyptian, most ponderous of all, the precaution is absolutely neglected, or rather rejected, as if in commemoration of the dainty originals of their massive capitals. The architrave is ostentatiously lifted clear from the cap by a square block, which takes the place of the Classic abacus. Instead of expanding, the block is made as small as it can reasonably be; in the bell cap, or papyrus capital, and in the other spreading types, it is no wider than the top of the shaft; in the lobiform it is no larger than is necessary to receive the top of the bud, which may be even smaller than the shaft. So the stern Egyptian builder, who would not admit the arch among the elements of his severely straight-lined monuments, and hid away his vaults in the interior of his pyramids, would have no entangling alliance between decoration and construction, but uncompromisingly insisted on his great capitals as mere ornaments.

But was that evidence of good sense, to put a mere ornament in a position where an enormous weight came upon it? A lotus is a beautiful plant, but to denote that it could balance the upper part of a building on the tips of its leaves was an example of equilibration which none of the Egyptian conjurers would venture to rival.

Although the Greeks may have drawn inspiration from Egypt, their Doric column accords with rational æsthetics. It was capable to perform the office assigned to it by the builders. No doubt it was monotonous, but, on the other hand, it may have had associations in its favour of which we are ignorant. Greek legends were not all recorded, and for all we know to the contrary there were popular explanations of the fluting, necking and other characteristics of the order which were more impressive from their poetry than any theory of the architects. The stately rows of columns of uniform size and character must have appealed to the Greek mind as if they formed one of the institutions of the country. But Americans are not sentimentalists, and apply a prosy measure to antiquity. The Doric columns have a grandeur of their own, and European architects gladly testified to the skill of the masons who formed and laid the drums; but the Americans take a "practical" view, and will not allow themselves to be deceived by prepossessions derived from the Classics:—

> If we examine the Parthenon minutely (says Mr. Longfellow) we shall find that the delicately fitted joints in the columns are only wrought in a ring a few inches wide at the circumference, where the drums have been ground together like the neck of a bottle and its glass stopper, and that all the inner surface is cut away roughly so as to escape contact and leave the greater part of the joint open and hollow. So the great mass of the marble contributes less to the support of the heavy superstructure than the concrete filling of Roman walls or the rubbishy cores of the great columns of Rameses at Karnak. Worse than this, the magnificent spreading capitals of the Parthenon, that with their solid abacus and springing echinus assume to carry lightly the weight of the great entablature, gathering it in securely to the shaft, really do no work at all. Lest the finely wrought edges of the abacus should be damaged by any unequal pressure from the architrave, the weight of the entablature is taken by a shoulder or bench a fraction of an inch high, the scamillus of Vitruvius, which receives the architrave and carefully holds it up out of reach of the capital. This scamillus, a miniature of the die set visibly above the Egyptian capital, is so low that it could not be seen or inspected without a close examination made high up at the level of the abacus itself.

The Romans who claimed possession of a fine taste like the Greeks, could believe the column was all-sufficient as a constructive or decorative element. But the general feeling was in favour of the arch. Such a building as the temple at Nîmes (the Maison Carrée) was an exception, and it is infinitely less characteristic of the Roman treatment of buildings than the Colosseum, where the numerous arches were divided by engaged columns. The arch with the Romans supplied a necessity like the wrought-iron girder in this country, and gave an impetus to construction. As soon as it was found that railways could be carried over rivers, roads and valleys at any height or at any angle that was desired, new lines were projected everywhere in Great Britain, and in other countries there was also ardour to adopt the new system. The Romans had a weakness for the colossal, and the arch enabled them to extend buildings until they exceeded all precedents. Unit of arch and column was added to unit, and the projects which were announced in 1851, when it was discovered that Crystal Palaces could be constructed by attaching bay to bay and filling in the cast-iron framework with glass, may not have differed much from the experience of the Romans at the time of the building of the Colosseum. According to Mr. LONGFELLOW, "The modern degradation of the orders, by which two or three storeys are crowded under one of them, was not thought of till the Renaissance architects contrived it in their one-sided zeal to combine the spirit of Classi

* *The Column and the Arch.* Essays on architectural history. With illustrations. By William P. P. Longfellow. London: Sampson Low, Marston & Co., Ltd.

architecture with their necessities." If the Romans believed there would be more grandeur in a single order they would have adopted it. Their preference for the system of units made the arrangement of an order for each storey appear more becoming, and in such a building as the Colosseum the comparatively small columns are not without beauty. Afterwards the combination of arch and column was accepted as dictated in the nature of things, and by Roman influence was spread throughout the civilised world. The arrangement in Spalato which made the arch spring from the column enabled both to appear as one object and as inseparable.

The introduction of Christianity, although it altered so much in Rome and elsewhere, did not affect the architecture. The new religionists were not more eager to have beautiful places of worship than are the Salvationists of our time. When CONSTANTINE was gained over there was a change and churches became costly. In the eastern part of the empire experiments were made which prepared the way for the erection in Rome itself of buildings resembling the basilican churches which have survived. Mr. LONGFELLOW maintains that the cruciform church did not prevail in Rome until the Renaissance period. The Latin basilica was, he says, not a cross but a T, and "the relation of the two parts was very much like the head house and train house of a modern railway station." The arch was the "architectural mediator" between the two parts, and gave dignity to the part which was known as the chancel. But the colonnade was preferred to the arcade for the boundaries of the nave. The Church authorities were not able to keep up to the standard of style which CONSTANTINE inaugurated. In the declining days of the empire architectural needs were not of much moment. It was a victory to exist, and so long as the ecclesiastical organisation was not stifled under the weight of barbarian invaders the rulers were satisfied. They had also to consider the case of the infant churches in remote parts of the empire, and amidst the multiplicity of demands upon their attention they were to be pardoned if they were indifferent to purity of style. The responsibilities of Rome were so manifold, it is no wonder there was an evasion of an assumption of authority in many things. There never was a style of architecture which could claim to have an official character in the Roman Church. Liberty is allowed to revive or to cast down styles so long as the services in the varied buildings are not affected by the character of the building. But the pontiffs adhere to the combination of forms which was adopted in Rome when Christianity appeared in it, or to some variation of them. Renaissance extravagance consequently found favour in Rome, while the Gothic style, which elsewhere appeared to be as efficacious in promoting catholicity as an order of preachers was without any influence on the minds of the Popes. As a consequence Rome, although the capital of Christianity, does not represent the architectural developments which were one of the consequences of the religion. But if it is not a microcosm the mysterious old city is true to itself, a survival of antiquity which its new ædiles consider they are bound to Parisianise, in the hope that thereby they will prove themselves to be the successors of the antique Romans of the Republic. On the subject of Roman conservatism Mr. LONGFELLOW says :—

> Though in her helplessness she let the forms of the old architecture slip away from her, she took no further share in the new than to accept that one innovation of Constantine, the basilican arcade. As we look back over her history we see imaged in her architecture the same self-consistency, the same persistent individuality that marks her political endurance. All other cities whose architecture records their history show that they have been different cities at different times. In Rome alone that adherence to her old tradition which held her to a straight course in the time of Constantine is embodied in all her later aspects except for the vagaries of to-day. She is the one architecturally harmonious city in the world, as she is the oldest. She has claims to the forms of her architecture as she has to the traditions of her supremacy, and both are witnesses to the strange tenacity which has enabled her to assert her primacy through all ages, in spite of poverty, neglect, humiliation and all that would degrade another city. She is to us the symbol of stability, a symbol perhaps of indifference to that progressiveness which the world loves, often to the things that mean real advance in the condition of men, but also of a noble endurance of time and disaster, of a steadfast dignity which makes the nobility of later ages seem petty, and which has held the garment of her majesty about her—at least till our day.

In Rome and many parts of Italy it was to be expected that the ancient orderliness should prevail. Columns and arches were arranged in lines like soldiers on parade. A building like Speyer Cathedral would have shocked a Roman architect although he belonged to the period of decadence. To see the lines of an arcade laid out to correspond with the inclined lines of a gable, or with a semicircular plan ; to have three arches above two arches, and columns and arches introduced as if to gratify a whim, would appear to him to be destructive of that stateliness without which there could be no architecture. But the arch and column might have been considered as possessing mysterious powers, so constantly were they introduced in all possible positions. Look at the great arches of the mosque at Cordova, erected in the eighth century. They are not only used as arches in general, but some of them are intended to offer lateral resistance, and they are evidence of the extent to which the principle of the arch was understood at the time. At Pisa arcades were used like frescoes at a later time, as a beautiful veil for the walls. Mr. LONGFELLOW does not exaggerate when he says :—

> In the Romanesque the column was everywhere the builder's pet child. As soon as he acquired skill to make them easily for himself he abandoned the Classical stature and made them of various sizes, but chiefly small, reserving them mostly for decorative positions and leaving his hard work to be done by piers. It seemed that he never could accumulate enough to satisfy his desire. The belfry stage of the old tower of St. Front in Périgueux is a mere stockade of columns, with hardly room to pass one's arm between them. The façade of St. Maria della Pieve at Arezzo is covered by a throng of columns standing on shelves as if exposed for sale, and bearing small arcades, while the upper storey fairly disappears behind a fence of them, too thick-set to carry any arches at all. So fond of them the builder grew that he sought out and invented places to put them. He cut them in halves and set them up like buttresses against the walls of façades and apses, running them into cornices; he made nooks for them and set them fourfold, sixfold, tenfold, in the jambs of doors, where the early Christian builders had posted them as sentinels in pairs, like Jachin and Boaz in the porch of Solomon's temple; he thrust them into his windows for mullions; he cut out hollows to hold them in the angles of walls and buttresses.

The enthusiasm of the Mediævalists went further in their affection for the column and the arch. They believed the combination was universally applicable, and could be made appropriate in every position. Column and arch became the chief motif for decoration, and it is often charged against the artists that they were ignorant of any other method of filling a blank space than with a blind arcade. Mr. LONGFELLOW has, as he says, only lightly touched Gothic because it was *hors de ligne*, and was without a successor. But that would imply that the Roman arch and column was without influence, and that Gothic was an independent creation. To neither condition can we agree. As to Gothic having no successor, much of the work which is considered to be late Renaissance has as much claim to be considered as allied to Gothic. It may even be said there is similarity between the early and late examples of the Renaissance. BRUNELLESCHI, although he studied Roman remains with care, did not produce buildings which corresponded with his models. It is easy to see that he was not entirely emancipated from Mediæval and German influences. Mr. LONGFELLOW, who believes in a definite separation, has to admit that "the sense of the proportions on which Roman design was built was, to be sure, only partially awake in BRUNELLESCHI; his lean entablatures and starved orders, the baldness of his details, contrast notably with the freshness and nobility of his ideas and with their Classic intention." But intentions are not readily valued in architecture. ALBERTI was a book-man who aspired to be a legislator in art, rather than a great designer. He was able to express his ideas in words with more clearness than the majority of his contemporaries. He was accepted as an interpreter of VITRUVIUS, and therefore of ancient art. The people of the time were afraid of the risks of private judgment and were willing to trust ALBERTI. Mr. LONGFELLOW says he had a truly Classic reverence for the column and the entablature

"felt strongly the dignity and individuality of the order, and urged that while people of moderate station might be content with arcades, distinguished citizens should build their loggias with entablatures." As for BRAMANTE, "his earlier buildings, executed in the last quarter of the fifteenth century, show the traditions of the old style mingled with the new, or rather the details of the new engrafted on the forms of the old." ALBERTI gave a preference to a single order, and it was concluded that for so doing he was faithful to the Classic spirit of the best period. Attention was concentrated on that feature, and as a consequence a great order was supposed to be the essential principle of architecture, and so long as it was introduced deficiencies might be condoned. In the end the art became "a thing of arbitrary fashion instead of a natural product of the people —a thing whose form, progress and changes, instead of being a natural evolution, were now for the first time dictated from without by a company of self-elected rulers, of amateurs and dilettanti."

Mr. LONGFELLOW, in tracing the fortunes of the column and the arch, has given us a compendium of the history of architecture. His volume is further proof of the interest which the art has awakened in America. He does not write for technical students alone, but all who read the pages will derive advantage from the author's learning and experience.

TREASURE TROVE.

WHENEVER a clause relating to the surrendering of all antique objects found in excavations is introduced in conditions of contract it is accepted without the least demur. Contractors know that in the majority of cases remains of antiquity which have any value are not met with, and if any which are easily portable are turned up the labourers contrive to make away with them. That antiques will be forthcoming if amateurs are prepared to pay liberal prices for them may be assumed, for the relation between demand and supply is exemplified in archæology as in more common affairs. When the works of the Thames Embankment approached Blackfriars, there was a brisk trade in very rusty bronze figurines, but the navvies who so mysteriously and with so many precautions parted with them were aware they never came out of London earth. To some men they were familiar objects, for the same sort of traffic was engaged in while foreign railways were in course of construction.

There is, however, a stringent law on the subject of treasure trove, but the principal officers of the British Museum are not certain about its efficacy, and its aid is rarely invoked. It is admitted that the Crown has a superior title to any acquired by the Museum through purchase, that it would be possible for the Crown to assert such a title if so disposed, and that the trustees would on demand yield objects to the Crown, but the admissions are only theoretical and are never likely to be tested. The definition of Sir EDWARD COKE, although he was supposed to be almost infallible, will not sustain every test. According to him, "treasure trove is when any gold or silver in coin, plate or bullion hath been of ancient time hidden wheresoever it be found, whereof no person can prove any property." How, for instance, can evidence be forthcoming of the "hiding"? A few years ago a labourer in hoeing revealed a gold ring. It was claimed by the lady of the manor, and when she obtained it she gave it to the clergyman of the parish. A superintendent of police heard of it and demanded it as treasure trove. The clergyman, without disputing the right of the Crown, sent it to the Treasury. Counsels' opinion was sought, and Sir ROBERT FINLAY and Mr. G. H. BLAKESLEY stated, "We are of opinion that the ring could not, under the circumstances, be rightly called treasure trove, because it does not appear to have been placed where it was found by any person desirous of hiding it. According to the authorities there must be presumptive evidence of hiding in order to bring an object under the claim of the Crown as treasure trove." Many a navvy would say there was no need to apply to distinguished lawyers for that advice, inasmuch as he always acted on the principle and found it succeeded. Where is evidence to be found of intentional concealment of a little bronze figure, a sword or a brooch that would be urgent enough to satisfy an ordinary juryman? There are occasions when "coin, plate or bullion" will appear, and then there are fewer doubts about treasure trove. Every one who has been long connected with building has heard legends of labourers who suddenly develop into contractors or property owners, and the explanation offered is that they were fortunate in finding a "crock of gold" or other valuable deposit. The majority of such cases would come under COKE's definition. The counsel already mentioned informed the Government that "in most cases the circumstances of the finding must be the sole basis of any presumption of hiding; as, for instance, if a number of articles are found collected together in a vase or buried in a manner inconsistent with their having got into their position through an accident." To prove treasure trove is therefore not as easy a task as is commonly imagined, and it is no wonder there are so few cases brought to light.

In Ireland extraordinary precautions have been adopted to insure that all antique objects found below the soil shall not remain in the possession of individuals. The whole constabulary force throughout the country can be considered as archæological agents and guardians. In 1861 a notice was issued promising payment to finders of ancient coins, gold or silver ornaments or other relics of antiquity if delivered to any member of the force. The value of the articles is to be ascertained by some competent person, usually the Council of the Royal Irish Academy, and if the articles are not accepted they are to be returned free of expense to whoever sent them. Yet it is a notorious fact that a collection of valuable gold objects, consisting of a collar with repoussé ornament, a model of a boat, a bowl with rings, a torc, a necklace of three chains, a single chain necklace and half a torc, was three years ago found in the north-west of Ireland, was sold to a jeweller in Belfast, was purchased by an Irish archæologist, was exhibited at a meeting of the Society of Antiquaries in London, and until an abstract of the paper read on the occasion was published the whole army of guardians of antiquities in Ireland were ignorant of the discovery. The civilians believed that not even a fragment of a flint or a small pin could be found without the knowledge of the ubiquitous constabulary, and the latter professed to be incompetent to meddle with subjects unless they were set in motion by legal machinery. The lawyers declined to turn on motive power unless full particulars were furnished. Circumlocution required an age to act, and when it attempted to do something it was too late, for the British Museum had secured the treasure by promptly paying 600*l.* Then there was the usual lamentation about injustice to Ireland and the sharp practice of the British Museum. But if the Bloomsbury men had not exhibited their customary alertness the collection might have gone to America or to one of the Continental museums. In a country like Ireland it is not always advantageous that archæology should be associated with the system of police, for the people will naturally be afraid to have their dealings with that body misinterpreted. A bringer of antique objects could easily be transformed into a spy or an informer, and the risks which would follow are not to be despised. It will be said the constabulary are only intermediaries between the Royal Irish Academy and the people, but the only effect is to make the archæological body suspected. What, however, is more of an obstacle to the securing of antique objects is that legally the bullion value only need be paid for them in Ireland. The sum that is available for the purchase of treasure trove is only 100*l.* a year. As a consequence prices must be kept low. The bullion value of the objects for which the British Museum paid the 600*l.* was between 70*l.* and 80*l.* The Irish Academy under no circumstances would have given more than 250*l.* for them, and if the possessor were a poor man a semi-inquisitionary power would be invoked, his fear would be operated on, and he should be very grateful if he received 100*l.* As long, therefore, as the full market value of antiquities is not obtainable from officials, it cannot be expected that the Dublin Museum will be enriched. It is true that in the cases there are at present more valuable objects than are to be seen elsewhere. The prehistoric antiquities in gold weigh more than 570 ounces, while it is doubtful whether the British Museum possesses 100 ounces. But the majority of the gold objects were secured by the Irish

Academy prior to the time of transforming policemen into archæologists.

In Scotland the regulations about treasure trove are more unsatisfactory. All articles found, the owners of which are unknown, become Crown property, according to the old maxim, "Quod nullius est, fit domini Regis." To conceal an object obtained in that way is severely punishable. Not only things which arise in excavations, but all waifs and strays have to be accounted for, unless the proprietor of the land where they are found has a special grant which gives him a right to them. At present there is not always a rigorous enforcement of the law, but it is well to remember that only forty years have passed since the Crown exercised its claims, and that objects were seized without the payment of any compensation to the finders. It is needless to say that very few objects escaped melting, for the feudal principle in Scotland, although interesting in theory, is not expected to impose financial sacrifices. In 1859 it was announced that the actual or intrinsic value would henceforth be paid. But it is still a fact that in Scotland finders do not in general receive the recompense which they consider should be theirs, while landed proprietors and others contrive to obtain large sums of money by the sale of antiquarian objects to which they have no legal right, for the objects were often deposited with them for safety.

It is time that a more satisfactory system of dealing with treasure trove should be adopted in this country. Cunning traders and agents contrive to get bargains by making a finder believe that he has rendered himself liable to heavy penalties through neglecting to immediately inform the authorities of his discovery. Convictions are difficult to secure, for, as we have said, lawyers consider there must be presumptive evidence of hiding to make an object appear as treasure trove. But a judge may easily be satisfied on that point. The case of the QUEEN *v.* WILLETT, which was tried in 1863, shows that objects which were bought as brass for 5*s.* and sold to a jeweller for 500*l.* entailed a fine of 250*l.* each on two men and imprisonment until the money was paid for unlawfully concealing treasure trove. Since 1863 a different view may be adopted, but in law what has happened once may happen again, and a contractor or anybody who retained treasure trove might find himself in an uncomfortable position. At all events the risk is utilised by men who are anxious to secure antiques from the finders. What is needed is a nearer approach to the Danish system. In Denmark the right to treasure trove belongs to the Crown, but care is taken to have it known throughout the country that the State will not only pay a more liberal price for objects than can be obtained from individuals, but any trouble taken to collect and preserve those objects is remunerated. The liberality has in a comparatively short time made the National Museum in Copenhagen one of the most interesting in Europe. The funds for purchase of antiquities are obtained from an annual grant, which is supplemented by the property derived from those who have died intestate and have no known relations.

SLYFIELD AND STOKE D'ABERNON.

THE summer excursions of the members of the Upper Norwood Athenæum began with a visit to the manors of Slyfield and Stoke D'Abernon. By the kindness of Mr. L. W. North Hickley the members were permitted to visit Slyfield manor-house, to which on a previous occasion Mr. Quartermain had conducted them. Here the carved woodwork and the ornamental plaster ceilings were admired, and from the private grounds an uninterrupted view of the picturesque mansion was obtained. A brief walk and Stoke D'Abernon was reached, which for nearly two and a half centuries was continually changing owners, through the lack of a heir male. But when Thomas Vincent came into possession, Queen Elizabeth visited the manor-house and knighted the owner, to whom a son was born, and the name of Vincent was carried on. The beautiful church of St. Mary the Virgin, now encircled by the manor grounds, had been carefully examined by Mr. Wheeler, and in it every object of interest was pointed out. The wonderfully preserved brasses, the interesting oak-chest, the wrought-iron hour-glass stand, the monuments to the D'Abernons and other owners of the manor, the old heraldic windows, and the recent ones dedicated to the memory of Bishop Sumner and Bishop Wilberforce received notice in turn. The following paper was read by Mr. Charles Wheeler :—

Slyfield and Stoke D'Abernon.

Leaving Leatherhead station, we at once strike a footpath past an old water-mill, now modernised; this formerly was one of the many worked by the water of the Mole. In mentioning this, the Mole was so celebrated from our earliest times that in Domesday Book as many as twenty are mentioned as being in work there; in fact, it is an oft-disputed point whether the word Mole is not derived from the Latin mola, a mill, from there being so many in its course; but of that I will treat later. We here leave both mill and Mole and continue through the purest of country, never once touching a main road; here and again a country lane only, then through a well-kept farmyard, finally having to finish with a newly-ploughed field till we reach the historical Slyfield Manor. I may here mention that the whole of my ramble has been done by our Society before on more than one occasion, and refer you for any historical facts not found in my paper to those of previous leaders. I put only that which they leave out, and of that not much, I fear.

Slyfield House, that portion now remaining, dates from about the year 1620, and previous to that date there was doubtless a much larger building.

In the church of Great Bookham there are memorials of divers kinds to the occupants of Slyfield, thus giving a running history of the various owners from time to time. They seem to have held important positions in the county, and one inscription in particular I think is worth quoting :—

Of Slyfield Place, in Surrey solle, here Edmund Slyfield lies,
A Stout Esqvier, who allweys sett Godes feare before hys eyes;
A Justice of the Peace he was from the syxt Kynge Edward's daye,
And wortheley for vertves vse dyd wyn deserved praise.
He toke Elyzabethe to wyfe—a dame of famous rase—
She of the Pauletts dyd dissend, and Capells in lyke case;
Of Sydney's stocke she was a bravnche, and to thee Gaynsford's nye,
Dame natvre to the gentell Moyles and Finches dyd her tye;
To Arundels, Whites, and Lamberts each by byrths' descent she was—
And he with her and she with hym thaire dayes in love dyd pass.
In Wedlock she brought forth to hym 5 sones and daughters 2,
Which carefullye she dyd instruk to serve the God in heaven.
He in the xiiii. yere of Elizabeth our qvene,
Whose vertues through the world do spring as fresh as lawrell greene,
At seventy one with odd months too she seventy years has spent.
His tyme is past, her tyme draws on, &c., &c.

After having inspected the interior by the courtesy of Mr. L. W. North Hickley we cross the Mole by an iron bridge, 1805, and stroll along one of the most charming spots in Surrey, well cultivated land on the right gently rising in the direction of Randall's Park, and on the left the banks of the river, which, with your permission, I should like again to mention, for here at this most lovely spot it may well be spoken of as "silent," for never have I seen it throughout its whole course more silent and beautiful. On the right you have the venerable pile of that grand old church of Stoke D'Abernon, the Rectory house, so historically connected, nestling amongst the trees, the splendidly-kept lawns sloping down to its banks.

Spenser in his "Marriage of the Thames and Medway," writes :—

> And Mole, that like a mousling mole, doth make
> His way still underground till Thames he overtake.

Drayton speaks in harmony of its union with the Thames :—

> 'Gainst Hampton Court he meets the soft and gentle Mole;
> But Thames would hardly on, oft turning back to show
> From his much-loved Mole how loth he was to go.
> The mother of the Mole, old Holmesdale, likewise bears
> The affection of her child as ill as they do theirs.

The river itself has its source in Tilgate Forest, near Worth and Rusper in Sussex.

I mentioned just now the question of the origination of the name. Well, many think and most favour the opinion that it is so called on account of its burrowing propensities, for during a dry summer it frequently disappears and makes its way underground between Leatherhead and Boxhill, rising again to the surface further on. This is caused by the cavernous nature of the chalk and gravel of its bed. After passing Esher it divides into two branches—one near Thames Ditton and the other flows towards Molesey Hurst. Its union with the Thames at Hampton Court (which lies on the opposite bank) makes a grand finish to its career. And now back again to Stoke D'Abernon, where we enter the church. On the occasion of the last visit the Society was honoured by the company of Mr. Mill Stephenson, hon. secretary Surrey Archæological Society, who himself read the paper from which I cull the following facts in brief :—That the manor of Stoke, Stock or Stocke, signifying a place, came into the possession of the D'Abernons family in the reign of William the Conqueror may be inferred from an inscription in the church, in which it states that Sir William Dawbernon, whose daughter and heiress married Sir William Crosyer, was descended from that Dawburnon, the Norman, which came into England with William the Conqueror, and from whom this manor did descend to the same Sir William. To make a big skip, it was bought in 1776 by a London bookseller named Paul Valliant,

of the Strand. He died in 1802 at the age of eighty-seven, and in the following year, when sold, it was described as a neat house. Thirty acres of land and the great and small tithes of the parish were bought by a member of the great Smith family, and are now vested in the Rev. Hugh Smith, M.A., who resides in the village.

The church is mentioned in Domesday Book, and is dedicated to the Virgin Mary. The chantry chapel, running parallel with the chancel, was built by Sir T. Norbury (whose surcoat we were privileged to see) in the reign of Henry VII. The church contains the following among other monuments :—Recumbent figure Lady Vincent, on front of tomb five sons and two daughters, in relief (1608); kneeling effigy, in armour, of Sir John Norbury (1633); Sir Thomas Vincent, who was knighted by Elizabeth on her visit to Stoke (1613); and Jane, his wife (1619). In the east window in stained-glass are shields of the arms of the different families which have in succession been in possession of the manor since the Conquest.

Now brasses serve a very useful purpose as showing the progress of armoury for a man, as some of us have watched it in our ships, from the wooden walls of old England to the present modern battleship. It commenced first with the mail suit as seen to-day in that of Sir J. D'Abernon, date 1277, the earliest known brass in England; from unmixed mail we go to plate and mail, or mail and leather; then mail and plates, with coats-of-arms, as in the time of Richard III.; then to steel. Every plate added in process of time was with the hopes of strengthening the defensive equipment against the shock of the attack in battle or in jousts and tournaments, always keeping in mind to leave the sword arm free without lessening its security.

If one takes the brasses in the country in the various reigns they suggest exactly the armour worn by the knights of England, and is, as it were, unintentionally a history of the armoury of the various periods, and these can be verified or confirmed by comparison with the stained-glass we have and various effigies. Of course, in the figures in either case no attempt is made at portraiture; as you will have noticed they all bear a stray resemblance one to the other, save the difference of sex, age or youth, but the costumes of the women and the armour of the men are true to the age they were worn in, for these brasses were invariably produced immediately after the decease of the individual—indeed in some cases they were executed under the supervision of and during the lifetime of the individual, the spaces being left for dates. These, in some instances, have never been filled in. Another peculiar feature is that where the husband predeceased the wife the figures are engraved hand in hand, and in one case, where a man married a second time, he has hold of the second wife's hand with his left, but his right, the side on which the figure of the first wife lies, rests upon his sword hilt. The conclusion one forms is (1) not done during his lifetime; (2) predeceased his second wife.

The other day a prominent public man spoke somewhat strongly and disparagingly of the present-day woman, who copies the present male attire in its various forms, details of which I need not give; but this is no new thing, for there were new women in the good old days; a marked similarity between the costume of the two sexes is observable. The knightly coif of mail is imitated by the wimple of the dame; again both wore flowing mantles. The men had arms and mottoes graved on breastplate, ladies their dresses embroidered with heraldic adornments. One brass at Enfield to Lady Tiploft has a mantle with three great lions passant on one half, and on the other half another lion rampant, at least as large as the other three.

Speaking of Sir John D'Abernon, there is a curious story told of a suit instituted against him as Sheriff of Surrey, 1269. It appears that in 1265 William Hod, of Normandy, shipped to Portsmouth ten hogsheads of woad. These were seized by robbers at Portsmouth, and carried off to Guildford. William, surnamed Hod, overtook them, got his property, and sent it to the castle; then a Mr. Picard, of Normandy, claimed the property, and threatened if it were not given up he would destroy the town of Guildford by fire. The Under-Sheriff, who resided there, and who had property and also a wife and family, thought discretion the better part, &c., gave up the goods, which were again carried off, this time successfully. The action against Sir John as Sheriff was rather costly to him, for he was fined 80*l.* damages; this really meant, according to present value of money, about 900*l.*

When one hears of the honour of knighthood being conferred on some lesser city magnate of the present day for something he has or ought to have done, one naturally feels that the individual gladly welcomes the distinction. Not so when Sir J. D'Abernon was knighted, for we find that in 1277 Edward I. sent to all sheriffs, stating that those whom he had knighted were to pay their 20*l.* fee, failing which they were to distrain. Fortunately our Sir John was not a defaulter, and not only paid but accepted the extra duties entailed of coroner and juryman to the great assize, but many a poorer military knight evaded the honour.

Again on the march through winding lanes till we reach the deer park of Mr. Rucker, through which we avail ourselves of the right-of-way. The house is very modern and doubtless beautiful, but does not attract us as the one just seen. The most one can say is there is a great display of wealth; in fact, the deer do not seem at home penned in as they are, and it occurred to me it was more like keeping fowls than a deer park, after what we have seen at Eridge, Knole and Penshurst. Here we take the main road for a short distance and then enter Randall's or Henderson's Park, where we finish our delightful stroll into Leatherhead.

My difficulty has been not to recapitulate any of my predecessors, and at the same time make my paper somewhat interesting, a very difficult task. I undertook it for one purpose only, to attempt to show that it is possible to revisit old haunts with new life and new matter.

TESSERÆ.

The Square Abacus at Chichester.

IT is not a little remarkable that at a period when the First-Pointed style was, at least in Chichester, in other respects so advanced, this decidedly Romanesque feature should have been retained, and so retained as to be a ruling element in the composition of the entire cathedral. Nor is the feature confined to the exterior of the cathedral; only in the interior it enjoys, singularly enough, a divided empire with the circular abacus. In the same work of the self-same Bishop Seffrid II., who is believed to have completed and dedicated the restored cathedral in 1199, occur the round and the square abacus in the most friendly juxtaposition—as, *e.g.* in the triforium of the choir. This would seem to indicate that the interior was finished somewhat later than the exterior. The same balancing between the square or chamfered and the round occurs in the coeval conventual church of Boxgrove, near Chichester; the square or chamfered only, we believe (but evidently from the same hand), at Warblington, near Havant In the late Romanesque chancel arch of Bosham, also in Sussex, the abacus is very peculiar, being in a manner double, or consisting of two members—the upper square, the lower circular, with the usual "cushion" below. One could almost imagine the ambiguous character of this feature, in the neighbouring churches of the next succeeding style, to have flowed, as from a well-head, from this curious specimen, containing as it does the two characters in one.

The Temples of Agrigentum.

Most of the temples of Agrigentum present but a confused mass of mutilated blocks and fragments piled together; this is especially the case with the Temple of Hercules and that of Castor and Pollux; so confused a heap have they become that it is impossible to define their plan on a mere superficial inspection. Some of the blocks thus piled together are of colossal dimensions. Even at the small Temple of Proserpina is a block 8 feet 6 inches by 3 feet 10½ inches by 2 feet 10 inches, weighing therefore 5 or 6 tons. Indeed there are, when viewing these stupendous ruins, few things that excite more surprise in the mind of the architectural observer than the wonderful solidity of the mode of building practised by these Greeks. It is not flattering to contemplate the wide difference of practice in this respect between the builders of the sixth century before and the nineteenth century after the Christian era. It was a saying of Plato, as reported by Ælian, "that the people of Agrigentum built as if they were to live for ever, and feasted as if they were always about to die." Ælian goes on to say that "Timæus reports that they use oil-flasks and strigils of silver, and had entire couches of ivory." It should not, however, be overlooked that the contrast between the domestic architecture of the Greeks and that of our present generation would probably have gone far to redress the balance, if the Greeks had left behind them any adequate means of comparison. The temples of Juno and Concord are the least mutilated, and in their ruin present most beautiful and picturesque objects. The Temple of Jupiter is the most remarkable both for its magnificent size, with the flutes of its columns 14 inches wide, and for the singular example it offers of the use of caryatids in interior temple architecture. These caryatids were built up in courses like columns, and are about 25 feet high and 6 feet across the hips. There had been also found portions of nine other similar statues. An idea of the huge proportions of this temple may be gathered from the fact that the diameter of the columns of the peristyle is considerably more than half as great as that of the Monument in London.

Tomb of William de Valence.

Next to the Italian tombs in Westminster Abbey, one of the most interesting is that of William de Valence. We may fairly set it down as a French work, and probably executed by an artist from Limoges, though the custom of referring all

enamel works to that particular seat of the art is not borne out by facts. Indeed, it would appear from the old accounts that enamels for the shrine of the Confessor were executed here, whether by an artist from Limoges is unknown, though we know that one was employed in England shortly afterwards. The execution of these enamels is truly exquisite, so much so that it is only by the closest examination that any idea can be formed of the wonderful delicacy of the workmanship. The monument was thus described by Keepe in 1683 :—"A wainscot chest covered over with plates of brass richly enamelled, and thereon the image of De Valence, Earl of Pembroke, with a deep shield on his left arm, in a coat of mail with a surcoat, all of the same enamelled brass, gilt with gold, and beset with the arms of Valence, &c. . . . Round about the inner ledge of this tomb is most of the epitaph remaining in the ancient Saxon letters, and the rest of the chest covered with brass, wrought in the form of lozenges, each lozenge containing either the arms of England or of Valence, alternately placed one after the other, enamelled with their colours. Round this chest have been thirty little brazen images, some of them still remaining, twelve on each side and three at each end, divided by central arches that serve as niches to enclose them; and on the outward ledge, at the foot of each of these images, is placed a coat of arms in brass enamelled with the colours." Since this time the greater part of what is above described has disappeared, showing that the spoliation of the abbey is not generally chargeable against the rebels, but has gone on in modern times during the contemptuous dominion of Classic taste.

Piscinas.

The different purposes which have been assigned to the piscinas of altars by ecclesiologists are chiefly these :—(1) The washing of the priest's hands directly ; (2) the pouring away of the water in which the priest has washed, supposing him to have washed in a basin ; (3) the pouring away of the water with which the chalice was rinsed after communion ; (4) the pouring away of other substances—on occasions such as may occur to the reader without our specifying them—which reverence and decency did not suffer to be thrown into a common place. Now for all these several purposes have piscinas at one time or other and in one place or other been used, and probably at no time and no place have they been used for any one of these purposes exclusively. But no general assertion should be made respecting the uses of piscinas, without distinctions and qualifications. There are piscinas near altars and piscinas where altars have never been, not to mention the piscinas of sacristies, where there may have been altars or may not. Again a distinction must be made between the piscinas of the principal altar, or perhaps altars, of a large church and those of its minor altars, and between those again of the principal altars of large churches and of small. Distinctions of period may sometimes be necessary, and perhaps distinctions of country, if only we distinguish between the piscina or piscinas of the principal altar of a church and the piscinas of its minor altars. Of the piscina of a minor altar we might, we believe, say with safety that its principal and most usual purpose was the washing of the priest's hands ; of the piscina or piscinas of the principal altar we conceive it should be said rather that it or they were meant to serve for the ablution of the hands, either of the priest or some of the ministri, or of both priest and ministers, as well as for such incidental purposes as might from time to time arise ; for anciently in solemn celebration the ministers as well as the priests washed before handling the sacred vessels, &c., and not unfrequently a movable basin, bacile, pelvis or pelvicula was used for the washing of the priest's hands in celebrating *solemniter*.

Lucian on Polychromy.

Lucian, who died when ninety years of age, in the 180th of the Christian era, although he relinquished the employment of a statuary and followed that of literature, had certainly an excellent taste in art. His descriptions of statues and pictures prove his fondness and his knowledge. What he says of the famous Cnidian Venus of Praxiteles is very remarkable. After admiring the whiteness of the marble and its polish, he praises the ingenuity of the artificer in so contriving the statue as to bring least in sight a blemish in the marble (a very common thing, he adds). It would not have required this ingenuity in the designs if Praxiteles had intended his statue to be painted, for the paint would have covered the stain in the marble wherever placed. We may learn something more from Lucian. In his "Images," wishing to describe a perfect woman, he will first represent her by the finest statues in the world, selecting the beauties of each. It is in a dialogue with Lycinus and Polystratus. "Is there anything wanting ?" asks Polystratus, after mention of these perfect statues. Lycinus replies that the colouring is wanting. He therefore brings to his description the most beautiful works of the best painters. Enough is not done yet ; there is the mind to be added. He therefore calls in the poets. Here, then, we have statuary, painter and poet, each by their separate art to portray this perfect woman. He does not describe by painted statues but by pictures. Had painting statues been universal, as pretended, Lucian must have seen examples, and his reference to pictures would have been unnecessary. If it be argued that the paint had worn off, that argument will tell against the polychromatists, for it at least will show that, in an age when statues were esteemed, the barbarity of colouring was not renewed. In his "Description of a House," he says, "Over against the door, upon the wall, there is the Temple of Minerva in relief, where you may see the goddess in white marble, without her accoutrements of war." The painter, it may be fairly conjectured, painted inside on the wall of the house the common aspect, and the white marble statue. In his "Baths of Hippias" he mentions "two noble pieces of antiquity in marble of Health and Æsculapius." Nor does he omit noticing paint, and that vermilion—but where is it ? "Then you come to a hot passage of Numidian stone, that brings you to the last apartment, glittering with a bright vermilion, bordering on purple."

Ostade and Teniers

Ostade, in his compositions, displays such an ingenuity in their construction as to render his figures an endless source of gratification and study to the artist. In some of his works the artist is so completely hid that it is difficult to say whether his background or figures were first composed. We have not only objects intercepting each other in the most natural and picturesque manner, but the figures carried up against them, thus coming in contact with various forms, different in size, distance and colour. This, when done with judgment, gives a rich and inartificial effect. On the contrary, in the pictures of Teniers we often find a number of objects cast down in one corner, evidently for the mere purpose of being painted, which, however, from their situation, their picturesque arrangement and the mechanical skill of the execution, acquire a force, natural sharpness and beauty that amply compensate for the ostentatious display of such excellences. Teniers's backgrounds are also totally different from Ostade's principle, his figures being generally surrounded with blank spaces of shadow or half tint. When a story is to be told that requires the spectator to be directed to the heads and hands for expression and action, this breadth is more allowable ; but breadth, as Fuseli justly observes, "ought never to have the appearance of flatness or insipidity." It is observable that in an exhibition where there are a number of objects to distract the attention, those pictures please us most on which the eye is allowed to rest, from their possessing a vacant space ; but those very pictures uniformly look blank and unfurnished when hung up singly in a room.

The South Stack Lighthouse.

The tower is a substantial stone building with walls at the lower part 5 feet thick, but, solid as was this foundation, it was found on trial not to be sufficiently dense to keep out the pelting of the winter gales, when the waves bursting upwards dashed their spray with such inconceivable force that the water actually filtered through and kept the interior in a constant state of moisture, so much so as to excite an apprehension that it might seriously injure the masonry. A variety of remedies were suggested, and the most experienced opinions taken ; copper bolts were inserted, on which a casing was to be made fast. Persons were despatched from London with a mixture of pulverised iron, Parker's cement, ashes and sand. With this composition every crevice and interstice was carefully filled, and the whole smoothed down to an uniform surface, which set and became firm as stone itself ; but all to no purpose, for to the general astonishment water was still forced through, and the interior walls were as damp and trickling as ever. Captain Evans went to London and reported the case to the Trinity House Board ; small slates were then recommended as an additional casing, but the blast of the first hurricane ripped them away like shreds. In this dilemma, when, in the multitude of counsellors, no wisdom had been found, an old carpenter employed in repairing a window-frame and door-case, which he knew to have been set up above forty years, at a mansion house in the neighbourhood, remarked that every part of the casing below ground was in a state of decay, whereas the other parts, which had been coated with a mixture of painting oil, white lead and sand, remained as sound as ever. Happening at this juncture to meet Captain Evans he mentioned the fact, which thus accidentally suggested a similar application at the lighthouse. Accordingly a mixture was prepared, consisting of sand from Port Davaich, free from seawater, which, after being thoroughly dried in an oven, was well sifted. Two men were then employed to paint as far as they could reach with a mixture of white lead and oil ; and then over this glutinous surface the sand was dashed on and left to dry and harden for five or six days, after which the process was repeated ; when, to the surprise of all, two coats were found fully to answer the purpose, for since that time the water has been effectually excluded, not a drop of moisture ever penetrating within.

NOTES AND COMMENTS.

ANOTHER memorial signed by peers, members of Parliament, amateurs, critics and others has been sent to the Dean and Chapter of St. Paul's. The signatories say:—"In view of the dissatisfaction felt in many quarters at the decorations now being executed in St. Paul's Cathedral, we desire to appeal most earnestly to the Dean and Chapter, as trustees of this great national monument, that before proceeding further with the work they would take the opinion of a strong representative body of experts as to the desirability of the character of the decorations." Canon SCOTT-HOLLAND says that criticism has arrived in every possible shape and from every conceivable quarter. Memorials, protests, appeals, letters of advice and of abuse have been received by the decoration committee, and he thinks there may now be a cessation of the documents. "We are doing," he says, "our best to give all that has been said the consideration that it deserves. As soon as conclusions are reached we propose to make them publicly known. But, as Sir W. RICHMOND is still detained in Spain by severe illness, there must be a little delay. And it takes time to sift and weigh the worth of all that has been laid before us and to arrive at a clear judgment in so perilous and responsible a matter. For this we need some relief now from the storm of attack, some breathing space for reflection. It is hopeless to arrive at a sane result if we are to be still bombarded with memorials, which can only repeat what we have heard, and worried by the intemperate invective of excited young persons in the South Kensington Schools." But the decoration committee should not forget that for a long period gentle remonstrances were treated with indifference. If there is now an absence of measure in the criticism the reason is to be found in what was the apparent theory of the authorities, viz. that all who had not subscribed liberally towards the cost of depriving the cathedral of its architectural character had no right to express an opinion on the misdoings of the committee and their agents. The decoration committee have, however, resolved that the stencilling should be removed, and that it was desirable, before proceeding to do so, to see what would be the best mode of finishing the arches by completing the south-west dome without any decoration of the flat stone work. The execution of the panels in the fourth quarter dome will also be postponed.

AT first sight it may appear strange to have the memory of so practical a civil engineer as the late M. ALPHAND upheld by a series of fêtes. But the lieutenant of Baron HAUSSMANN and the trusted director of the municipal works would not have desired a different sort of commemoration. M. ALPHAND endeavoured to make Paris more beautiful than it was when he was entrusted with the care of its amenity, but he knew that his efforts could at most only supply the frame for the picture; the joyous figures could not be created by his formulas. The ALPHAND Committee have arranged the programme for the fêtes which are to be given in Paris from June 12 to June 17. The Tuileries, the garden of the Palais-Royal, the park of Vincennes, and the Bois de Boulogne are to be utilised for battles of flowers, kermesses, processions, competitions, &c. The most interesting feature will be the historic cortège which is to traverse Paris during two days. It will celebrate ETIENNE MARCEL, the Provost of Paris, and the guilds and corporations. M. EDOUARD DETAILLE has undertaken the arrangements, and will, of course, design the costumes. From his genius it can be assumed that Paris will on this occasion be able to compete with Brussels and Antwerp, where cortèges have acquired an archæological and artistic interest which would amaze the circus proprietors who manage such processions in this country.

THE report of the Liverpool Architectural Society states that during the session there were five members' meetings and seven ordinary meetings. On two out of the five members' evenings papers were read by strangers, and as regards the seven ordinary meetings held, on only one occasion was a paper contributed by a member of the Society. Excluding the President's addresses, nine evenings remain on which papers were read, only four of which were contributed by members. This, according to the report, can hardly be considered quite satisfactory. A society of the standing of the Liverpool Architectural Society ought not to be so dependent on assistance from outside. There must be many within its ranks well capable of reading papers, and the Council hope that these gentlemen will come forward more generously than they have done in the past and give other members of the Society the benefit of their knowledge and experience. An appeal is also made by the Council to the younger members of the Society to read papers on the members' evenings.

NEWPORT AND MONMOUTHSHIRE HOSPITAL, CARDIFF ROAD, NEWPORT.

THIS hospital, now in course of erection, provides for 84 beds in all, and is capable of enlargement to 120 beds. The administrative block is placed in the centre, and the wards are connected thereto by corridors 10 feet wide. An hydraulic lift is provided to carry patients to each floor. In connection with each ward is an isolation ward, day-room, kitchen, bathrooms, with stores. The out-patients' department is quite a distinct building, yet connected for the convenience of the medical staff with the hospital. The boiler-house, laundries, post-mortem room, mortuary, &c., are placed in the rear of the building. The site is a very fair one. The builders are Messrs. A. G. MORGAN & Co., and the architect Mr. RICHARD J. LOVELL, 46 Queen Victoria Street, E.C. The original drawing of the hospital is in this year's Academy.

JUBILEE MEMORIAL HALL, SINGAPORE.

WE give this week the front elevation of the selected design for a town hall and theatre to be erected at Singapore in commemoration of the Diamond Jubilee of our gracious Sovereign. In 1897 a public meeting was held at Singapore, and a committee was formed consisting of the Colonial Secretary and the Colonial Engineer as nominees of the Government, two members of the Municipal Committee, and two of the private residents, and it was agreed that one-third of the cost of the building should be raised by public subscription, the remaining two-thirds being promised in equal shares by the Government and Municipality.

In 1898 the committee invited architects from England, China, India and Australia to submit plans for competition, and the first prize was awarded to Messrs. SILLS & FRANCKEN, of Donington House, Norfolk Street, London.

In March 1899 the committee selected a site offered to them by the Government on Fort Canning Hill, and by the *Straits Times* of March 13 we see that the work of clearing and levelling the site will be begun at once.

The total length of the building, exclusive of carriage porches, is 345 feet, the width 133 feet, and the height to ridge of roof is 75 feet, and to top of clock tower 127 feet. The cost will be about 33,000*l*.

The building will face north-east. The town hall is to the left, the main entrance being under the clock tower.

The theatre is to the right and the entrance to the auditorium is at the end of the building. The town hall wing has on the ground-floor a supper-room, secretary's office, card, refreshment and smoke-rooms, and the necessary offices. On the first-floor is the ballroom, 113 feet by 50 feet, a card-room and retiring-rooms. On the second floor are terraces, store-rooms, a smoke-room and an electric accumulator room for working lifts, ventilating-fans and lights. The dynamos are placed in a separate building in the grounds. The theatre has a stage 50 feet by 35 feet, an auditorium with accommodation for 548 persons, refreshment-rooms, crush-rooms and dressing-rooms. All round the building on each floor are ample verandahs, the columns supporting which give the building a handsome appearance. The materials intended to be used are red brick and grey granite, terra-cotta, Indian patent stone, marble, mosaic and tiles. The interior columns, also girders, joists and roof-frames will be of steel, and the domes will be covered with copper. Woodwork has been avoided wherever possible owing to the prevalence of white ants.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

(*Continued from page 323.*)

XX.

Souvigny.

AUGUST 1, 1894, is a day to be marked with a white stone among the many happy ones I have spent in ecclesiology. t six o'clock, when I leant from the casement of my room at ie Hôtel du Dauphin at Moulins (an excellent, well-managed stablishment, by the way, in the modern French style) a light ist was veiling the cathedral spires, heralding a day of intense eat, so that the project I had formed of walking to Souvigny -distant about five miles—had to be abandoned. Certainly was in every way better to spoil a franc than to spoil a mper, and to arrive on the scene of enjoyment fatigued and ut of humour; so, like Mr. and Mrs. Brown in the "Pop isit," I "rid," hazarding a variety of conjectures when the ain got clear of Moulins as to the scene of Sterne's "Maria."

Abbey Church of Souvigny—View across Nave from North Aisle.

"It was heat and mid-day," with a misty sun looming from sirocco-looking dusky-blue sky, when—the train having posited me at its station after twenty minutes' ride from oulins—I sought the abbey church of quiet little Souvigny, e burial-place of the ducal house of Bourbon, as St. Denis is of the royal house.

The glimpse caught of the long-roofed structure from the ilway was a very agreeable one, so towards what appeared to a combination of attractions I rapidly made my way up the incipal street of the little town to the point where it debouches to the market square, a locality presenting few beauties of ature, but one in which the French churches—cathedral, onastic and parochial—are almost invariably to be looked for.

Shorn of its endowments, serving as the parish church of a wn known now to few save the ecclesiologist and historian, and ing as it does off the beaten track, it may truly be said of this ice-powerful Cluniac establishment—Ichabod. Yet to a con-mplative mind the solitude of the place possesses a certain charm which trainloads of English and American curiosity-seekers would instantly dispel. For several hours I wandered about its once busy courts, my own footfall and the tolling of the twelve o'clock Angelus alone breaking the awful stillness that brooded over the pile on this hot August day.

Of the extensive buildings which formed this fine Benedictine abbey but few traces remain, and these have been secularised almost beyond recognition. The church, stripped of its Mediæval instrumenta, has however come down to us—thanks in some measure to its having been labelled as an historic monument—in a very good state of preservation. It is, moreover, of very great value to the architectural student, presenting as it does a mingling of the Burgundian, the Frankish and the Southern styles.

Upon the original Romanesque work, which, like all that met with in Central and Southern France, has a very Byzantine tendency, much of a late period has been engrafted and superimposed. These extensive alterations appear to have been effected towards the middle of the fifteenth century, curiously enough not in Flamboyant, the then reigning style, but in Middle Pointed of a more Geometrical character. This, as might be expected from its date, is in some details poorly worked, but it possesses a great, I may say unique, interest.

Viewed from the railway the long unbroken line of roof gives the church of Souvigny an air of almost barn-like simplicity; but this idea is dispelled on placing yourself at the north-west corner of the market-place, whence the eye ranges from the plain, low Romanesque towers along the six-bayed nave with its low Decorated clerestory, past the transepts, to the choir flanked by the ducal chapels and terminating in a buttressed chevet of impressive but not exaggerated dimensions. Calm repose—resulting from its length, the low stature of its western towers, and the manner in which the roof is carried on without any break at the crux, the transepts being roofed at a somewhat lower level—is, then, the characteristic feature of the abbey at Souvigny.

Before the Middle Pointed alterations and additions the western towers must have assumed an air of much greater dignity and importance than they do now. Built of brownish

stone, and capped with low pyramidal roofs of tiles, they presented, with a background of deep blue sky, quite an Italian appearance, particularly when viewed from a slight eminence to the north of the town.

The Romanesque nave, with its double aisles, was a truly welcome refuge from the mid-day glare and heat. Entering from the large square on the north by a door at its eastern extremity I found myself in the outer north aisle of the nave, long, regular, and resembling in its superb vaulting, and in the sumptuous sculpture of its elongated pier capitals—veritable types of Burgundian richness—another great Cluniac church whose acquaintance I was to make two days later—Vézelay.

Let us take our stand at this door for a few moments immediately upon entering. We have on our right the long, speluncar northern aisle, terminating westward in the reredos-like shrine of St. Menoux. In front of us, with the intervention of another very narrow Romanesque aisle, our eyes are drawn upward to the exhilarating light of the Middle Pointed clerestory and vault of the nave, while to our immediate left, as if with the set purpose of striking an architectural contrast to the semi-barbaric decoration of the nave and its aisles, we see across the transept the graceful soaring choir, where the slender pillars, clustering like stems in corn-sheaves, present in the delicate wreathings of their capitals an assemblage of foliaged ornament of the most delicate character, all the more remarkable when we remember the late period of its execution.

And now, having taken the church in at a coup d'œil, let us proceed down the north aisle and place ourselves at the extreme west end of the nave, under the tall, good-looking organ, which, with its trumpet-blowing cherubim and seraphim surmounting the triple towers to "Great" and "Choir," is no doubt capable of making a deal of noise upon occasions.

The absence of Mediæval instrumenta, especially of the rood,* precludes the interior of Souvigny Abbey, like too many French churches, from being truly pictorial. Although it is one of the largest ecclesiastical buildings in the province of Sens, covering as it does a considerable expanse of ground, it is by no means colossal. Indeed, I was somewhat disappointed with the chevet, having formed a somewhat extravagant notion of it from a not very faithful drawing in "L'Ancien Bourbonnais." Yet the architect of the Middle Pointed additions and alterations has managed by various expedients—such as the omission of the triforium, the stilting of the vaulting arches and the employment of the continuous ridge-rib—to invest his interior with an air of great size and elegance.

Throughout the church the carved ornament is distinctly Burgundian, but that delicate guipre band which gives such a character to the wall-space round the pier-arches at Autun, Langres and Vézelay is lacking at Souvigny, where the spandrels of the nave arcade present a somewhat bald and impoverished appearance. The columns supporting the arches are slender attached ones, like those we see in the two great abbeys at Caen; but their capitals retain much more of the Byzantine spirit, their elongated forms giving ample scope for the varied subjects carved upon them. Of these capitals the richest are to be found in each of the outer aisles. As far as the string-course which runs within a few inches of the top of the nave arcades, the original Romanesque vaulting shafts remain. At that point foliaged capitals have been engrafted upon them, and down to them the transverse ribs of the nave vault have been brought without any break in the shape of capital. By this means an exceedingly élancé air is imparted to the church. The clerestory windows, forming in their lower unglazed portion a species of triforium, unrelieved, however, by an arcading, are of two trefoil-headed lights, each with a quatrefoil in the head—tracery of a Geometrical character, very remarkable when we remember that its execution dates from the middle of the fifteenth century—a period which in many parts of France saw the earliest declension to the Renaissance.

As the transverse vaulting ribs give lightness and height to the interior of Souvigny, so the longitudinal ridge rib, carrie throughout nave, transeptal crossing and choir without breal imparts an idea of great length. This ridge rib, which a Souvigny is crocketed on both sides, presenting thereby a ver pretty feathered appearance, is a feature rarely used by th French architects in their thirteenth and fourteenth-centur buildings.* Its introduction, however, at a late epoch wa certainly an improvement, as marking the point of the vaul It could not, of course, be used with circular arches whe there was no central line for it to mark, and it probably wa from this cause that the French seldom adopted it, having bee accustomed to vaults not requiring the ridge rib, a featu which in the great English contemporary works is neve absent.

Having briefly noticed the main features of interest in th nave of Souvigny Abbey, I will now conduct my readers int the aisles, noticing *en passant* that the floor, composed of tile in large squares, is, as are the bases of several pillars, gree with the saturation of ground-damp. The aisle flanking th nave on either side is very narrow and much loftier than th outer one. Spanned at the interval of each bay by an arc springing on either hand from a tall Romanesque shaft, i simple domical, or, to speak more strictly, barrel-shaped vau has in many places a very rough appearance. Lower, b more than twice as broad, is each outer aisle. That on th north retains its Romanesque features unaltered, *i.e.* the simp quadripartite ribless vault, spanned at the interval of each ba by arches whose bright, metallic-coloured stones impart grateful sense of natural polychromy, the long line of wall wit its series of arcades on slender pillars, fascinatingly carved a to their capitals, and the simple round-headed window lightin every bay over them. Its neighbour on the extreme south ha however, undergone a complete metamorphosis from the han of the fifteenth-century architect, vaulting and fenestratic being alike Late Gothic. With this we do not feel inclined quarrel, since it presents a variety in the perspective view which force themselves upon the attention from every point i this delightful church. The shrine of St. Menoux—once a object of local veneration, shockingly mutilated—forms a ver imposing termination to the north aisle looking westward. consists of two tiers of Byzantine-Romanesque arcades of ver rich workmanship, surmounted by three figures. The cent one, that of Our Lord, has lost the head, but the crucifor nimbus remains; the standing figure on either side is likewis headless, and so is the seated one, vested in a chasuble whi surmounts another tier of arcades just to the left. Simil fragments exist to the right of the central group.

Occupying a like position at the west end of the out south aisle is a trefoiled arch, within which is seated anoth headless figure, chasubled. The folds of the vestments a marvellously natural, while the patterns on the orphreys a reproduced with a delicacy and fidelity that I have rarely se equalled. Below the figures is a row of six cusped arcades a a very mutilated recumbent effigy. This end of the south ais forms the baptistery; here in juxtaposition to a bulging oc gonal font standing upon the ground, without a pedestal a bearing the date 1626, is the elongated bowl of the Mediæv one.

The choir of the abbey church at Souvigny has, like t nave, five aisles. The choir itself, including the chevet, Middle Pointed of about 1440-46, but the side aisles from whi the ducal chapels open, while in the main of the same da still retain a good deal of their original Romanesque charact Each of the narrow inner aisles of the choir communica with the procession path or pourtour, where the Romanesq work of the radiating chapels is undoubtedly a jejune "resto tion." The other aisles, much disturbed by the engraftment the sepulchral chapels of the Bourbon dukes, are approach from the transepts by pointed arches on very richly sculptur responds. A genuine bit of Burgundian Romanesque wo exists in the respond of the arch opening from the no transept, where the fluted pilaster crowned with a Corinth capital occurs. Through this arch a delightful peep of e Chapelle Neuve is to be obtained from the western end of e north nave aisle; but, owing to a screen which fills up the a

* I may here remind my readers that the destruction of this beautiful—nay, indispensable—feature in a Gothic church took place almost entirely throughout France during the middle of the eighteenth century. It was due, not to Huguenot or Revolutionary fury, but to the bad taste of the clergy themselves. The high close screens that now remain in France may be counted on the fingers.

* It occurs in the cathedral of Bayonne.

ening into it from the south transept, a view of the Chapelle ielle is not obtainable from a similar point of the opposite sle. The said screen resembles in some of its details the lebrated one of Prior d'Estria in the choir of Canterbury athedral. Two wooden doors in it admit to the Chapelle ielle from the south transept. The original Romanesque wall tained in the south side of the chapel is relieved by blind cades—three of them are those peculiar triangular ones often et with in the neighbouring province of Auvergne, and three e of the customary round-headed form. Through the central ie of these latter, and forming part of another exquisite iddle Pointed screen, a doorway is cut, giving access to a naller chapel or chantry, which at the time of my visit ppeared to form a receptacle for sundry pots of "Marguerites" various stages of decomposition. In the centre of the apel—scratched and scribbled all over with names and dates ot a few belonging to the seventeenth century), thus proving at the detestable mania evinced by Tom, Dick and Harry r leaving their illustrious names on every object with- reach is not confined to our own day—are the o contiguous altar-tombs, with recumbent effigies in arble, of Louis II., Duc de Bourbon, and Anne of uvergne, his wife. A Flamboyantly-traceried window in this apel has some worthless modern stained-glass in the pretty picture" style. It was quite a relief to turn from this ckly specimen to the noble, but, alas! sadly fragmentary mains of fifteenth-century glass in the clerestory of the great evet, whose series of five arches on cylindrical piers are very utely pointed and rather triangular in their aspect. To the st and west sides of the pillars a slender shaft is attached, rving for the main ribs of the apse groin and those of the cumambient aisles respectively. Their caps are foliaged, ough not by any means so delicately as are those of the cades on either side the choir proper, where the reproduction the natural flora is marvellous when the late period of its ecution is taken into consideration. But to return to the se. There is no triforium—a feature conspicuous by its sence throughout the building—the tall, two-light windows the clerestory rising, with the intervention of a deep sill only, mediately above the string-course surmounting the pier ches.

In his excessive idea to do away with all solid wall, and to t the greatest possible surface for painted glass, the architect the chevet at Souvigny has made the two trefoiled lights of s windows as tall as possible, and has placed the smallest of atrefoiled circles in the head of their arches, besides piercing e spandrels of the vault with tracery, which, at a little distance, ing to the low point at which the main ribs begin to spring, ve quite the air of those flying buttresses on the exterior of enry VII.'s Chapel at Westminster.

That the apse vault at Souvigny is distorted in order to oduce this air of légèreté is a fact no one who has the greater riety of the early French vaulted apses in his mind will empt to controvert; yet it is impossible to deny the elegance this invention, which has, I believe, found few admirers, or least no imitators. Doubless, while the painted glass which ce filled these windows, and of which scanty but beautiful gments still remain to attest its former grandeur, remained act, the ideas of its architect were seen to far greater adntage than at present in this apse at Souvigny.

There is, however, enough glass left in these windows for us judge of the magnificent spectacle the eastern part of the urch must have presented before the destruction of its reous decoration; for the rich rubies and blues in the vestnts of the Apostles, which fill the two northern windows of five-sided chevet, still retain their jewel-like brilliancy of louring, contrasting vividly with the grisaille of the backounds and canopies. Except of a very small piece here and ere, the southern windows are entirely denuded of their ecious adornment, but this loss is, on a fine day, somewhat mpensated for by the very pretty picture presented by a sunded pinnacle and flying buttress which, with a background blue sky, peer through the unstained southern windows of e apse in the most enchanting manner.

The three bays on the south side of the choir are all of the me height, but above the central one the clerestory is itted. This feature is likewise wanting above the corresponding arch on the north side, which is thrown up far above the one on either side of it, in order to bring it to the same level as the arch opening from the first narrow north aisle of the choir into the elegant Gothic Chapelle Neuve, with its recumbent effigies of Duc Charles and his wife Agnes de Bourgogne. The style of this chapel, which is much loftier than the Chapelle Vielle, and terminates in a three-sided apse, is very good Flamboyant.* The windows occur only in the central compartment of the apse, and are tall ones of two trefoiled lights. Over them are hung blinds, in many places going to rags, and having upon them frightful "Gothic" patterns such as one sees on wall-papers in seaside lodging-houses. As this part of the abbey now forms the lady-chapel, it is furnished with an altar, and the hideousness of these blinds is in some measure mitigated by bannerets, each with a figure of the Blessed Virgin, bearing such inscriptions as "Mère du Créateur, priez pour nous," "Mère du Sauveur, priez pour nous." The ribs of the apse groin start from rich spiral canopies surmounting small figures in niches between the windows. Some tall net-like screens separate the chapel from the north choir aisle: a large Flamboyantly traceried window, which would look well if filled with stained-glass, lights the chapel on the north, and a finely-moulded door leads on the left to a chantry, which, like its neighbour on the south side of the Chapelle Vielle, forms apparently a receptacle for rubbish.

An extremely devotional adjunct to this chapel is a copy of that celebrated *Immaculate Conception* painted by Murillo for the Church of the Venerables at Seville, now in the Louvre, and for which the French Government in 1852 gave 24,612*l*. In a plain gold frame, and bearing the inscription, "Donné par le Roi en 1842," it is suspended on the unfenestrated portion of the apse wall just to the right of the lady-altar.

There are several other little details in the transepts and nave at Souvigny to which I should like to draw my readers' attention, but as I fear I have already trenched too long upon it I will just place them with me beneath the western organ gallery, gather once more the long perspective of this interesting abbey church into one view, and then pass from its damp, sombre, Romanesque aisles to the warmth and light of the adjacent market square. Here, in front of the west end, helping to compose a picture which Prout would have delighted in, are the many-hued umbrellas of the cheats and bargainers who every now and then, leaving their business to come into the sacred building and pray, admit for a moment a shrill babel of voices, and go out again into the brilliant sunshine to commence cheating and bargaining as before.

(To be continued.)

THE LAMP OF LOTHIAN.

"WHAT cathedral is this?" asked a sailor as he passed the gate of Haddington cemetery to pay the last offices of affection to a deceased parent. "Not a cathedral, but the parish church," was the answer quietly given. The seafaring man looked perplexed. "She's sair broken doon; she's been through storm; she's mair like a cathedral than a pairish kirk." It was not difficult to apprehend the seafaring man's point of view. In his limited experience, says the *Scotsman*—for he was only skipper of a trawler, and had enjoyed but an occasional glimpse of the grey towers of St. Andrews and Kirkwall—he took it for granted that an imposing ecclesiastical ruin must of necessity be a cathedral. The hoary aspect of a glory not yet vanished settled the name for him; and the aspect of Haddington parish church is so commanding, so replete with the feeling of ancient stateliness as compared with the pretty little Gothic imitations which serve as places of worship amid suburban villas, that the people with one consent call it the abbey, or rather the "aibbey," to be phonetically correct. To the local antiquarian this name "aibbey" is a perennial grievance. Thousands of times he has endeavoured by rebukes and pleadings and contemptuous smiles to stamp out the pestilent error. By speech and pen he appeals to the testimony of ancient parchments, proving that the "Church of St. Mary of Haidinton," or "Paroche kirk," or "Hie kirk," or "College kirk" is the true designation, but he might as well rail at the inflowing tide. "Aibbey" they love, and "aibbey" they will keep, although it should pain local antiquarians to the end of time.

* The accompanying illustration shows this Chapelle Vielle in the distance.

As to the term "Lamp of Lothian"—"Lucerna Laudoniae"—which heads this article, there has been considerable divergence of opinion. Some, who can hardly be called authorities, while they are quite willing to drop the designation "Abbey," are reluctant to part with the unique and euphonious distinction "Lamp of Lothian." And yet, unhappily, the little available evidence there is does not favour the assumption, but simply shatters it—if John of Fordun be correct. This fourteenth-century chronicler tells us that Edward III., to avenge a raid by the Scots in his territory, crossed the Tweed in 1355 at the head of an army, laying waste the land as far as Edinburgh, and burning "the town, the monastery and the sacred church of the Fratres Minores (Franciscans) of Haddington, a costly and splendid building of wonderful beauty, whose choir, from its elegance and clearness of light, was commonly called 'The Lamp of Lothian,' or 'Friars' Kirk.'" It may be said in passing that the Episcopal Church of Haddington stands on the old site. If the Friars' kirk had been the Paroche kirk there would have been no difficulty as to the application of the lustrous epithet which every loyal Haddingtonian loves. But they were entirely different buildings, as the following extract from the Town Council records showeth:—"November 7, 1572.—The Counsall ordains all the pavement of the Frier Kirk to be transported to ye Hie Kirk and laid thair." The process of transportation must in course of time have been carried to the point of obliteration, for not a rack is left to recall the once famous shrine of the disciples of Francis of Assisi. Nor were the civic fathers simply content to remove the "Friers" pavement to the parish church, but they, or some person more distinguished for astuteness than for what Carlyle calls "conscientious scrupulosity," likewise deemed it proper to transfer the glowing name to the only building remaining that seemed worthy of it, and which alone has in large measure withstood the ravages of the wild years. The old pavement has disappeared, no man knows whither; but the "Lamp of Lothian" still abides and bids fair to stay. It is just one of those felicitous names that the world will not willingly let die; and if it befits the place of its adoption as it does so well, why cavil? "On these terms you may have it," says the local antiquarian, and thus the "casus belli" is amicably withdrawn.

Beautiful for situation is this ancient church. Around the venerable walls we look upon the hallowed resting-place of many generations, its margin not lacking in the soothing grace of plane-tree and willow, every spot carefully tended, and only a few yards from the eastern window the waters of Tyne, their onward flow here subdued, as if in unison with each whispering memory and sacred association.

> Beautiful in their sorrowing sympathy
> As if they, with a weeping sister, wept.

As to the history of the church, we learn that Haddington, like several other Scottish towns, owed its early ecclesiastical distinction to the zeal of David I., third son of St. Margaret, Malcolm Canmore's gentle queen. He inherited his mother's love of Holy Church, a love blind to the burdens of a poor and heavily-taxed people, and deaf to their complainings, a love which depleted the treasury while it endowed the clergy, and adorned many an ancient burgh with a marvel of architectural beauty. In the words of Andrew Wyntoun (1420)—

> He illumynyd in his dayis
> His lands wyth kyrkys and wyth abbayis.

But while frankly admitting the glory, we feel there was also distressful truth for an impoverished country in the witty remark of James I. of Scotland as he stood by David's tomb in Dunfermline—

> He was ane sair sanct for the croon.

In a royal charter dated 1134 we learn that David granted to the Priory of St. Andrews in perpetual alms "The Church of St. Mary of Hadintune," endowing it, as was his wont, with ample lands. For almost the next three centuries the history of St. Mary's is a blank. In 1426 it is mentioned in the "Buke of Auld Register" as receiving manifold gifts for its fifteen altars. For the following and other illustrative excerpts from old documents I am indebted to Mr. James Robb, the venerable author of a history of the Royal Burgh of Haddington, whose careful researches in all matters pertaining to the "Paroche kirk" have been a labour of love. "28th May 1426.—John of Furde gave a silver chalice weighing 12 ozs. 5 dwts. to Saint Peter's altar. Jonetta Menis gave one mirk of annual to the altar of St. Mychael in the Paroche kirk of Haidinton, for dirge and placebo, to be said on the death of her father and mother." If each of the fifteen altars required a ministering priest, we can easily understand the appropriateness of that other appellation, "The College Kirk."

Whether the building, as we see it now, is partly David's, or quite another erected on the same ground, has been a matter of controversy. Frequently did the old town experience fire and sword and desolation. The probability is, therefore, tha David's church suffered grievously in the conflagration that wa part of Edward's revenge aforementioned; and when quiete times ensued the work of restoration on a grander scale woul be begun, and in all likelihood ended in the early part of th following century, when we read of the church, as we have seen, receiving the gifts of the faithful. Fourteenth-centur Gothic is the usual verdict of experts as they mark the archi tectural features of the building. Previous to the Reformatio its up-keep seems to have been largely in the hands of th burgh. In the Town Council records there are frequent refer ences to repairs being ordered by the municipal authorities an paid for by the town's treasurer. The old sailor's remark "She's come through storm," is confirmed not only by roofles choir and transept, but also by the appearance of the soutl wall, which, judging by the numerous shot-marks in evidence must have experienced storm of battle. In 1548 during th minority of the unfortunate Mary, an English force held th town, the object being to prevent a proposed union of th French and Scottish crowns, and in the conflict which ensue the old church, whose strong walls sheltered part of the Englis garrison, had to bear the brunt of the French artillery, whic partly may account for the ruined condition of transept an choir. "In the churchyard," says Mr. Robb, "numerou cannon balls, small as well as large, even up to 40-pounder have been turned up."

Just two years before this siege of Haddington the Paroch kirk one afternoon in 1546 witnessed a very different scene— not the fierce commotion of battle, but the fervid presentatio of the reformed doctrine by George Wishart, who was arreste on the following night at Ormiston and shortly after suffere martyrdom at St. Andrews. John Knox was present, and h tells us the "auditure" was small—not a "hundreth personis —and that the soul of the preacher was much vexed thereby It is sometimes alleged that East Lothian folks are "cauld an dour," and very different from the warm, responsive people o the West Country. Whatever truth there may be in th allegation, it is certainly an incontrovertible fact that th Haddingtonians did not manifest any very pronounce emotionalism on either side of the religious conflict. O course, there would be the few exceptions that proved the rule isolated cases of fierce partisanship, similar to that of Hepbur of Morham and Birnie of Edinburgh, who resolved to settle th number of sacraments by single combat, and only succeeded i slaying or settling themselves. Presbyterian Protestantism quietly but firmly took possession. The people acquiesced The fifteen altars in the parish kirk disappeared, bu there was no violent demolition of the sacred build ing, and in course of time, under the reformed régime ugliness and dirt became fairly well established. As bearin out this policy of peaceable acquiescence we may note th pathetic petition of one Sir William Wilson. The title "Sir need not mislead. It was given in those days to very humbl ecclesiastical functionaries, such as the vender, exhorter an doorkeeper of the church. Sir William petitioned the Tow Council (March 26, 1567), and assured them that although th change was only "an imitation of religion," he was willing an eager still to serve "in yis Perroch Kirk" subject to the ne regulations, "sen I had the said office of your progenitours and of sum of yoursels now present, and am ane born bairn o yis burgh, to quhom nature suld incline you, to my support an rationable petition, sen ye know my need at yis present, an your wisdomes answer heiron Humbly I beseik." Th "bawbees" appear to have settled the religious leanings of Si William; and "The Provost, Baillies and Counsall consent to ye petition forsaid."

One or two details as to structure may now be give Built in the usual form of a cross, it equals St Giles, Edir burgh, in length, measuring from the east window of the cho to the west door of the nave about 200 feet. From the centr of the transept a massive tower rises to a height of 90 feet- "one of the most graceful lanterns to be seen in stone"—b that it had, as some think, a corona similar to St. Giles unsupported by any available evidence. The western doorwa arrests attention as a work of striking merit. It is divided int two entrances by a moulded shaft, and has an enclosing arc of much elegance above. At the top of the central colum we have the symbol of the Passion, consisting of a crown thorns, with hands, feet, heart, and nails inwrought in the ol red sandstone, and still marvellously distinct notwithstandin an exposure to the elements of at least four centuries. Th window in the south arm of the transept has been rebuilt b Lord Wemyss; and in 1875 the large eastern window of th choir was similarly restored as a memorial of Dr. Cook, former minister of the parish, who still lives in the affections the people, and who was known throughout the Church as th distinguished Clerk of the General Assembly.

But the greatest transformation has taken place in th interior of the nave. The present writer never saw what th part of the building was like about nine years ago, except photograph. The picture could hardly be called prepossessir

h its "lafts" clinging to whitewashed pillars, where "lafts" d whitewash were never meant to be. And yet it was very ar to some because of the tender memories of a lifetime. ie sensible-looking person, with perhaps an excess of idour, said it was a dungeon of unpleasant smell. It is now oroduct of the Renaissance of ecclesiastical taste all over the id. Thanks to the collegiate ministers of Haddington at the ie, the Rev. D. R. Nimmo Smith and the Rev. J. F. W. ant, now of St. Stephen's, Edinburgh, also to liberal heritors d generous friends far and near, of whom one may specially ention the late Miss Aitchison, of Alderston, and her sister, dy Denman, we now have the plain unplastered walls owing the grand masonry of long ago, elegant pillar and aceful arch relieved of their superfluous coats of whiteing, mfortable oaken pews instead of straight-backed boxes, all ich need not hinder, so far as fallible mortal is able to judge, worship of any devout soul. Of course, tastes differ; it was a respected old lady who exclaimed, "Eh! s wad be a braw kirk if it was a' papered and nted." And then there is the much misunderstood d, therefore, much maligned lectern. The baptismal it is allowed to pass, but the lectern, the brass eagle whereon its the Book, is to some as iniquitous as Aaron's golden lf. A good man told me the eagle was the symbol of Satan, he had found it so described in his dictionary of the Bible. vain you tell him that your dictionary says the eagle is the tural enemy of the serpent, and also the emblem of St. John, io, like the eagle, looked on "the sun of glory." He knows tter. It is the thin end of the wedge that will by-and-by lit the Kirk, and admit the flood of Romanism. A point of w, no doubt, and yet fatuous to a degree.

And what of the organ, "that hallowed source of glorious und?" To some it is a trial, a sort of diabolic discord in t to those who have a lingering affection for the few familiar nes of the old precentor. One may sympathise with the ling, but too many untuneful reminiscences gather to permit e to think that the former days were better than these, and is certain that the surest way of alienating the young and iptying a town kirk, whatever may be said of the country, uld be to restore the old baldness of worship.

We are sometimes told that human nature is complex. iis commonplace truth was on one occasion somewhat unpectedly accentuated. "I can staund yer harmonium, but r organ is simply insufferable, and I want my lines." To all ch complexities of the genus Presbyterian, "lines," no doubt, ll be readily granted. Pity that plausible pretext should thus given to the satirist who said:—

A sect whose chief devotion lies
In odd perverse antipathies.

ommend us rather to the broad-minded old beadle who said the church that now bears the title of Lamp of Lothian:— There's naebody that can be disappintit here, sir. For if the mon's no up to the mark, there is aye the organ; and if the gan's oot o' tune, there's aye the choir; and if the choir's no pfeecient, there's aye the scenery"—part of the "scenery" ing six fine memorial windows, one of them executed by Mr. illiam Morris to a design by Sir Edward Burne-Jones.

PICTURE FRAMES.*

WE cannot to-night occupy much time in considering the origin or antiquity of picture frames, but may refer to me of the oldest known to us. The frescoes of Pompeii, still parts perfect and beautiful, offer numerous examples of ming designed by the artists for the isolation of their subcts and the enhancement of their effect, these being the mary objects of all such framings.

At the British Museum Dr. Murray kindly pointed out eir oldest frame, of about the second or third century of our . It is of a hard wood like beech, of what we know as the Oxford" pattern, with a marginal 1-inch flat; a groove to ceive glass and cord to suspend it by the corners; the panel d a portrait of encaustic, now nearly obliterated. We also w an engraving of a Pompeian studio, in which a lady artist sitting, with a similar frame and portrait in it near her. We en went to the finely-preserved mummy from Hamara in the ayoum of a young woman once of much beauty, whose portrait a 12 by 9 panel is at the head, with a framing of many folds the cerecloth, which is ingeniously swathed so as to form a ometrical pattern all over the body. I am told that poor gyptians who could not afford to have such portraits painted pressly for their lost ones used to buy from stocks of readyade portraits such as most nearly resembled the deceased, d when the swathing cloth decayed such portraits were hung as pictures. It was a custom of the Romans to have upon round or shield-shaped wood, portraits called "imagines" of their celebrated dead, modelled in coloured wax, to carry these in the funeral processions, and afterwards suspend them in the houses.

We know that the ancients painted in every style of art, excelling in all, and though Pliny says that "the greatest glory was obtained by easel pictures," he gives, as another reason for preferring them, the one that paintings upon the actual walls cannot be saved in case of fire. We read that Cicero sent large sums of money to his friend Atticus, to buy pictures in Greece, for decorating his villa at Tusculum, and the artists of distinction, like Polygnotus, must have been well aware of the importance and effect of suitable frames for their masterly works.

That no examples of beautiful ancient frames can now be found is not surprising, for we are told that the anti-pagan zeal of the early Christians led them to destroy everything they could which was pagan, however artistic; they used to put ropes round the marble necks of the almost divinely-beautiful Apollos and Venuses, drag them into the open, try them in public like criminals, find them (of course) guilty, and then pound to dust statues by men whose very names we reverence to-day. Thirteen hundred years later a religious zeal, not according to knowledge, led Cromwell's troopers to stable horses in Worcester Cathedral, whilst moneys were actually paid for the destruction of stained-glass which we should now consider priceless. We do, however, owe to the "Protector" the purchase of Raphael's cartoons for the nation.

There is not time to include in this paper frames made for predellas or altar pictures, those for the exquisite Venetian and other mirrors, or those designed for the sculptural works of such artists as Della Robbia, Donatello and Sansovino, numerous and beautiful as they are; of these fine examples exist at South Kensington and in private collections such as the Wallace one. Of the vast number of designs made to surround portraits engraved in the sixteenth, seventeenth and eighteenth centuries, some prints, kindly lent by Mr. George Clulow, are hung here. And we are indebted to Mr. Hugh Stannus, always active in the interests of art, for the photographs which show framings in panels, walls and ceilings of the most celebrated Italian buildings.

Persons who will take the trouble to examine the frames used by the older English masters in oil and water-colours will notice the poverty of design and the want of taste of most of them. This was felt so much by the leading artists in the sixties that they were led to make great improvements, and apropos of the commonplace expression, "What a beautiful frame," uttered sometimes by those incapable of judging the merits of a picture, two articles appeared with illustrations in *The Architect* exactly thirty years ago. These were written by Mr. Phené Spiers, master of the architectural schools of the Royal Academy, himself an accomplished artist. He said:— "In a frame lies a not inconsiderable portion of the completeness of a picture, and there are fortunately a few painters, Mr. Leighton notably among them, who have long recognised the fact that their powers of imagination and composition ought not to terminate with their canvas." Mr. Spiers ably criticises the frames in the exhibition of the Academy in 1869, and we shall have details of those frames on our screen, with his remarks for our information.

110. Mr. Poynter. — The close juxtaposition of the pateræ suggests a running border; they should not have been emphasised at the corners.

117. French.—None in the exhibition giving more effect to the picture.

154. Mr. Alma-Tadema.—A Belgian frame, somewhat similar, with burnish brought into the ornament, and not, as in the English, confined to the lines.

421. Mr. Alma-Tadema.—Shows careful attention to style, the large cavetto member making it rather less happy than 154.

81. Mr. Richmond.—Good, but not his design, too free use of the figures of devils, omitted on screen as ladies are present.

174. Mr. Portal.—French, showing influence of Greek art more than any other frames, except those of Mr. Leighton.

452. Mr. Yeames.—Vigorous and bold, appropriate to the period of picture; improved by a deeper set-back and broader margin of plain.

99. Mr. Sandys.—One of the most original; the simple Gothic moulding and contour accord with style of picture, splayed surface at bottom giving solemnity to the subject.

272. Mr. Armitage. — Egyptian ornament, contour very good, accessories in keeping with subject.

705. Mr. Leighton.—Refined, showing knowledge of the best and most subtle forms of Greek art, the effect of painted ornament on the gilded surface of the frame very good, and might with advantage be more extensively employed.

864. Mr. Leighton.—Well-studied, but less good, rather heavy and tending to convexity in contour of moulding.

483. Albert Moore.—Simple and effective.

699. Albert Moore.—Sparkling and delightful.

485. Frank Walker.—Original, but section too straight.

730. Mr. Prinsep.—Based on Leighton's, but not Greek.

736. Mr. Graves.—Very good in design, and well modelled.

* A paper read before the Applied Art Section of the Society of ts by Mr. I. Hunter Donaldson, on Tuesday, May 16.

Fourteen years ago, Mr. W. R. Lethaby, in an able paper, drew attention to the poverty of design in frames then exhibited, with some remarks to which I shall refer later. Before this time much attention had been given by foreign artists to their frames, which were not unfrequently designed under the influence of the best Italian period, some examples of which will be shown. We are justified in expecting that since the year 1869 an advance should be seen in the designs of frames, especially by our principal artists, and some of the more recent ones will be displayed. We may soon hope that when the expression, "What a beautiful frame," is heard, it may be found to proceed from a person whose cultivated taste and sense of beauty apply equally to the work of a true artist in his picture and in the frame he has designed for it.

I do not think it can be claimed for the frames in this year's Academy that they show any advance in design upon those of thirty years ago; some of the largest are defective in architectural detail, and some have large, busy, obtrusive mouldings close to the pictures; there is a noticeable display of old frames, for which there is now great demand, and for the first time we see a number of gilt frames toned almost to the colour of wood; some of the most grandiose lack the refinement of those of 1869, and although there is undoubtedly more variety than formerly, there appears to be less purity of taste. The true relation of a frame to a picture has probably never yet been the subject of one lecture to students, and the very alphabet of this phase of art is unknown to thousands of them.

Not a little of the effect of picture frames depends on their being hung in a suitable light; a side light in a too projecting frame may cast an injurious shadow. Not long ago I saw an exquisitely carved frame and an equally beautiful panel in low relief, placed between the two windows of a room; the work cost 1,200*l.*, and was practically lost for want of the side light which all such works should have. Apropos of this, we may recall the story of Douglas Jerrold and Albert Smith going to a picture gallery. On the stairs was a mirror, standing before which Albert Smith said, as he looked into the glass, "Ah, my boy, there's a picture!" "Yes," said Jerrold, "it wants hanging." So when we have a good picture in its proper frame we must not forget that, as Jerrold said, it 'wants hanging," and that carefully, in justice to the artist.

We must all have observed the great value of black in frames, especially in works of the Dutch and Spanish masters, sometimes with bands of tortoise-shell or fine lines of gold, with the varied and very characteristic hand mouldings which had their origin in Spain and were adopted in Italy and Holland, the Dutch artists especially recognising the suitability of such framings for their paintings. Mr. Watts was among the first to observe this, but, curiously enough, the least happy use of black is perhaps in the large works of Mr. Watts at the Tate Gallery, where, at a little distance from them, broad bands of gold separate, instead of combining, the frames and pictures. This rarely occurs in the foreign examples. There are some good black and gold frames in our national galleries, and, as we know, in the mezzotints of Bartolozzi, Ward and others, black behind the glass, with gold lines and delicately-moulded gilt frames, gives great charm to the works of their time. The neglect of proper framing by early and very able masters in water-colour is surprising in view of the seventeenth and eighteenth-century framing known by them, some of their finest works being injured by mean and meaningless surroundings. Men of acknowledged eminence, even in our own day, have not troubled themselves to consider the art of framing. It will, I think, be a matter of surprise that our noblest writer and critic, Mr. Ruskin, has not yet treated this subject in any of his beautiful works, and in many of those of authority upon painting which I have consulted, no reference to frames is made. The most noticeable of English designers of them is Grinling Gibbons, born in London in the latter half of the seventeenth century. He was recommended by Evelyn to Charles II., who commissioned him to execute the ornamental carving for the chapel at Windsor; he also did the foliage and festoons of the choir of St. Paul's, the baptismal font in St. James's, Piccadilly, and works at Petworth, Burleigh and Chatsworth, and Hampton Court, &c. His talent was wasted in carving pens and feathers that were mistaken for real ones, flowers which used to move on their stems by the air, &c. We shall all agree, probably, in thinking such work, however full of loving labour, unsuitable for picture frames, to which it has been applied. The modern English housemaid would soon reduce much of it to matches; but on my last visit o Florence I found a fine example of Gibbons's carving in a pub ic museum, and a very ambitious work in South Kensington Museum is his "Stoning of St. Stephen," probably copied from a painting. With some defects of perspective, it is not "the highest form of decorative design," in which Mr. Ruskin said, twenty years ago, "the English will never excel," but the rare sense of beauty in natural objects, manipulative skill and tireless industry of Grinling Gibbons will always secure a place for him in the annals of art as our most original frame maker.

As miniatures have always to be examined near to the e the effect of any mode of framing has not seriously to considered; the oval form is obviously the best and mo generally used, but the marked advance of this form of art h led to the adoption of square or oblong frames, generally ormolu; these are not, however, quite within the scope of o paper. Now, whatever our objection may be on patrio grounds to things "Made in Germany," it is only just to adn that we owe to that country the introduction of highly-finish frame mouldings in colour and gold, well suited for drawing engravings and the many and beautiful developments photography; we have "bettered their instruction" with o framings in light and dark oak, walnut and the shades stained-green ash and oak which, with delicate gold lines, gi such charm to these latter day works.

The Americans, too, have entered this field, and now Mess Graves & Co., of Pall Mall, have frames of their make dec rated in the "Adam" and "Empire" and other styles, wi ornaments laid in gesso on stained walnut, oak, in tinted ivo on neutral green, in bronze, on black, &c., of great variety, a with harmonious effect. The style employed has perfe examples all around us, well-known to art lovers, but it h remained for our cousins to glean the field which was sov here and abroad a century ago, and the mezzotints, now much sought, are charming in these surroundings. T "Autotype" Company have courteously sent some specime of their less elaborate but highly artistic frames, and I cann imagine any more suitable than these for the charming phot graphs with which they have made us so familiar. T Florentine modern frames of carved wood, as you will se have delicacy and beauty of detail; more elaborate, and nece sarily more expensive, they are of great technical merit, ar are superior to any machine-made ones. Messrs. Gou & Co., of Regent Street, have also lent gilt frames of mark character and high finish, with some others specially suitab for works in oil. Messrs. Gillow & Co., of Oxford Street, ha kindly lent a variety of interesting and artistic frames Italian and English make.

Now, a serious impediment to the art of frame making the rule of our Royal Academy not to admit any other th gilt frames. I do not know in whose prejudice or interest su a regulation originated; but I am confident of the support able artists in saying that it should be rescinded, and that doing so an impulse would be given to the production of tru artistic frames in gesso and in carved and decorated woo such as we see abroad, and enormous additional effect b secured for paintings at every yearly exhibition. I earnest hope that the enlightened President will soon distinguish h reign by effecting this much-needed reform. The beautif and allied arts of modelling in gesso, carving, inlaying, decor ing and enamelling would be stimulated, and public encourag ment be quickly given to such a progressive measure.

The material objection, I believe, is want of space, but Disraeli said, "a difficulty is a thing to be overcome," and excluding works of a secondary character the experiment mig be made of giving one room to some of the measureless varie of artistic frames other than gilt ones. I am fortified in th hope by the fact that for the first time we see in the Acaden this year some frames with the gold toned down to almost t colour of wood in pictures on the line. Oh for another Alfr Stevens who would, with proper encouragement and with h unequalled genius, have created a school of artist framers fine as any known to the world. We are, as Mr. Leth wrote in 1885, still waiting for an inspired artist worker, w must be free and with pride in what he creates; he will be, Stevens was, familiar with the glorious old Italian metho and will, I trust, be able to overcome the narrow-souled econor of even a Cabinet Minister of Public Works; then, indeed, may be possible to read of an Academy picture some su notice as this:—

"The Florentine, Simoni Ceni, wrought the carving, a Gabriello Saracini gilded it; Spinello of Arezzo did the painti in 1385."

In lending the kakemonos and frames, Mr. Phené Spi says:—

"It has struck me that a few words on the framing mounting of drawings in Japan might not be without so interest, seeing that, until within the last few years, th methods have been carried on for centuries uninfluenced by t customs or practice of other nations.

"The Japanese have two methods: the kakemono hanging picture, suspended temporarily only in the house temple, and otherwise kept rolled up and preserved in t godown—the fireproof store-room; and the framed drawi hung up in the temple or carried about in procession In the latter case the frame consists of a simple con moulding, the width of which varies from half an inch to 6 7 inches, according to the size of the picture, and this mould is painted over with body colour with natural flowers (as in c of the examples shown), or with geometrical patterns, leav the grain of the wood as a ground, or again with sprigs, leav

ıd flowers modelled in gesso (as in a recent example). Sometimes the frame is coated over with black or green lacquer, ı which geometrical patterns or sprigs of plants are cut ırough to show the white wood. The more elaborate frames re richly decorated with avanturine lacquer, with geometrical ıtterns in gold lacquer, and the angles and sometimes the ınger sides are strengthened and decorated with brass plaques ıcised with ornament. The drawing in these cases comes ose up to the frame, with a border of black or red lines to olate it from the frame.

"The kakemono, or hanging picture, is mounted and ecorated in a conventional manner, which is apparently lways rigidly adhered to, and which seems to have existed for enturies. The drawing is mounted on linen or paper, with a ıargin of from 2 to 4 inches on each side, and from 2 to 4 feet)p and bottom, the lower border being about half the depth of ıe upper border. At the top and bottom of the drawing is a arrow strip of damask, the upper twice the width of the lower; n each side of the drawing the 3-inch margin is covered with amask or silk of a different colour, the depth of the border bove (6 to 8 inches) being about twice that of the lower order. Beyond this, above and below, covering the remainder f the mount is a flowered silk or gold damask ground, ·ith again double the depth at the top. A wood roll at ıe bottom, with ivory or polished ends, serving for rolling p the drawing; at the top is a semicircular roll with ings to suspend the kakemono. From this upper roll hang wo strings or tapes of the same material and colour as that of ıe upper mount, the original object of which is not clear; robably it is a revival of a custom of tying up the kakemono, ut they are never missing. The damask or silks which form ıe borders are, as a rule, of much greater age than the drawıg, and it is probable that the professional mounter, or erhaps the owner of the drawing, supplies these materials, ·hich are the remnants of ancient dresses either belonging to ıe family or acquired from actors. The latter, as may be een from the Japanese colour prints, wear the most gorgeous resses, and when done with these would seem to be cut up nd utilised, either for the purpose above stated or as bags for recious pieces of lacquer, ancient tea-jars or masks. In the wo examples exhibited one is a Buddhist kakemono, which was robably hung in a temple; the other has mounts of blue silk nd ancient damask which are really of much greater value ıan the drawing they frame, and of great beauty of colour."

A reference must now be made to "mounts," which are so xtensively used, and of modern artists Sir Edward Burne-ones is the one who has given most attention to them. Some f his designs are marvels of elaboration, and those recently een at the Burlington Fine Arts Club were striking evidences f his fertility and refined taste. Ruskin says, "All noble rnament is the expression of man's delight in God's work," nd "genius" has been defined as "an infinite capacity for ıking trouble." These Burne-Jones undoubtedly had. A ıort list of his frames, mounts and grounds may be of use for ıture reference, and twelve examples will be given in the Journal" of this Society.

In conclusion we may notice some changes in the last wenty years or so; a much more general employment of glass)r oil-paintings under suitable conditions of light, and for their rotection in our climate; this has to be sometimes done, as ı the Tate Gallery, by an added moulding, not improving to ıe frame. Another is the more general practice of framing ater-colour works as if they were in oil, which may properly e done when the colouring is of sufficient strength, and in all orks there seems a tendency to employ broad bevels in place f the large gilt flats and to allow the glass to cover them.

We submit for consideration some propositions arising from hat has been said:—

1. That whilst the frame should be designed with reference the picture, and may in some cases have details emblematic f the subject, it should not attract undue attention or be ccentric; rustic subjects should not be put in highly-enriched ames.

2. That the enriched mouldings of frames should diminish importance as they approach the picture.

3. That works, not of much strength in water-colour, should ave broader flats than those in oil, and not heavy gilt frames ith much burnish.

4. That some pictures (like Lord Leighton's) are best with·ıt any burnish in the frames.

5. That landscape pictures, in most cases, are better in ecessed than in projecting frames.

6. That the colour of a mount should not appear to blend ith any part of the picture it surrounds.

7. That the gold in all frames should be toned to suit the ictures.

8. That some works have their best effect in carved wood, rown or black frames, with or without fine lines of gold added.

9. That strongly-marked carved lines in frames, with corners nd centres in high relief, are often injurious to the composition f line in the pictures.

1. Inch plain oak frame, natural colour, mount deep cream, for sketch on lighter cream ground.

2. Same frame, mount warm stone, for drawing on soft red ground.

3. Same frame, flat reeded, mount 4-inch stone, coloured with ¼-inch gold band near the deep bevel, ¾-inch band of deeper stone colour next to gold, with black fine lines ruled on the gold and to outline the band.

4. Frame 1-inch reeded walnut, mount 4-inch grey-green, ¼-inch band of gold, 1-inch deeper grey-green, then another ¼-inch band of gold, lines of black on gold bands, for drawing in pencil on light cream colour.

5. A 2-inch reeded teak, coloured oak frame, ¾-inch gilt flat, for drawing on brown paper.

6. Same frame, flat of 2½-inch light unvarnished oak, deep bevel, near which is a fine gold line, and another ¼-inch wide, outlined black, for a richly-coloured sketch of King Cophetua.

7. One and a half-inch flat black-polished frame, with a groove in centre, for chalk drawing on brown paper, very narrow gold flat.

8. Inch reeded light oak frame, mount light brown, very thick, and bevel cut so as to show various layers of the paper, for drawing on cream colour.

9. One and a half-inch walnut frame, flat fluted, mount 4-inch warm stone colour, with deep plain line indented near bevel, for drawing on brick-red paper.

10. Frame 1¼-inch flat, with three grooves, green-gold, mount cream colour, band of ¼-inch green-gold near bevel, for etching in silver and gold on deep grey ground.

11. One and a half-inch frame, black, slightly elliptic, with fine gold hollows on the edges, gilt narrow flat in some cases, and in others 4-inch gold mounts, where the print or drawing is strong in colour.

12. One and a half-inch reeded walnut frame, ¾-inch mat flat, an oval inside of plain light oak, with fine gold hollow, forming sight, for portrait in black chalk on cream of light tone.

RECENT DISCOVERIES IN EGYPT.

ON the 18th inst. at University College, Professor Flinders Petrie gave the first of a series of six lectures on recent discoveries in Egypt. The subject was the discoveries made last winter in the excavations for the Egypt Exploration Fund on the edge of the desert between Dendereh and Hou. In that district Professor Petrie, assisted by Mr. Mace and Mr. MacIver, explored many ancient cemeteries, and formed a complete record of the contents of over a thousand graves. Three or four of these cemeteries were of the prehistoric age, with contracted burials like those first discovered by the lecturer at Naqada a few years ago. The same pottery and finely-wrought flints appeared as before, but many new kinds of objects were found, such as toys and models of clay, engraved slates, stone maces with handles of ivory and of horn, models of ostrich eggs, &c. From the detailed record made of many hundreds of these graves it was hoped that a classification of the various periods of the prehistoric age in Egypt would now be practicable. There was no country in which such a complete registration had been made of the earliest civilisation. Coming to the historical times the professor said that two or three cemeteries of the Vith eleventh dynasties have been also fully examined. The buttons and seals found of that age were of foreign origin and had no connection with ordinary Egyptian design. A great variety of vases in stone and pottery had been obtained, which would enable the derivation of the forms to be traced from the prehistoric times down to the twelfth or seventeenth dynasty. The entirely new discovery of the year was that of a foreign people who entered Egypt about the twelfth dynasty. Their graves frequently contained a mixture of Egyptian things of that age, but their pottery and beads were entirely foreign. The pottery was hand-made, and of red and black colours, like the prehistoric pottery, but the forms of it were peculiar to this age. It was all decorated in imitation of basket-work, and often contained funeral offerings of scented fat, like some prehistoric jars. The beads were of shell and of glazed pottery. The graves were shallow circular pan-shaped hollows, called by the discoverers "pan-graves" for distinction. A unique feature of the burials was the depositing of vases in the loose dust outside the grave-hollow, and with them often great numbers of skulls of goats and cattle. These skulls were all cut away at the back so as to hang on a wall, and ornamented with spots and lines of red and black paint. Such a use of skulls for decoration was seen on an ivory carving of about the second dynasty, where ox skulls were shown over the doors of a building, and the Greek use of bucrania in architectural ornament showed the same usage. There would be little doubt that these barbaric invaders were a branch of the Libyans, the collateral descendants of the same stock as the prehistoric Egyptians. A magnificent bronze dagger, found in a cemetery of rather later age, bore the name of King Suazenra, of the fourteenth dynasty. This was the most valuable object found, and had, of course, been kept at the Cairo Museum. Of much later age was a series of marks placed on pottery by the Roman soldiers stationed in the fortress of Diospolis Parva. These were different from

anything yet known in Egypt, and seemed to belong to some legionaries from Asia Minor, as a long inscription on a Roman potsherd was in an alphabet like that of the Karians. Of the Roman age also was a modelled head in painted stucco, which was the finest example of that work yet known. A proof of the truth of the portraiture was shown by a photograph of the modelled head, and another of the skull of the same man, adjusted together. The difference was exactly that due to the amount of fleshy covering on the skull which would be natural. The effect of the modelled portrait over the skull was that of a Röntgen ray portrait of a living person, showing the bones through the flesh.

The course of weekly lectures will include references to other excavations of the past winter, and some unpublished studies in Egyptology. Any lectures at University College can be attended without connection with other subjects, or entering any regular curriculum.

KENSINGTON PALACE.

THE palace at Kensington is not a remarkable example of architecture, but as the chief object of interest in the "old Court suburb" few would care to see it demolished. It was allowed to fall into a condition which suggested the necessity of a new dilapidations Act, for since the time of George II. the various tenants have not considered that the common law about repairs applied to them. A sum of about 23,000*l.* having been expended on removing the risks which awaited visitors, the building can now be seen by all who care to make the journey. A descriptive handbook to the palace has been prepared by Mr. Ernest Law, which gives the following account of the system adopted by the Office of Works in restoring the building.

The most studied care has been taken never to renew any decoration where it was possible to preserve it—least of all ever to attempt to "improve" old work into new. On the contrary, repairing, patching, mending, piecing, cleaning, have been the main occupations of the decorators to an extent that would render some impatient slapdash builders and surveyors frantic. Yet it has been all this minute, though no doubt sometimes costly, attention to details, this laborious piecing together of old fragments, this reverential saving of original material and work, this almost sentimental imitation of the old style and taste where patching in by modern hands was inevitable, which has produced a result and effect likely, we think, to arouse the admiration of all who relish the inimitable charm of antique time-mellowed work.

Never before, we may safely say, has the restoration of any historic public building been carried out with quite the same amount of loving care as has been lavished on Kensington Palace. The spirit has been rather that of a private owner reverentially restoring his ancestral home than that of an ordinary public official, with an energy callous to all sentiment, sweeping away the old to replace it with a spick-and-span new building. This method of treatment has nowhere been applied more scrupulously, and, we venture to think, with greater success, than in the treatment of the old oak panelling and the beautiful carving, all of which had been covered over with numerous coats of paint so long ago—we have discovered from the old accounts in the Record Office—as 1724. In the cleaning off of these dirty incrustations various processes have been resorted to, as they suited the nature of the work, and so thoroughly has this been done that the closest inspection would give us no inkling that any part, either of the flat surface or of the most delicate carving, had ever been painted at all. Equal pains were taken in finishing the surface with oil and wax polish—no stain whatever being used on the panelling, doors, or cornices—so that the real true colour of the wood is seen, varying only with its natural variation, and exhibiting all its richness of tone and its fulness of grain. It makes one almost glad it should have suffered so many years of long neglect, that when at last it has been taken in hand it should have been done when the historical significance and the technical and artistic value of such things are more truly appreciated than formerly. There can be little doubt that if an early nineteenth-century upholsterer had got hold of this palace most of the beautiful old work would have been cleared out to make way for vulgar plaster-work of white and gold.

Substantially the same principles have been followed in the cleaning and restoration of the painted walls and ceilings, which work, entrusted to Mr. Haines, has been executed with the utmost sympathy for the old work, and the most careful efforts to preserve it. There has not been a touch of paint applied except to make good portions absolutely destroyed, so that these ceilings—whatever their merits or demerits—remain exactly as they were when first completed, save for the more subdued and modulated tone they have taken on from the softening hand of time.

SHROPSHIRE ARCHÆOLOGICAL ASSOCIATION.

THE annual meeting of this Association was held Shrewsbury recently, the president (Lord Barnard) the chair, and there was an unusually large and influenti attendance, more than usual interest being taken in the meeti in consequence of the proposed further exploration of t adjacent city of Uriconium. The audience included Sir Offl Wakeman, Mr. R. L. Kenyon, Rev. Prebendary Moss, Arc deacon Maud, the Hon. W. H. Herbert and Sir F. Smythe.

The Rev. T. Auden (hon. secretary) said the Associati was in a sound financial position, but looking at the work th had before them in the future, new members were neede The chief event connected with the Association's coming ye was the exhibition of Shropshire antiquities. The council f that the time had now come when a scheme should inaugurated and carried into effect for the further explorati of the Roman city of Uriconium, a few miles from the tow The work, Mr. Auden said, was beyond the powers of loc effort, and was indeed of a national character.

The report and financial statement having been adopte Lord Barnard, referring to the further exploration of Uriconiu said it was a subject of exceptional interest. It was n possible, perhaps, or desirable that the sole burden of the wo should fall upon Shropshire, for the work was of nation importance. He proposed, "That it is desirable in t interests of antiquarian knowledge that the systematic explor tion of the remains of Uriconium should be resumed witho delay."

Sir Offley Wakeman, who seconded the proposition, sa the explorations had been long talked of, and had come to head now that they had in Lord Barnard a president who w so much interested in archæological research, and whose co nection with the site was so close.

The motion was carried with applause.

Mr. W. H. St. J. Hope, assistant secretary of the Society Antiquaries, strongly urged the carrying out of the resolutio and suggested the formation of a local committee and executive committee composed of men who have had experien in that particular kind of investigation. A guarantee fu would be necessary before the work could be commenced, a he suggested as many subscriptions as possible should obtained for a period of five years, for if the work was to done properly the expenses would be heavy. Lord Barnar the owner of the soil, had already given his consent to t carrying on of the explorations, and a satisfactory arrangeme would shortly be arrived at with the tenant.

Mr. G. E. Fox, F.S.A., gave a sketch of the explorations Uriconium which had taken place in previous years. It w believed further exploration would throw further light upon t Roman occupation of England. It was decided that a loc and London committee should be appointed.

GENERAL.

A Portrait of Christopher Columbus, by Sebastian d Piombo, is to be sold with the collection of pictures belongi to the Duc de Valençay, in Paris. When exhibited in Chica the American Government offered to give an immense sum money for the portrait.

The Late Mr. John Birch, architect, of John Stre Adelphi, has left property of the value of 3,862*l.* 6*s.* 11*d.*

A Correspondent informs us that the architect w directed the operations for the removal of the fountain in t Place du Châtelet, Paris, was Gabriel Davioud, who in 18 was appointed architect-in-chief to the city of Paris. It w not the only fountain on which he was engaged.

M. Loriot is considered to be the exhibitor who has m chance of the coveted *medaille d'honneur* for architecture the Salon. His is represented by a design for a *Salle Fêtes* and other buildings in connection with the exhibition 1900.

The New Building of the Surveyors' Institution, 12 Gre George Street, will be available for members from to-d Rooms for arbitration can be secured after May 31.

The Tapestries designed by Boucher, which forme adorned the Château de Beaulieu (Loire), have been sold to English dealer, who has paid nearly 30,000*l.* for them.

The '91 Art Club will hold their annual exhibition members' work at the Maddox Street Gallery, Maddox Stre during the first four days of June.

The Result of the adjudication upon the competitive pl for the new elementary school at Coatdyke, to be erected the Airdrie School Board to meet the demands of the rapi growing population, is that the plan by Mr. James Sh architect, Coatbridge, has been chosen, that of Mr. Willi Shanks, Airdrie and Glasgow, being awarded the second pl and premium of 10*l.*

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page x.

Accepted tenders.

Ramsay Bros., girders, wrought and cast-iron work, and electric lighting.
Chapple & Son, all other work.

THE Queen's Theatre and Opera House, Keighley, is being entirely reconstructed. The elevation in Queen Street will have a frontage of 83 feet. The auditorium will be 50 feet by 60 feet, and the whole interior, circles and all, will be constructed of fire-resisting material. The cantilever principle has been adopted, so that the view of the stage from any part of the house will be uninterrupted. The stage dimensions are 65 feet wide and 45 feet deep. The stage itself will be on a level with Adelaide Street. From floor to grid the height will be 60 feet. This part of the building is being constructed of brick, concrete and timber, and is entirely separated from the auditorium and dressing-rooms by a double asbestos fire-resisting curtain and iron doors. The internal decorations of the house will be executed in fibrous plaster, and the predominating colours will be in harmony with the prevailing shades of the draperies and upholstery. Gold will play an important part in the scheme of decoration. The style adopted will be the French Renaissance. Electricity will be employed for lighting purposes—and this, indeed, forms part of the decorative scheme—but gas will be laid on as a reserve. The building will be heated by means of the low-pressure hot-water system, whilst no precautions are to be spared in regard to the possibility of fire and the evil effects of indifferent ventilation. The contracts have been let to Messrs. Greenhow & Murgatroyd, builders, of Keighley, and operations are to start immediately. Meantime, Messrs. Kershaw & Manning have secured the hall of the Mechanics' Institute, pending the completion of the new theatre, of which Mr. F. Matcham is the architect.

TRADE NOTES.

EYSTONES PRESBYTERIAN CHURCH, co. Wicklow, now in rse of erection from designs by Mr. H. J. Lundy, Dublin, ieing ventilated by means of Mackay's patent invisible roof tilators (sole makers: Cousland & Mackay, 150 Hope eet, Glasgow).

THE Acomb Board schools, York, are being warmed and tilated by means of Shorland's patent Manchester grates patent Manchester stoves.

A NEW turret striking clock, showing the time upon three rnal dials, was set going on Wednesday, May 24, the en's Birthday, at St. Clement's parish church, Bradford, ks. The clock was presented by the Hon. Mrs. Whittuck, donor of the church. The clock was made and fixed by srs. Wm. Potts & Sons, clock manufacturers, of Leeds and vcastle-on-Tyne, the builders' work by Mr. Newell, Edinh Street, Bradford.

VARIETIES.

e ceremony of opening the new Post Office, which has n erected in Cathcart Street, Greenock, at a cost, including of about 20,000*l.*, was performed on the 22nd inst. The ding, erected from designs by Mr. W. W. Robertson, Her esty's Board of Works, Edinburgh, is in the Renaissance e of architecture, and is one of the handsomest in Greenock.

URING a heavy thunderstorm which passed over North Notts it noon on the 23rd inst. the lightning struck Welbeck Abbey, seat of the Duke of Portland. The whole of the lead-work ripped away from the turret clock, and many of the squares lass in the windows of the grand dining-room were shed. No further damage was done. Fortunately no one injured.

THE *Pall Mall Magazine* for June is bright and interesting usual. It contains contributions by F. C. Burnand, H. G ls, Mrs. Belloc-Lowndes, Edgar Jepson, H. B. Marriott-son, W. Clark Russell, G. S. Street and others. The illustions are numerous and artistic, and notable among them a series of exquisite little sketches by Herbert Railton, h appear in connection with an interesting article on me Bridge Chantries," written by Francis Crowther.

THE Duke and Duchess of Connaught will open the hospital erected at Woodford, Essex, to commemorate the Diamond Jubilee of Her Most Gracious Majesty Queen Victoria on June 1; the Lord Mayor of London and Sheriffs will also be present. An endowment fund has been generously subscribed for by the inhabitants of the neighbourhood, and Mr. J. R. Roberts, J.P., of Woodford, kindly presented the land, hospital, and all internal fittings, which are of the most modern and approved design. The architects are Messrs. J. Kingwell Cole & Kenneth Wood.

A NEW Wesleyan chapel was opened at Wortham, near Diss, last week. The new building stands on the site of the old one, and is of red brick, the interior being comfortably fitted. Mr. Isaac Osborne, of Diss, was the builder, and the cost was 281*l.* 15*s.* 6*d.* The new chapel and schoolroom, the latter being connected with the chapel by sliding doors, afford accommodation for upwards of 200 persons.

THE British consul at Ispahan, whose report on the condition of his district for the past year has just been published, says that almost the only public work going on is the destruction of the lovely old Sefavian buildings in Ispahan. Nearly all the old palaces, gardens and places which made Ispahan so renowned in the sixteenth and seventeenth centuries, and which even up to twenty years ago were the delight of the traveller, have disappeared. The Chehar Bagh, with its quadruple avenue of chenar trees, its kiosks, basins and waterways, is now practically a wilderness.

THE new drill-hall for the Gourock Company of the 1st Renfrew (Volunteer Battalion) A. and S. Highlanders was formally opened on the 17th inst. The building, which is situated at the north-east corner of the public park, is 104 feet in length by 48 feet in breadth, with a height of 27 feet, and is built of red brick. The hall proper is 70 feet in length and 46 feet in breadth, and the remainder of the erection is taken up with officers' quarters, men's reading and recreation-rooms, and the instructor's house, which has a frontage to Binnie Lane. The house is a commodious one, and the recreation-room, which is 35 feet by 12, will be furnished in a suitable manner. The hall will cost 1,500*l.*

THE annual general meeting of the Glasgow and West of Scotland Master Plumbers' Association was held on the 17th inst. in the Building Trades' Exchange, 30 Gordon Street. There was a good attendance of members. The president, Mr. J. T. Renfrew, occupied the chair. The secretary in his report,

among other matters, referred to the large increase in the membership of the Association, the number being now 160, as compared with 135 last year. The treasurer reported that the funds of the Association now amounted to about 800*l.* The office-bearers for the coming year were appointed, and are as follow:—President, William Mackie; vice-president, Samuel Cowan (Ayr); hon. treasurer, Thomas Day; and secretary, John Wylie, writer, 204 St. Vincent Street.

THE members of the London and Middlesex Archæological Society intend visiting St. Albans on Saturday, the 3rd prox. The party will be conducted by the Rev. Canon Benham and Mr. William Page. The chief places to be visited are the cathedral, St. Michael's Church and the walls of the Roman city of Verulam.

AN early start is to be made with the work of the new bridge at Kirkcaldy, which is estimated to cost between 13,000*l.* and 14,000*l.* The contractor for the work is Mr. Alex. Fraser, jun., and Mr. Galloway has just been appointed clerk of works. The bridge is to be built from designs by Mr. W. D. Sang, C.E., Kirkcaldy. The main object of the new bridge is to form a connection on the high level between the second and third wards of the burgh.

CARNEGIE HOUSE, erected at Montrose Asylum for the accommodation of private patients at a cost of about 20,000*l.*, has now been formally opened. The house, which is named after Miss Carnegie of Charleton, who was the initiator of the movement which founded the asylum in 1782, was commenced four years ago in order to alleviate to some extent the overcrowding of the main asylum, which at present is occupied by about 660 patients. It is plain externally, but everything inside tends to the comfort of the inmates, and it is more like a country mansion than the adjunct of an asylum. It is heated by the Sturtevant system and lit by the electric light. The engineering works in connection with Carnegie House, as well as similar other works in course of execution at the asylum, have been designed and supervised by Mr. T. Young, consulting engineer, Glasgow.

THE first meeting for the year of the Architectural and Archæological Society of Durham and Northumberland will be held on Friday, June 2, at Richmond and in Swaledale. Members will assemble at Richmond station at 11.50. They will drive to Marske, where the ancient church will be examined, and from there to Marrick Abbey, the ruined tower and choir of which still remain. Proceeding up the dale, Grinton Church will be visited; it is principally of the fifteenth century, bu retains some original Norman work. Returning by the sout bank of the Swale the fragmentary ruins of the small conventua church of Ellerton will be seen, and on arriving at Richmon the remaining time will be spent at the parish church, Trinit Church and Greyfriars Tower. The whole of the drive i through an extremely beautiful and interesting countr Members will dine at the King's Head.

THE removal and enlargement of the Emperor's Berli stables, which are opposite the old palace at the corner c Breite Strasse and the Schlossplatz, will cost from seven t eight million marks. According to the plan of the architec Herr Geheimrath Ihne, the front facing the Spree will b 200 yards in length. The Emperor requires, amongst othe things, two riding grounds, several coachhouses for about 30 carriages and stalls for 270 horses. Several work yards an farm yards are also needed, as well as dwellings for 50 familie and 80 unmarried servants and coachmen. The chief façad opposite the Schloss required reconstruction on a large scale and this was rendered very difficult by the different characte of the rooms looking on to the Schlossplatz, some of which ar quite insignificant. The architect has, however, been fortunat in his design, having arranged the chief room of the uppe floor (the large carriage-room, with its costly historical an modern sleighs and coaches) as a State-room, thereby givin it the appearance from the outside of a museum.

A NEW and commodious Constitutional Club, situated i the Military Road, Chatham, was opened last week. Th building, which is plain in character, is executed with whit Suffolk bricks and Bath stone dressings. There are tw reading-rooms, one of which communicates with the ba Beneath the bar and the reading-room is the cellar, and th accommodation on the ground floor also includes a secretary' room. On the first floor are two spacious card-rooms, eac with a bay window, through which the balcony can be ap proached, and a billiard-room with two tables. The secon floor is exclusively taken up by the steward's quarters, whic constitute bed and sitting-rooms, kitchen, pantry, stores, &c An important adjunct of the Club is the Queen's Hall, at th rear of the other part of the building. Its dimensions ar 53 feet in length, with a width of 34 feet, and it will seat 35 people. The main entrance is from the Military Road, on th left of the Club premises, but there are also two entrances a the back from the passage-way which leads off from Nelso Road. There is an ante-room as well as lavatories in connec

TO ARCHITECTS, SURVEYORS, &c

The Original Patentees and Sole Manufacturers of the MICA VALVE CHIMNEY BREAST VENTILATOR (patented by Comyn Ching & Co. under the name of "Thomas Boyle's Patent") having suffered for some time past by WORTHLESS IMITATIONS being supplied to Builders and others, which are badly fitted with inferior materials, neither Smoke-proof nor Proof against back-draught, are very noisy in action and soon get out of order,

Beg to call the attention of the Profession to the following fact:—

The only Perfect Ventilators have the Patentees' MONOGRAM CAST IN the front, and the only GUARANTEED NOISELESS is Ching's NEW PATENT SILENT Chimney Breast Ventilator with the NAME and MONOGRAM CAST IN.

TRADE MARK.

Any Infringement of the above Patent or Trade Mark Monogram will be subject to an action at law.

ARCHITECTS SHOULD SPECIFY

CHING'S New Patent Silent Chimney Breast Ventilator.

TO BE HAD OF ALL IRONMONGERS AND VENTILATING ENGINEERS IN THE UNITED KINGDOM.

with the hall. At the Club end of the hall is a permanent form, with a roomy balcony overhead and a ladies' retiring-n. The building is heated by hot water on the low-pressure em, at a cost of 124*l.* The building has been erected at a tract price of 2,885*l.*

A NEW Conservative Club, which has been erected at diff from the designs of Messrs. Veall & Sant, was opened the 16th inst. by Mr. Winston Churchill, son of the late d Randolph Churchill. The structure, which is of simple ation, has a frontage to Neville Street of 28½ feet, and to Burgh Place of 100 feet. It is erected on land leased from Marquis of Bute. The materials are Newbridge stone and bon red pressed bricks for the facings, with Bath stone ssings. The centre gable to Neville Street is of solid -timbering, the panels being filled in with ornamental k by Mr. Wormleighton. The side entrance is in Forest e, with a massive carved Bath stone balcony. On the und floor there is a wide entrance hall, reading-room, bar, ard-room and lavatories. A wide and handsome staircase itchpine and teak leads to the first floor, where there is a e assembly-room, with an outside approach from the street, an ante-room. The assembly-room can be divided by ns of a sliding partition. There are also on the same floor rge committee-room, kitchen, scullery and offices. On the nd floor are situated the steward's apartments, with bath-m, &c. There is in the basement ample cellarage and a tle alley. These are well lighted, so that artificial light will be required in the daytime. The internal fittings through-have been carried out in a substantial and very creditable ner. The contractors are Messrs. Melhuish Brothers, diff. The cost of the building was about 2,700*l.*

AT a special meeting of the Colchester Town Council last k, Alderman Jas. Wicks presiding, the new town hall com-tee reported that the architect had written stating that with ard to the Victoria Tower there would be no difficulty in nging for the clock and chimes, which had been presented he Corporation, the cost involved being 300*l.* The additional of the Portland stone over the Owen stone for the tower ld be about 300*l.*, and he would very much prefer the ner. Consideration of the matter had been deferred.

BUILDING AND BUILDERS.

A NEW police-station is to be built at Chapeltown, N.B. A site is to be purchased for 2,500*l.*

A TERRIBLE building accident is reported from Crefeld, Germany. The wall of a house in course of construction fell in without a moment's warning, and twelve workmen were killed. The two contractors were severely injured.

THE foundation-stone of a new public hall for Pitlochry was laid on Thursday last. The building is designed to accommodate 600 persons, and is estimated to cost about 2,500*l.*

WHILE working on the chimney-stack of a house at Peterborough on the 20th inst. a bricklayer named Bird was killed through the breaking of the scaffolding. The body first struck the roof of the house and then the roof of the outhouse, from whence it rebounded to the ground. The tiles of the roof were broken, and deceased's head was terribly gashed.

AT a meeting of the Hull property committee, the Town Hall sub-committee reported that they had considered the resolution passed by the City Council with reference to the proposed extension of the town hall. The city engineer was instructed to prepare and submit plans and sections of the existing hall and site and buildings connected therewith, and that the engineer also report as to what further accommodation it would, in his opinion, be necessary to provide.

THE foundation-stone of the new schools in connection with St. Andrew's Church, Wolverhampton, was laid on the 13th inst. The scheme for the new building will entail a cost of about 4,000*l.*, but at present it is proposed to build only rooms to accommodate about 600 girls and infants. The school will be two storeys high, and the upper floor will be used for the girls. The front of the building will have an imposing appearance with three gables, and special arrangements are made to enable the children to leave the school rapidly. The material used in the walls will be red brick with Hollington stone dressings, and the roof will be covered with tinted tiles, while internally the walls will be covered with enamelled bricks, and the fittings will be of pitch pine. The designs have been provided by Mr. F. H. Lynes, and the builder is Mr. J. Herbert, both of Wolverhampton.

MR. W. A. DUCAT, Local Government Board inspector, has held an inquiry at the Oldham Town Hall into the application of the Corporation for power to borrow 14,209*l.* for the erection

of refuse destructors at Hollinwood and Robin Hill, and 12,335*l.* for the erection of public baths at Hathershaw and Lowermoor. Mr. A. Nicholson (town clerk) informed the inspector that the Corporation already possessed a destructor at Rhodes Bank, and public baths in Union Street (Central), Hollinwood and Waterhead. The destructors would result in a considerable saving in the cartage of refuse from the extremities of the town. The baths were urgently required, and the sites chosen were in districts which were well populated and were still growing. There was no opposition to the application, and after the inquiry closed the inspector, accompanied by members of the Council, visited the sites of the proposed buildings.

THE foundation-stone of a new church in Grange Road, Bradford, to be known as the church of St. Columba, has been laid. The architecture is Early English, and the nave will be 79 feet long and 24 feet wide, with aisles on each side 11 feet 6 inches wide, from which there will be projecting transepts on the north and south sides. At the west end the plans show there will be a vestibule about 8 feet long, with a similar width to that of the nave. On the north side there will be a chapel 35 feet long and 17 feet wide, which will be utilised for special occasions and week-day services. On the opposite side, or the south side of the chancel, there will be the organ chamber, as well as vestries for the clergy and choir. From this portion there will be a staircase which will lead to the basement, which will be furnished as parish rooms. The fall of the ground will afford splendid light, through windows which will be above the ground level. The church will be built of local stone, with a roof of Westmoreland slate, and will have a turret which will be 65 feet high and have a diameter of 9 feet, and this will be octagonal in shape, at the foot of which there will be an entrance to the parish rooms. The architects, Messrs. T. H. & F. Healey, have executed plans for a church which will be well lighted by leaded windows of an ornamental character. The sittings will be of pitch pine, but the chancel as well as the communion table will be of oak. The pulpit and font will be of stone.

A SYNDICATE has been ormed at Ripon for the purpose of carrying out extensive building operations and to meet the increasing demand for villa residences, hotels and hydros. Lord Ripon has sold two sites on the west of the city, the one being on the high ground overlooking the cricket-field on the Studley Road and having a charming prospect in the direction of Studley Park. Here it is proposed to erect a large residentia hotel, which will stand in its own grounds of 5 or 6 acres, and where, if the Corporation are successful in securing the Aldfield Spa, it is hoped sulphur water may be laid on to provide baths for visitors. The 24 acres of land purchased from Lord Ripon to the south of the cricket-field is to be laid out for villa resi dences, and eventually a new road in the direction of Studley may be opened between Skellbank and Bishopton, which would be an alternative route to Fountains Abbey for visitors from Harrogate.

THE scheme for a new Congregational church at Swinton which is to cost about 1,700*l.*, and is to be built in front o the existing premises, to face the main thoroughfare, is being vigorously pushed forward. The new church would have been commenced some time ago but for a difficulty with the Charity Commissioners concerning the sale of the old Independen chapel. The assurance has been received that the old building can be sold and the funds applied to the new chapel, on condi tion that any mortgage raised on the property be paid off in thirty years by annual instalments of principal and interest The amount to which the Commissioners will allow the church to go in the way of mortgage is from 900*l.* to 1,000*l.*

THE Coventry City Council have passed plans for the erection of a new fire station on the Pool Meadow, in further ance of the scheme which has been under consideration for two or three years past. The new buildings are to be placed upon a portion of the site now occupied by the old baths, and will be sufficient for the requirements of the city for some years. They will be complete and up to date in every detail, and will be fitted with the most modern time-saving appliances for harness ing the horses, opening doors, &c., and will enable the efficient volunteer fire brigade to turn out in the smartes possible manner. The erection of the fire station will necessi tate the demolition of the old baths, and such part of the site as is not required for the fire station will be added to the Poo Meadow. About a thousand square yards of land is at presen enclosed, and of this not more than 350 square yards will be utilised for the new buildings. The front will abut on Hale Street, but will be set back somewhat so as to allow of an improvement in the street line at that point, and at the adjoining bridge over the Sherbourne. The erection will be of brick and slated, with stone dressings at the front elevation. On the ground floor there will be an engine-room 40 feet by 32 feet in extent, capable o receiving three steam fire-engines with hose-reel, and adjoining

will be the room for the men on duty, in which the phone and electric alarms will be placed. Stabling accommodation for six horses is planned, with harness-rooms, hay corn stores, an isolated loose-box, and a workshop for hauling and repairing the engines and appliances. It is proposed to cover a portion of the yard for the purpose of . Above the fire-engine room will be a recreation-room, an apartment for the committee and bathroom and story for the men. The erection of a tower 70 feet high for ing the hose is also contemplated. At present this portion he apparatus is dried in the open air, a somewhat unsatisory and ineffectual method, under which the hose very kly deteriorates. The whole of the buildings, including drying tower, will be heated with hot water. Adjacent to fire station there will be three cottages, for the permanent ineer to the brigade, who will have charge of the station, ines and appliances, and for the two horse drivers. Proon is also made for pumping water for street watering from existing well on the premises, as this is found to be a very able addition in summer to the ordinary supply. It is mated that the cost of carrying out the entire scheme will ount to about 5,300*l.*

A NEW hospital for women is about to be erected in ds. The existing building, which was originally a private dence and has for some years been used as a hospital for nen and children, has become quite inadequate, and will, en the new premises are erected, be devoted exclusively to purposes of a children's hospital. The exterior of the build- will be simply treated. Inside, however, all will be as com- e and well arranged as hospital experience can suggest. e out-patients' department will comprise an entrance-hall, a ge waiting-hall, an examination-room and two consultation- ms, each with ante-room and dressing-room attached. ere will likewise be a dispensary and drug store, accommoion for the hall porter, a room in which perambulators may placed and lavatory accommodation. The arrangement of se several apartments is such as to obviate, as far as practile, confusion. The women's hospital will consist of three ds, each with eighteen beds, and four single wards. On h of these three floors there will be a day-room a ward scullery. The principal ward will likewise have attached a well-lighted operating-room, with an anæsthetic-room and recovery-room. A lift sufficiently large to take up a patient and bed will be provided. The ground floor of this department will be occupied by the administrative rooms, including board-room, waiting-hall, reception-room, accommodation for the medical staff, the house surgeon, the matron and nurses, and the kitchens. The boiler, engine and laundry, &c., will occupy the basement. The maternity department, occupying the first and second floors of the building devoted to it, will contain four wards, each with four beds, or sixteen in all, and the arrangement will be such that each ward, in case of need, can be isolated. Other necessary accommodation will be provided, including a small isolation hospital with disinfecting apparatus.

THE new halls which the Glasgow Corporation have decided to erect for the Springburn district will occupy a prominent site at the corner of Millerbank Street and Keppochhill Road. Included in the design are two halls placed together longitudinally, and so arranged that while the entrances, exits and retiring-rooms for each are quite separate and distinct, they may be let together and used en suite when occasion requires. The main hall measures 77 feet by 50 feet, exclusive of crush hall and orchestra, and provides comfortable seating accommodation for 1,209 persons. The principal entrances are from Millerbank Street, and open into a spacious crush-room, from which any part of the hall may be reached. Ample exit accommodation is provided at each end of the hall, both from area and gallery levels. In the dividing wall between the two halls are two sets of double doors, which will be opened when halls are used en suite. The platform entrance is from Keppochhill Road, and communicates by means of a corridor under the platform with the retiring-rooms which overlook the lane. On the ground-floor is a committee-room, which will be used as a platform or green-room, while immediately above are situated the dressing-rooms for the artistes. There is a cloak-room in connection with the ladies and gentlemen's retiring-rooms in the basement. In the basement under the main hall a large store for forms, &c., is provided, together with three committee-rooms, which are placed so that they are lighted and ventilated to an area to Keppochhill Road. It is proposed that these rooms should be divided by movable

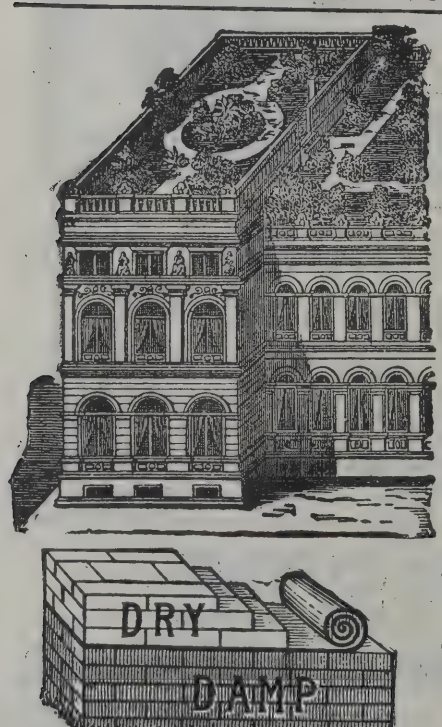
partitions. The lesser hall measures 52 feet by 27 feet, and provides seating accommodation for 408 persons. The principal entrance is from Millerbank Street, and from the entrance hall a staircase leads upward to the gallery and downward to basement. There are emergency exits at each side of platform. The kitchen is placed in the basement under the lesser hall, and a lift for the convenience of purveyors is provided from the kitchen corridor to the service lobby at the south side of platform. The corridors in the basement are of ample width, and are so arranged as to facilitate communication with the various staircases. It is proposed to heat the building with low-pressure steam, in pipes, coils and radiators. Electric fans placed in the roof will draw off the foul air, and fresh air will be admitted behind the heating coils. All sanitary appliances will be of the latest type. The main roofs will be carried on steel principals, and it is proposed that the balconies shall be supported on steel cantilevers built into the wall. The materials for the exterior will be red freestone for walls and green Westmoreland slates for roofs. The total cost of the building is estimated at 11,404*l.* Mr. W. B. Whitie is the architect.

ELECTRIC NOTES.

THE Bill confirming the electric-lighting provisional orders with reference to Alloa, Dumfries, Inverness and Kilmarnock has been passed by the committee of the House of Commons on unopposed Bills.

AT a ratepayers' meeting in Heckmondwike the District Council's electric-lighting scheme, prepared by Mr. Hawtayne, consulting electrical engineer, London, was approved. The scheme was explained by Mr. S. Wood, who moved the resolution of adoption. Mr. Lewis Shaw seconded, and the motion was supported by Mr. T. Redfearn, and carried with only a few dissentients.

EARLY on the morning of the 14th inst., before traffic commenced, the electrical machinery for actuating the wedges and turning the Navigation Bridge, recently erected by the Weaver Navigation Trustees at Northwich, was tested for the first time with highly satisfactory results by the contractors—Messrs. Mather & Platt, of Manchester—in the presence of Mr. J. L. Saner, the engineer to the trustees, who is responsible for the works. This is the first instance in Great Britain of a swing-bridge being worked by electric power.



IN connection with the electric-light extensions, additi to the generating stations in Coventry, which are being m under the direction of the city engineer, are proceeding sa factorily. The new buildings are now well above the gro line, and will probably be completed within the next months. The sub-stations for transforming purposes in diffe parts of the town have also been finished. For the lightin the main thoroughfares of the city by electricity the wires h all been laid and the standards erected. Practically all remains to be done is the production of the arc lights.

THE electric-lighting committee of Edinburgh Town Cou have decided, on a representation by the resident electr engineer, to recommend the extension of the electric-ligh subway from Picardy Place to Little King Street, at a prob cost of 1,500*l.* They also recommended the acceptanc several estimates, among which was one for the supply "feeders" amounting to over 18,000*l.*, and another for w in connection with the erection of water tanks at Dewar P station, amounting to over 500*l.*

COLONEL C. H. LUARD, an inspector of the Local Gov ment Board, held an inquiry on the 19th inst. at the Sall Town Hall with reference to an application of the Corpora for permission to borrow 5,822*l.* for electric-lighting purpo and 4,000*l.* for the building of a public hall, library and readi room at Irlams-o'-th'-Height. Mr. L. C. Evans, acting t clerk, who appeared for the Corporation, said it was propo to build an electric-lighting station on some land in Strawb Hill Road. This land had been purchased with the consen the Local Government Board. It was originally the prop of the Lancashire and Yorkshire Railway Company. Corporation were obliged to construct an abayment in Manchester, Bolton and Bury Canal so as to allow boats stop at the place without obstructing the traffic, and they l also to build a retaining wall. The Corporation proposed widen the road and erect a generating station.

MR. JOHN W. HILL, consulting engineer to the Delaw (Ohio) Water Company, has just issued a report with regar electrolysis of water pipes. He says:—With reference to electrolysis of the cast-iron mains in streets where the elec railway is placed, I was enabled to make a number of tests electric current in the water mains, at different points, wh the transfer of current from the rails of the track to the wa main, and from the latter back to the rails was most likely occur, and from the data so obtained I am inclined to th

PATENT
VULCANITE ROOFIN

Since the introduction of the patent Vulcanite Roofing into this country it has been o by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hos Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and m than under any other roof. When properly laid repairs are never required, and all ri guaranteed. The roof-surface can be used as a garden, or for any other purpose. The construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRI TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width inches, being more convenient than the usual damp-course slabs, and saving laps. Price lo quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., a SARKING under slates or tiles, manufactured in five different qualities and in rolls of 1 su ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and req annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

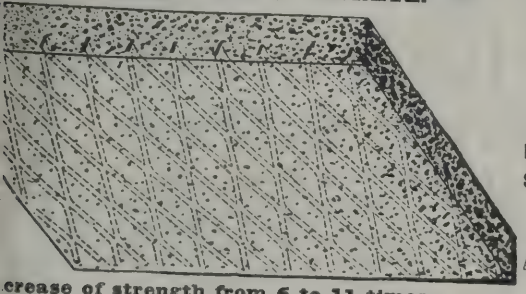
no serious damage to the water pipes has thus far occurred. h destruction by electrolysis of several galvanised iron e pipes near the power station of the electric railway can counted for by their acting as electrodes to transmit the nt from the water main to the rails of the street railway. e services are, in all cases but one, connected to the main d the rails. Within the year the rail joints of the electric ay have been rebonded, and the rails crossbonded with r conductors, since which time no service pipes so far as n have been injured by stray electric currents. Nevertheie advises that steps should be taken at an early date to rly connect, with copper conductors of suitable size, the mains with the negative or receiving poles of the electric rators.



ON AND EXETER ARCHITECTURAL SOCIETY.

following report was read at the annual meeting of the Society :—

is satisfactory to know that our list of membership has ly increased, and now stands as follows :—Members, 45; ate members, 9; associates, 13; honorary members, 4—71, as against a total of 68 in 1898. One of the members Council (Mr. G. Soudon Bridgman), having retired from ce, has resigned, Mr. J. E. Harvey being elected by the il to his vacant seat. Since the annual meeting, held at r on May 7, 1898, there have been held six general gs and seven meetings of the Council, when many rs of professional interest have been dealt with. The ects' Registration Bill, and the attitude of the various es in relation thereto, has been a source of considerable pondence. Communications have been made with the Institute, the Society of Architects, and the various societies, from which it would appear that, while the A., the Leeds and Yorkshire, and the Birmingham ies are against the Bill, the Society of Architects, the e Institute, the Northern Architectural, and the Sheffield ies are in favour of it ; while the remaining societies are neutral or have not given a definite answer. The New Wales Allied Society "intend shortly to endeavour to the introduction into the Parliament of this Colony of a ving such (Architects' Registration) for its object." But of the manner in which much of the building work is ed in this district, your Council feel strongly that some steps should be taken to safeguard the interests of not only the profession but the public at large. The Council have had before them the "Administration of Building By-laws in Rural Districts" ; also communications from the Birmingham Architectural Society with regard to "Building By-laws and their Administration" ; the new building by-laws for Exeter ; the Tavistock Road (Plymouth) competition ; the St. Thomas's Board Schools competition, as well as those for the Okehampton new workhouse and Totnes cottage hospital. The advice of the R.I.B.A. has been asked as to the extent of the liability of architects under the Workmen's Compensation Act, 1897. This has been referred for counsel's opinion. The prize offered by the Society for the best sheet of measured drawings has been awarded to the only competitor, H. E. Roskruge, Devonport. The Council are glad to be able to state that the balance in hand amounts to 8*l.* 14*s.* 11*d.*, which is principally owing to the saving and profit accruing from the publication of the extended annual reports, amounting in the last two years to over 13*l.* In accordance with the rule, three members of the Council—Messrs. King, Bridgman and Tait—would retire ; but Mr. Bridgman having resigned, his place was filled by Mr. J. E. Harvey. Messrs. King, Harvey and Tait are eligible for re-election. The Plymouth, Devonport and Stonehouse branch has been doing useful work, especially in connection with the competition for the Tavistock Road building scheme, the conditions of which were so manifestly unfair, from a professional standpoint, that representations were made to the Corporation of Plymouth with a view to their modification. The Corporation, however, would not accept the suggestions, and in consequence no practising architect of the three towns (with the exception of a junior member of the profession who is not a member of this Society) took part in the competition, and Mr. Crickmay, R.I.B.A., who was asked by the Corporation to act as assessor, declined the appointment. The branch report their funds to be in a satisfactory condition.

The president, Mr. Crocker, in his address expressed their congratulations to Mr. Cameron, the Exeter city surveyor, whose genius had apparently solved the great sewage question and turned it into an effluent of the most tempting appearance. He alluded to the admittedly rare bestowal of titular distinctions upon members of their profession, but did not think the matter of much consequence, except as a gauge of the conception existing in certain quarters of the national importance of architecture. Dealing with the question of architectural educa-

tion, he said he would extend the usual month on probation to three months at least, during which time everything possible should be adopted to discover what sort of a man the pupil was likely to make. If he showed no special aptitude it was hardly necessary to say that it was much better he should go home. After a reference to the question of the amount of personal instruction which could be reasonably expected from the principal to the pupil, the president went on to speak of the Architects' Registration Bill, which had passed its first reading in the House of Commons. Its object was set forth in the first clause:—"Whereas it is expedient that persons requiring professional aid in architecture should be enabled to distinguish qualified from unqualified practitioners," &c. It was said by objectors that artistic qualifications could not be tested by examinations, but surely that was only partially true, for the proportion of marks given by the R.I.B.A. for literary and artistic subjects was very large in comparison with those given in the other branches. Another objection was to indiscriminate registration. That seemed to him very much like arguing that if an evil be great it must nevertheless not be arrested. Again, there was a third objection to any endeavour to protect the public. It was urged that if the public were satisfied with their choice and with what they got, well and good. But were they? He confessed, however, that he had more sympathy with the last objection than with any other. When he turned to the advantages of the Bill, he spoke with no affectation of self-deficiency. It had been felt that architecture ought to be redeemed from he possibility of any person designating himself architect who possessed no other qualification than, as someone put it, "the ability to pay for a brass plate." It appeared to him that the men in whose power it was either to place a blot on the landscape or to dignify the city, ought, in the best interests of a noble profession, to be amenable to some scientific or artistic standard. It was largely for the architects of the country to say whether the highest interests of architecture were best respected and secured. The R.I.B.A. still stood aloof, and in considering the question they must, of course, place all personal interests last and keep only the highest objects before them.

A vote of thanks to Mr. Crocker for his services as president during the year was cordially adopted, on the motion of Mr. Coles, seconded by Mr. Hine.

Mr. Ralling proposed the election to the presidency of Mr. C. King.

This was seconded by Mr. Luff, and unanimously carrie

In accepting the office, Mr. King returned his thanks fo honour conferred upon him, and promised to do all in power to promote the interests of the profession during coming year.

Mr. C. J. Tait, of Exeter, was appointed vice-presid and Messrs. Penn, Harvey and Luff were elected membe the Council.

Thanks were expressed to Messrs. Reed and Shires, general secretary and secretary of the Three Towns' bra respectively, for the assistance they had rendered to Society during the past twelve months.

PATENTS.

[*This List of Patents is compiled specially for this Journa Mr. G. H. Rayner, of the firm of Rayner & Co., sulting Patent Agents, 37 Chancery Lane, London, W from whom all particulars and information relatin Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

9625. Benjamin Robinson, for "Improvements in manufacture of glazed or fireclay bricks and the like."

9669. Emmanuel Brogneaux and Henri Steven, for "I provements in rotary presses for the manufacture of bricks conglomerated articles in general."

9771. Reginald Haddan, for "Improvements in t bricks."

9816. Charles Woodbury Stevens, for "Processes fo manufacture of artificial stone."

9946. Joe Hirst, for "Improvements in the method of in means for paving."

10048. Hendrick Ludeling, for "Improvements in roo tiles."

10075. Paul Cornelius and Moritz Kluge, for "Imp ments in and relating to grates and furnaces."

10102. John Gill, for "Improvements in extractors chimneys and other places."

The Architect.

THE WEEK.

When the print of Rosa Bonheur's *Horse Fair* appeared n Gambart's window it was taken as a revelation. andseer's and J. F. Herring's well-groomed steeds eemed to belong to a different species from the powerful nimals that were exhibited in the neighbourhood of Paris. he interest was magnified when it was found the painter as a young woman. In those days there was little nterest taken in French art, and English amateurs were ot aware that the artist had gained a reputation by a succession of able works in the Salon. Mdlle. Bonheur was ne daughter of a painter, who had to sacrifice his future to ne necessity of providing for a numerous offspring. Yet e was unable to do more for Rosa than to apprentice her o a dressmaker, for she showed no willingness to study. ut sewing was as hateful to her as reading. Accident evealed an inclination towards sculpture; then colour btained supremacy over form, and she became a copyist n the Louvre. Next she took to landscape painting, and nally sheep became her models. The family lived on the xth floor of a house in the Rue Rumford, Paris, and there sheep was installed. As her skill increased she was tracted to the abattoirs, and attended one three times a week. n 1841 two of her pictures were seen in the Salon. But er works were not appreciated until the *Bœufs du Cantal* as purchased by an Englishman, and immediately afterards Rosa Bonheur was awarded a first medal. The rench Government also gave her a valuable Sèvres vase. n 1849 two of her paintings were purchased by the State, ne being the well-known *Labourage Nivernaes.* She ould then afford to be eccentric, and to wear a masculine rb whenever she passed beyond the fortifications. She llowed herself no relaxation. The original of Schaunard the "Vie de Bohème," described her as "l'ascète du avail et de la vertu." She remained what she was in 849 up to her death on Friday last, in her cottage at By, ear Thommery, Fontainebleau. Only a few days had apsed since she had declined to allow her name to be ntered among the candidates for the *médaille d'honneur* of e Salon. Rosa Bonheur had lived for seventy-seven ears, and during fifty of them she had accomplished an nount of work that entitles her to be ranked with the eat animal painters of Holland. Her extraordinary ccess was attributed by her to constant labour rather than genius.

A week ago the designs for the memorial of Louis rançais, the landscapist, were exhibited at the Ecole des eaux-Arts, Paris. It did not require long to make a lection. The model of M. Peynot was unanimously lopted, an event which is rather unusual in art competitions. The site of the memorial is to be at Plombières, a spot which commands a view of fine scenery. . Peynot has designed a half-length portrait of the artist, nich enables the arms to be represented; one hand holds pencil, the other a palette. Français appears to have s gaze rivetted on the beautiful scene before him. The st is flanked by two symbolic figures. One is Painting, no is draped, and presents laurels, palms and flowers to e artist. The second is an undraped girl, who plays on a pe, and stands for nature. The combination is appropiate, for there was something of an antique spirit to be ced in the works of Français. Whether he employed lours or crayons he was always a stylist, and enhanced e subjects he represented.

As we anticipated last week, the coveted *médaille honneur* has been awarded in the section of architecture the salon to M. Loviot, for his design for a salle des fêtes. painting M. Tattegrain has been successful. The rk which gained the distinction was a scene from the ack on Saint Quentin by the Spaniards. Originally e artist was known as an engraver, but he now produces ry large historical pictures, which are remarkable for the tention given to costume. His *Entry of Louis XI. into aris* won him a reputation, which is sustained by this ar's *Exodus*. In sculpture the successful artist is M. Ernest Dubois, but M. Boisseau was within two votes of the majority. M. Lecouteux obtained the medal in the section of engraving and lithography. MM. Hannotin and Boütron have obtained medals of the first class in architecture, and MM. Maistrasse and Berger have been recommended for a similar distinction. The second class were awarded to MM. Chaussemiche, Laborey, Balleyguier, Chaussepied, Héneux, and third-class medals to MM. Bélesta et Thillet, Bourdillat, Sansaulieu and Guinot.

On Wednesday the application for a faculty to allow of the sale of the forecourt of St. Dunstan's in the West was heard in order to enable the Law Life Assurance Society to extend their offices. It was stated by counsel that the building of the church was commenced in 1831, and it was consecrated in 1833. The Law Life office was erected at the same time, and by the same architect, and the building harmonised with the church. If the new plans were approved the proposed extension over the forecourt would maintain that harmony. At present there was no proposal before the Court to fill up or occupy the forecourt on the east side, but the idea was to devote the proceeds of the sale of the site on the west of the tower to the ultimate erection of a rectory house on the east. But that part of the scheme is in abeyance until questions of ancient lights are arranged. The sum to be paid is 4,500*l.* There was no opposition on the part of the vestry or any of the parishioners. It was maintained that the general effect of the scheme in its entirety would not be detrimental from an æsthetic point of view. The tower would simply be flanked by buildings in architectural harmony with it on either side. Evidence was given by Mr. Clifton and Mr. Caröe. The Chancellor declared his readiness to grant a faculty, but intended to visit the site to determine what provisions would have to be made to meet the requirements of the case.

If the plasterers have at last succumbed, it was owing not only to the resolution and union of the builders, but in a large measure to the failure to find allies among the other building trades. The latter may have considered the time was not ripe for a great strike, but at present we can assume that the policy of allowing the plasterers to remain isolated was dictated by good sense. At present there is the consolation of an assurance that a year in which the losses of its predecessors can be compensated will be allowed to run its course without any social obstacle suddenly appearing. The conference between representatives of employers and plasterers was held in London on Tuesday. A chairman was found in Mr. E. T. Cook, of the *Daily News*, who was without any interest to make him partial to either party. It was decided that the cause of all the woe, viz. the claim that only foremen who belonged to the Plasterers' Association should be employed, must be formally abandoned. The determination of the number of apprentices is to be referred to a special joint committee, but it was suggested that the difficulty could be solved by means of a provision for having every apprentice legally bound. The men have resolved to avoid boycotting and blacklisting in all cases where the employers adhere to the rules, and the employers have undertaken to strictly enforce the rules in all parts of their contracts. Joint committees are to be established in various districts to define the demarcation in cases where there is any dispute between plasterers and other trades about the right to do certain classes of work. Pending reference to the committee, there is to be no strike or lock-out. In cases of objection on the part of members of the Plasterers' Association to work with non-members who had made themselves specially objectionable, notice is to be given, and a truce of six days is to be allowed to enable representatives of masters and men to arrive at an amicable settlement. Finally, the employers agreed that where they can secure British plasterers the foreigners employed during the dispute will be dispensed with as their contracts expire, and members of the Association will not be required to work on the same buildings with them. The members, on their part, are not to object to fixing work prepared by the foreigners. The men have yet to endorse the arrangements. We hope both parties will respect the agreement, which is advantageous for the building trades in this country.

ROCHESTER CATHEDRAL.

(See Illustrations.)

WE hope we shall not be accused of irreverence or indifference to history or ecclesiology for saying that Rochester Cathedral has suffered because the story of "Edwin Drood" was not destined to be completed. The reason for our belief is founded on facts which are almost universal. To gain for a building popular esteem something else is required besides architectural beauty. It must have been associated with events which appeal to the emotions. Failing them the building can become almost as interesting on fictitious grounds through the power of the poet or the writer of romances. Mr. RUSKIN, with all his love of truth, was, like an ordinary tourist, fascinated by "ROB ROY'S pillar" in Glasgow Cathedral, and from passages in his books we can see that he preferred to trust to SCOTT'S descriptions of buildings rather than to the impressions which the buildings made on his own mind. Now what Rochester requires is something of that historical or legendary nature which it does not possess. It stands in so admirable a position, and is so near London, the ordinary lover of architecture cannot be satisfied with either the Norman or the Decorated work, and he is no less indisposed to accept its commonplace annals. Happy is the country or district which has no history, for that usually means many generations of men who are able to live in peace. But an existence of that kind does not excite much interest after it has passed away. Suffering has a better chance of remembrance. Much less than a century is sufficient to make people feel no pain at the recital or recollection of the woes of those who suffered calamities, or if we cannot help having sympathy then it becomes a luxury.

Now there is not anything which can be considered sublimely tragic or pathetic in the history of Rochester, and if DICKENS had realised his intention the cathedral would have gained a new interest which would have attracted crowds. The earlier names of the city, Durobrivæ, Roibis, Raribis and Hrof-Ceastre, are evidence of antiquity, and apparently it was of some importance prior to the arrival of the Roman CLAUDIUS. When about seven years after his arrival in Canterbury St. AUGUSTINE, having secured the support of ETHELBERT, resolved to establish two other bishoprics, London and Rochester were selected for the sites as if they represented southern England. The Roman missionary, JUSTUS, was appointed to the episcopal chair placed for him in a new church in the stronghold on the Medway, which was dedicated to St. ANDREW the Apostle, who was the patron of the monastery from whence the missionaries had arrived in England. From some of the property then assigned to the see a revenue is still derived for the support of the cathedral clergy. JUSTUS was not allowed to enjoy a peaceful episcopate, and at length he fled across the channel from his persecutors. The kings of the time were not steadfast in their faith, and in common with the northern tribes they found great difficulty in approving of a doctrine by which they were supposed to agree that their ancestors, whom they reverenced, were justly punished in another world for paganism. In one of the outbreaks against Christianity Rochester and its cathedral were destroyed by the Mercian king ETHELRED in A.D. 676. In the course of the restoration of the existing building about ten years ago, remains were discovered in the foundations which were supposed to have formed part of the first cathedral. As Rochester was attacked in A.D. 839, 885 and 998 by Danish invaders, any building which was erected to take the place of JUSTUS'S cathedral was likely to have suffered, and at the time of the Norman Conquest it was described as falling to pieces.

WILLIAM'S brother ODO, the warrior Bishop of Bayeux, appears to have been placed in command of the castle of Rochester, which the Conqueror had erected or restored. For the bishop's office ERNOST, one of the monks of the famous abbey of Bec, was selected by LANFRANC; but as he lived in Rochester for only a few months he was unable to exhibit his power. He was succeeded by GUNDULPH, whose name will always be connected with the cathedral. He possessed that instinct for building which characterised so many of the Mediæval clergy, and there was scope enough for its exercise at Rochester. As was said by LAMBARDE, he "never rested building and begging, tricking and garnishing till he had advaunced this his creature to the just wealth, beautie, and estimation of a right Popish Priorie." Apparently he commenced with the tower, but for what purpose cannot be determined. The history of the cathedral during four centuries suggested there was a need to supplement the strength of the walls with a defensive structure, and GUNDULPH, who was employed at the Tower of London, may be supposed to have a knowledge of military engineering which he would wish to exercise for the security of his own church. There is another theory, according to which the tower was a campanile; but as it was never much more than 60 feet in height it could not be very serviceable in that capacity, for the sounds would not travel far. That it was used as a belfry does not imply there was no other reason for its construction. The lower part of GUNDULPH'S tower has survived, and is preserved as a relic, but it does not increase the picturesqueness of the cathedral.

The value of the relic is enhanced because it is uncertain how much of the cathedral can be ascribed to the bishop. The Norman bays of the nave up to the choir arch were probably carried out by him on the south side, but whether he completed those on the opposite side is doubful. While the Norman style prevailed alterations took place, and it is supposed that a part of GUNDULPH'S work was superseded by masonry arranged in a somewhat different form. The Norman triforium, for instance, is considered to belong to the later period, and as much of the west front as is Norman and which is generally accepted as the most interesting part of the exterior, cannot be credited to GUNDULPH. Bishop ERNULF, who was consecrated in 1115, and his successor JOHN, were also lovers of building, and it is supposed they endeavoured by casing and other means to transform the severity of the work of the first Norman bishop. The cathedral was consecrated in 1130, when HENRY I. attended, but during the ceremony a fire took place in the city to which many of the wooden buildings succumbed, and the cathedral did not altogether escape. During the twelfth century there were other fires, and one of the consequences is the extreme difficulty of discovering when several parts of the Norman building were erected.

The need of enhancing architecture by interest of another kind was more felt in an earlier period. Although Rochester Cathedral was almost the oldest in England, and was associated with St. JUSTUS, St. PAULINUS and St. YTAMAR, who were among the bishops, yet it was without a martyr, and was therefore in a manner inferior to the mother church of Canterbury. In 1201 a Scottish baker named WILLIAM, who belonged to Perth, had vowed to make a pilgrimage to Palestine, and arrived in Rochester. He worked at his calling while on his journey, and made it a rule to give one in ten of his loaves to the poor. From Rochester he intended to proceed to Canterbury, but he was murdered on the way by his servant. His body was brought back to the cathedral and obtained the reverence usually given to a martyr. Out of the offerings made at the tomb enough money was obtained to pay for rebuilding the choir. The work was accomplished under the direction of WILLIAM DE HOO, the sacrist, who may have been the English WILLIAM, the renowned successor of WILLIAM of Sens at Canterbury. In the course of the thirteenth century WILLIAM of Perth was canonised, and his memory deserved all the honour which the clergy could bestow, for at the time when his remains arrived the cathedral treasury was empty. The reverence for him was not confined to the poor, for it is recorded that EDWARD I. on a visit to Rochester offered fourteen shillings at the shrine.

From time to time additions and alterations were carried out in the cathedral. The usual rule of introducing the style of the moment was not always adopted, for it is believed that builders as late as the Decorated period imitated the Norman work of the triforium. In 1343 the central tower was raised, but it is needless to say it is not the structure now seen, which cannot be said to possess the qualities of fourteenth-century Gothic. For the existing tower Mr. COTTINGHAM was responsible. During the Perpendicular period there was a revival of interest in the building. JOHN ALCOCK, who reigned from 1472 to 1500, was the last of the building bishops, and during his

piscopate the west window and other works were constructed. The lady chapel, which adjoins the nave and the outh transept, was another work of the time. The years hich followed were not eventful, and the bishopric declined, possible, in importance. It is now difficult to understand hy JOHN FISHER, who was chancellor of Cambridge, ıould be considered as receiving promotion when he was ıade bishop. He was executed by HENRY VIII. in 1535, nd subsequently a new order of things was introduced.

It was the king's desire to apply the revenues of the athedral mainly towards educational purposes. But it annot be alleged that the conservation of the cathedral was eglected. About a century after the change it was reported Archbishop LAUD that the building suffered from the bsence of glass in the windows, but the explanation offered y the Dean and Chapter was that extraordinary expenses ad to be met, and that the windows were left unprotected hile other works were in progress. About the same time military officer described the cathedral as "very lightsome nd pleasant." The Parliamentary troops did not commit as ıuch vandalism in Rochester as in other places, and confined ıeir acts to the altar and its surroundings. But a great ıurch may superficially appear in excellent condition hile dangers to its stability are increasing. It was reorted in 1662 that although a sum of 8,000*l.* was exended by the Dean and Chapter of the cathedral, at least 000*l.* in addition would be required to complete the paration.

In 1679 the fall of the steeple was declared to be ıminent, and the estimated cost of the required works as said to be 1,000*l.*, but by a smaller outlay the timber ructure was made to endure until 1749. The cathedral ıs a heavy responsibility to the authorities. HASTED, the storian, writing in 1782, was of opinion that "in all kelihood the care and attention of the present Chapter ll not be sufficient to prevent the fall of it even in their ne." During the present century it was necessary to pend large sums on reparations. Although COTTINGHAM, COTT and PEARSON have accomplished much, there are any opportunities remaining for those who are lovers of verential restoration.

CHARLES SIMART.

[BY A CORRESPONDENT.]

T is often said that if an artist will scorn to produce works which are not above the ordinary level of the ırket, and will endeavour to rival the great masters of tiquity or of the Renaissance, he is sure of renown. The e of CHARLES SIMART, the French sculptor, is a comentary on that theory. Only about forty years have passed since his death, and yet his sacrifices for the sake the highest class of art are now remembered by no ore than a few sympathisers. His career is never referred as an example of lofty aims, and as far as fame goes he ght have been one of the artists who divided their oughts between commerce and art, and of the two prered the former. Yet no man of his time was more pired with the forlorn hope of elevating art than CHARLES IART, and for the greater part of his life he suffered ough faith in his ideal. The antique sculptors devoted mselves to lofty subjects, and SIMART also would not ndescend to treat anything of slight importance. As a ult, what he produced was generally above the intelliıce of the public. SIMART was therefore deprived of the rons on whom artists depend. He accepted his fate, l not until the close of his life did he utter the sad clamation that "sculpture was a horrible trade." Yet the n who endured so many privations for the sake of art onged to a class who might be supposed to aim at wealth ove all things.

CHARLES SIMART was born in Troyes in 1807. His ıer was a joiner, and it was intended that he was to ow no higher occupation. In those warlike days France s not indifferent to technical education, and the boy was tructed in practical geometry and line drawing. But the ıng SIMART found more delight in less formal work. e drew the figure and copied ornamental forms. Antique fascinated him, and with such tools as he found in his father's workshop he carved a copy of a bust of the NIOBE when he was only fifteen. In French towns there are always men who are on the look-out for indications of artistic power. Troyes was not an exception. SIMART was considered to be likely to add to its reputation, and arrangements were made to enable him to study sculpture in Paris, and a sum was guaranteed that would be sufficient to pay his fees in one of the ateliers. The expenses of maintenance and lodging he was expected to provide by employment of some sort in Paris.

In common with the majority of students in similar circumstances, SIMART suffered during his first period in the city. But such trials are not without advantage, for they are tests whether a youth's enthusiasm is sincere. DUPATY the sculptor took pity on SIMART and obtained for him some humble commissions, and, among others, one of the numerous busts of CHARLES X. which had to be produced in 1826 for official purposes. He was too poor to employ a carver, and SIMART was therefore obliged to operate on the marble as well as to model. His ability was recognised, and PRADIER, who was supposed to be inspired with the antique spirit, not only employed him, but brought SIMART as a companion to Rome. He studied as well as worked as a sculptor in the ancient capital, and on his return to Paris in 1833 he competed for the Prix de Rome and was successful.

SIMART went back to Rome under new conditions. He possessed the skill of a practician as well as the ardour of a student. He was able therefore to utilise to the utmost the resources which Rome possesses. His theory was that by an impartial combination of the study of life and the study of the antique he would be able to advance towards the goal which was sought after by the greatest sculptors in all ages. He was by nature an idealist, but that did not make him indifferent to living forms. SIMART'S eclecticism was exemplified by the *Disc-thrower* and the *Orestes*, which under the conditions of his prize he was bound to send to Paris. The latter was purchased by the Government in order to be kept in Rome to serve as an incentive to future prizemen. It will be said that the majority of sculptors adopted principles corresponding with those of SIMART, for who can nowadays be an unmitigated idealist or realist? Everyone must compromise, and the result will correspond with personal idiosyncrasy. The proportions of realism and idealism are not to be determined as if they were chemical quantities, and a sculptor's most characteristic work is that in which he adopts the quantities that are satisfactory to himself. SIMART leaned to idealism, and there was a seriousness about his figures which made people believe that he preferred the severe, and looked upon himself as a follower of the earlier schools of Greece. But it could not be said that his works were chilling or inanimate. The subjects of the public commissions assigned to him were, however, sufficient to raise a prejudice against SIMART. For the Senate he produced figures of *Philosophy* and *Poetry*, and it would be difficult without becoming exaggerated for either to assume the animation which the people of Paris admire. RUDE'S *Chant du Départ* and the *Danse* of CARPEAUX are examples of the classicism which have perennial interest in the capital. SIMART could not imagine *Justice*, *Agriculture*, *Industry*, *Commerce* presenting such an appearance of active force. Repose with him was an indispensable quality of sculpture, and the subjects offered to him for treatment required it as essential.

SIMART was as much an admirer of INGRES, the painter, as any of his pupils. The sculpturesque figures of that artist appealed to him more strongly from the canvas than if they were modelled in clay. In return INGRES used all influence to aid the sculptor. He obtained for him the support of the DUC DE LUYNES. One of the large rooms in the Château de Dampierre was adorned with wall paintings by INGRES, and SIMART, on his recommendation, executed a frieze. The subjects he selected were the various ages of which the world was supposed to have had experience—gold, iron, &c. SIMART'S success induced the DUC DE LUYNES to give him a commission for a reproduction of the *Athené* of the Parthenon, which was one of the great works of PHIDIAS. The description of PAUSANIAS was followed, and therefore several materials were employed. The face was of ivory, with eyes of azurite, a blue mineral containing much copper. Around the neck was a collar

of green amazonite ; the breast was covered with a gorget of gilt copper, with serpents and a medusa of ivory ; the tunic was of silver, to which a green tone was imparted ; the feet were of ivory, with sandals higher than those employed on the Greek stage. The arms were of ivory, but the material was there more suggestive of heaviness than of strength. On the head was a colossal helmet. The appearance of the figure was a surprise, but it was judged as if it were an *objet de Paris*, which was to be placed on a table in a salon. SIMART had endeavoured to represent a being that was a spirit rather than a woman, and critics were disappointed because the statue did not correspond with one of the ivory figurines to be seen on the boulevards, and the head was not as attractive as one cut from meerschaum for a pipe-bowl.

Another work for which SIMART was selected consisted of the reliefs which surround the sarcophagus of NAPOLEON in the Invalides. The subjects were serious, and in any place could not well be treated in a lightsome mood, but in a mortuary chamber there was an additional cause for realising their full importance. That SIMART's reliefs impress most visitors is a tribute to his skill, but we are afraid the true cause of the effect produced is not always admitted. The sculptor's name is now rarely mentioned, nor is his example cited as a pattern for his young countrymen, although he was prepared to endure much for the sake of his art. The recollection of his fate is not encouraging, and it would be well if critics would more often realise that the failure in more than one sense of CHARLES SIMART forms a commentary on the sublime doctrines which are announced for the guidance of artists, who are expected to make sacrifices such as are not imposed on any other class of men.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute was held on Monday evening last at Conduit Street, W., Professor Aitchison, R.A., president, in the chair.

The President moved the temporary suspension of by-laws 3 and 7, so as to allow of the nomination of the Royal Gold Medallist elect, Mr. George F. Bodley, A.R.A., as a Fellow. The motion for suspension was carried by acclamation.

The Secretary announced the decease of Mr. Charles Bell, who was elected Associate in 1870 and Fellow in 1880.

A letter was read from Lord Reay, who had been invited to the meeting, in which he expressed regret for not attending, as he was going abroad. In commenting on the paper to be read, Lord Reay said :—"Mr. Bailey's paper is of great interest to architects and educationists, and deserves to be widely read and translated in foreign languages, as it is sure to attract the attention of foreign educationists. Mr. Bailey speaks with authority. The building operations of the London School Board are on such a large scale, the problems which have to be solved are so varied, they have been so carefully considered by a number of experts, that Mr. Bailey's admirable review of this branch of the School Board work cannot fail to meet with the full recognition due to the care with which it has been written."

Mr. T. J. Bailey, architect to the School Board for London, read a paper on

The Planning and Construction of Board Schools.

Dealing first with the public elementary school, the author dwelt upon the need for careful selection of the site. An ideal site would be one of about two acres, rectangular, with the longest side as a street frontage and having a western aspect streetwards. There should be proper provision of light and air, immunity from noise of traffic for classrooms, an open playground space of at least 30 superficial feet for each child, and of such a shape as to be available for games such as foot-ball for the boys, tennis, &c., for the girls. In London and crowded districts where the ideal 30-feet minimum cannot be realised, the playground question is usually best solved by providing on the ground-level for boys and infants, and putting a flat over the whole top of the building to form a playground for the girls ; where sufficiently large, playgrounds should have a covered space, 50 or 60 feet by 18, with sides enclosed, open in front to the sun. Various desirable accessories to playgrounds, the most suitable paving, walls and railings, gates, the school-keeper's lodge, &c., were duly detailed by the author.

Next treating of the buildings, the author described the three-storey school as being the most usual type. The infants are on the ground floor, the girls on the first floor, the boys above. The maximum size or accommodation of a group should not exceed 1,548—in departments of boys 516, girls 516, infants 516—and if further accommodation is required, it should be provided by a separate mixed department. The hall, considered by the Board indispensable to every department, is a very good size at 54 feet by 30 feet ; the classrooms, ten in number to each department, graduate from sixty to forty in accommodation. If possible, the main line of classrooms should face the playgrounds rather than a noisy road, and draw their light from the east, as that aspect suns up the rooms in the early morning and does not disturb them for the day. The hall, facing west, provides a good reservoir of sun-lighted air to help the classrooms, and is a cheerful place to march the classes into for recreative or collective purposes. Architecturally this elevation, being the more broken up (comprising the main lighting of the hall, the staircases, cloak and teachers' room and blocks and gable ends of wings), is more desirable for a street front than the long unbroken line of classrooms. Two staircases for each senior department are required, and two entrances for the infants on the ground floor. The author then described in detail the plan of the building, the dimensions of the various rooms and staircases, the fittest materials for facing walls and for floors and staircases, the requisite fittings and the lavatory and sanitary arrangements.

Touching warming and ventilation, the author glanced at the efforts towards improvement in these matters during the last twenty years. He commended as very good the system of low-pressure hot-water pipes round the walls and just above the floor where the desks are placed, and a few ventilating radiators bringing in warm fresh air ; but even with this system an open fire in the room is needed, the brick flue simply connecting with the outer air not being sufficient for extraction. The author had tried trunks from the ceiling-line of each room gathered into groups with a single outlet equal to the combined area of the group, and with a coil of hot pipes in the same to produce an upcast. This was effectual as far as ventilation was concerned, but could not be recommended for schools of more than one storey in height ; in three-storey buildings it had the effect of conveying the sound from the rooms below to those above and disturbing the classes. The greatest care should be taken to get continued purity of air and with as little trouble as possible. The system known as the "Plenum" effected this in the only satisfactory way; it introduced fresh filtered air above the heads of the occupants of the room, warm in winter and cool in summer, diffused it over the area and extracted it at the floor-level on the same side as the inlet, carrying away with it all the unpleasant odours of damp and evil-smelling garments. This system has the further advantage that where closed and even double windows are necessary to exclude noise there is always a quiet side from which the supply of air can be drawn, and the closed and double windows improve the working. The cost is not appreciably more than an ordinary hot-water installation, but the builder's work involved in the formation of ducts, flues, &c., is a rather costly item.

In a section on furniture and fittings the author dealt with the pattern of desks and their arrangement in the various departments, the lighting, the seating accommodation, platforms, cupboards, and the adjuncts found essential for educational and recreative purposes. Interesting reference was made to an order issued by the Board to each of their schools requiring a plan of the departments to be prepared by the scholars under direction of the teacher, measured and drawn to a scale of 4 feet to the inch, the furniture delineated and the walls coloured in, and submitted to the architect for approval before being framed and hung up in the school. Some two or three hundred of these plans had been submitted to the author, and he had been much surprised and pleased at the high quality of the work. Few had been returned for revision, and some would have been no discredit to an architect's office.

The higher-grade schools, of which there are forty-four in operation under the London School Board, are equipped with rooms for science teaching in addition to those for art and manual work. They comprise chemical and physical laboratories, with balance-room and small dark-room for experiments in photography, and a store for chemicals, also a demonstration and lecture-room. The buildings, fittings and general arrangements of the Cassland Road school, Hackney, a typical example of the higher-grade school, were shown in a series of detail drawings exhibited by the lecturer.

A third division of the paper was devoted to buildings for special instruction, comprising centres for domestic economy (cookery, laundry-work and housewifery), manual training in wood, manual training in metalwork, swimming. The combination of subjects in the domestic economy curriculum has led to the requirement of a building in each case capable of giving proper facilities for the teaching. A typical building planned after consultation with the committee in charge of these subjects and the lady superintendent, consisted of a class-room on the ground-floor 22 feet by 18 feet, seated for 40 girls, a kitchen, sitting-room, scullery and bedroom, with entrance-lobby and staircase leading to the laundry and cookery class-rooms on the upper floor, the object being to provide instruction in general housework, as well as cookery and laundry work.

)etails were given of the requirements of the manual training entres for wood and metalwork. With the sanction of the :ducation Department the Board have decided to establish ıree swimming-baths in connection with the schools at Marlorough Street, Southwark; Hugh Myddelton, Finsbury; and yham Road, Brixton. Particulars were given of the proposed ath at Lyham Road. The building will be separate from the :hool and have a distinct and separate entrance, with superıtendent's office, &c. The swimming-pool will be 50 feet by ɔ feet, 2 feet 9 inches deep at one end and 5 feet 6 inches at ıe other, lined with white glazed bricks, and having dressing-oxes, spray-baths, w.c.'s, &c., and washing and drying-room ɔr towels and bathing dresses. The water will be warmed by ıe injection of steam round the sides close to the bottom of ıe bath, the pipes being in chases and cased for protection.

The mixing of children mentally weak with those of normal ıtellect being productive of undesirable effects on both, it has een found necessary to provide accommodation for these in ɔecially planned buildings. There are thirty-nine centres in ctual work in London, with 1,597 children on the rolls October 31, 1898), and about thirty-five more are either in ourse of building or immediately contemplated. The unit for assroom is less than that for the ordinary school, more indiidual attention being required. The classrooms are all on the round floor, are 20 feet square and seated for twenty children. hall corridor about 20 feet wide, well warmed and ıade as cheerful as possible, is provided for exercise, rill, &c. A good lavatory and baths are provided; boys ıd girls are frequently taught in mixed classes, but ave separate playgrounds and offices. Schools for the deaf 're also provided on the centre system, and are much on the ame plan as those for the mentally defective. The classrooms 're smaller, 18 feet square, and seated for ten. Seats should ɔ arranged in a circle, and the rooms should have a strong gh or top light so that the lips of the children can be watched ıd studied, they being taught to read what is said by the lip ovement. The Board have seventeen centres in operation, th 513 children on the rolls (October 31, 1898), and seven in urse of provision. Particulars were given by the author of a heme for the establishment by the School Board of a home r the boarding and instruction of deaf children who had to be ught on the sign system. The schools will be built on the ttage home principle, the number in each home not to ceed ten, and the training will be largely agricultural or rticultural. In most divisions of the London district school acmmodation has to be provided for a few blind children. These mber about 150, distributed over eight centres, and it is genery sufficient to provide two small classrooms at each centre th separate entrances, cloak-rooms and lavatories, the classes ing mixed. Separate play-yards and closets are necessary.

Under the head of "Buildings for the Training of Teachers," e author described a scheme of buildings for this purpose ıich might be considered as very complete, and as embodying that is likely to be required in the future. On the ground or are provided four classrooms for forty-two and thirty-six, o of each seated with single desks; a central hall, 50 feet nches by 33 feet 6 inches, with staircases, &c., at each end; the first floor are four classrooms, and a properly equipped mnasium over the hall; on the upper floor an art room over e gymnasium, the remainder of the floor being devoted to emical and physical laboratories, lecture-room, balance and rk-rooms. A basement is provided for the engineering appa.us, and also a kitchen for the preparation of luncheons. ıe site of the particular buildings dealt with was large ɔugh to give space for lawn tennis on the girls' side, and for tball on the boys'.

The buildings for industrial and truant schools, which next ne under consideration, must be of an essentially different ıracter from other buildings of the Board, as they are ırding establishments. Descriptions were given of a buildrecently erected for this purpose in connection with the *ɪftesbury* training ship and also of the Upton House ant school, the only building as yet erected specially the purpose. The Board are negotiating for a large of some 15 acres in the neighbourhood of London for the pose of erecting two establishments—an industrial school about 120 boys and a truant school for a like number. e two institutions will be entirely separate as far as their upation and management are concerned, but will probably under the control of one superintendent and body of nagers. Details of the proposed plan and general arrangents of the buildings were given by the author.

For the purposes of the administrative work of the Board ndon is divided into eleven divisions, necessitating a corre-ɔnding number of office buildings. The offices for the East mbeth Division, now erecting in the Peckham Road, were ɔcted for description as a typical block. On the ground ɔr is the entrance hall, a large room 57 feet by 22 feet for the itors to perform their clerical work, a room for the assistant ɔerintendent, and an office for the check clerk, also the atories, w.c.'s, &c.; on the first floor a committee-room, used also by the superintendent, and a clerks' office; on the second floor the correspondents' and clerks' offices, and caretaker above.

In a few general remarks, with which the paper closed, the subject of cost was dealt with. The Princess May school, Kingsland, was cited as a typical case, and as tenders were received only so lately as March of the present year, it may be considered as up to date. The building is to be of three storeys, to accommodate 1,548 children, on a site of about 1¼ acre. The cost per head is estimated to be 13*l.* 18*s.* 4*d.* This includes building the whole of the brickwork in cement, also the provision of glazed bricks to staircases, corridors and dadoes of classrooms and halls, but does not include furniture. The cost of enclosing the whole site with walls and railings, tar-paving, drainage, and provision for deep foundations below a normal depth of 6 feet is about 5,000*l.* more. The total cost will be some 750*l.* within the limit allowed by the Education Department. There was a suggestion a few years back that unnecessary expenditure was incurred on architectural adornment, and the committee dealing with this branch of the work ordered two or three schools to be built of stock bricks and slate roofs, with no architectural features about them. It was found, however, that the difference of cost between bare utilitarianism and buildings designed in some sort of style and regard for materials and colour was rather less than 5 per cent.

The Hon. Lyulph Stanley remarked that the building of public elementary schools could not be approached from a purely architectural knowledge of construction. The architect in such work had always to adopt the policy of the managers of any such scheme, and the exigencies of his work would follow the requirements of his employers. Mr. Bailey in his paper had indicated the requirements of school buildings and had suggested certain things in the planning of them, but no definite rule could be given. Many of the educational points had to be carried by force by the London School Board before the Education Department, who often raised objections to the details of a plan.

Mr. C. J. Dawson, headmaster of the Aldenham Street Board School, said the requirements of the accommodation should be framed by the possibilities of a teacher's powers. The combined question of ventilation and warming should receive attention, as in many schools the system of ventilation did not answer, and the mere opening of windows had risks for both the teachers and children.

A vote of thanks to Mr. Bailey, proposed by Mr. E. W. Mountford, was seconded by Mr. R. Phenè Spiers.

The meeting then terminated.

THE ARCHITECTURAL ASSOCIATION.

THE annual dinner of the Association was held at the Holborn Restaurant on Wednesday evening last, the president (Mr. G. H. Fellowes-Prynne) in the chair.

The company numbered over eighty guests, and among those present were:—The Archdeacon of London, Sir Edward Clarke, Q.C., M.P., Canon A. S. Porter, Rev. R. M. Blakiston, Sir H. H. Howorth, M.P., Mr. Aston Webb, A.R.A., Alderman Hind, Dr. G. V. Poore, Messrs. Reginald Blomfield, J. C. Preston, W. E. Riley, H. H. Staham, T. Blashill, W. White, H. Fellowes-Prynne, E. Swinfen Harris, H. Hall, A. W. Johnston, H. Hale, E. A. Fellowes-Prynne, C. Kelway, R. H. Weymouth, C. H. Strange, A. Bolton, A. Dickson, H. L. Florence, F. W. Macey, E. T. Hall, H. T. Hare, G. M. Nicholson, R. S. Balfour, T. Holderness, H. W. Pratt, F. R. Taylor, E. A. Mutter, Beresford Pite, W. H. Seth-Smith, Cole A. Adams, John Slater, Rev. James Beeby, Messrs. B. F. Fletcher, J. Murray.

The usual loyal toast having been honoured, the President proposed "The Church and Houses of Parliament."

The President said he offered an excuse for putting the Church first, because it was always closely allied to architecture. At the present time there was no more difficult toast to propose than the Church, because the subject was full of pitfalls to the uninitiated layman. The Church's influence on their noble art was incalculable, and the art has had an influence on the Church. With reference to St. Paul's Cathedral all who were connected with their art had an interest in the decoration. There was, however, a critical part. St. Paul's was a national monument, designed by one of the greatest of their artists, and architects felt they had a right to speak on the subject of its decoration. Professional advice in the matter seemed to have been ignored, and with the work of such a national character it was necessary that the architecture should be kept intact. The legislature did not seem to encourage architecture, although it was by the art that the history of the country was written preserved in stone.

The Archdeacon of London, who responded, said the modern churches of London were not as satisfactory as earlier examples. They seemed poor in fabric, and there was often great

need for better ventilation. With regard to the decoration of St. Paul's the intention was well meant on the part of the Dean, who had been recommended to take the expert advice of Sir William Richmond. The work he had introduced was extremely beautiful in its way, but the criticism it had called forth showed such professional disapproval that the committee for the decoration had reconsidered their scheme, and when the work was resumed the result would be satisfactory.

Sir Henry Howorth, responding, said architects might think they were badly treated by the Legislature and that Parliament did not do its duty to their art, but in reality the freedom that was allowed to architecture encouraged variety and gave great opportunities to the members of such a profession.

The other toasts which followed were "The Royal Academy" and "The Royal Institute of British Architects," proposed by Mr. H. H. Statham, and responded to by Mr. Aston Webb, A.R.A., and Mr. H. L. Florence; "The Architectural Association," proposed by Sir Edward Clarke, Q.C., M.P., and responded to by the President; "The Guests," "The Lecturers and Instructors," "The Committee and Officers," and "The President Elect."

Songs during the evening were sung by Messrs. S. Constanduros, H. Passmore, F. D. Clapham and G. B. Carvill; Mr. Leonard Butler at the piano.

ST. THOMAS'S CHURCH, NEWPORT, ISLE OF WIGHT.

A MEETING was lately held in Newport, Isle of Wight, to make arrangements for the restoration of St. Thomas's Church. The following report by Mr. John B. Colson (Colson, Farrer & Nisbett), architect and surveyor to the Dean and Chapter of Winchester, was read at the meeting :—

Agreeably to your instructions I have made a careful survey of the fabric of your church, and will now report to you as briefly as practicable the result of my observations. The object in view in asking me to make this examination is, I understand, more especially to obtain an opinion in respect of the decay which has occurred to the masonry forming the decorative features of the exterior of the building, and I propose, therefore, to strictly confine myself to this subject, and to report to you upon what, in my opinion, is desirable to be done for its proper restoration and permanent sustentation.

Generally, I may say, as regards the building, the walls of the main fabric appear to be in a solid and substantial state, and from this it may be inferred that the foundations are sound. The stone ashlar of the outward wall surface, formed principally of stone from Quarr Abbey and Binstead, or of local freestone, is in a good condition, and with the mortar jointing or pointing appears to be thoroughly hard, to be quite suitable to its situation and able to withstand the various atmospheric influences to which it is exposed.

The decay, which is the principal subject of this my report, is wholly confined to the lighter and more salient portions of the structure, such as the pinnacles, parapets, string-courses, mouldings and the like, some of which are in an advanced stage of dilapidation, which must not be overlooked, lest the detail features of decoration become obliterated, and possibly worse effects follow to the main walls themselves. Moreover, there is an evil contingent upon this decayed condition of the stone in the constant falling of it upon the roofs, whereby damage accrues to the slates and gutters become choked, to say nothing of the danger to the public by the falling of broken fragments into the adjacent street.

As regards the walls, mere surface defects, when the heart of the work is sound, are of comparatively little importance, provided only that the joints are made secure against the penetration of water; but when parapets, pinnacles, weathering, string-courses and other light portions become really defective, a source of danger is created that cannot prudently be overlooked. My statement will show, and it is apparent to any casual observer, that the condition of your church in this respect is indeed deplorable, especially taking into consideration the fact that the building is practically of modern construction.

Erected in 1854, the tower being completed a few years later, therefore not half a century old, the decay cannot be accounted for by age and exposure, and there can be no hesitation in my saying that the fault is through the injudicious selection of the material used.

The stone of which the defective parts are constructed is known as "Caen" stone, is a limestone, and is obtained from the great oolitic formation in Normandy, and has been imported into England from a very early period, its first appearance being about 1300. [The vicar interpolated the remark that he had had an opportunity of seeing the original agreement for the building of the church, and apparently Caen, as well as Swanage and Binstead stone, was included as well.] There was a cessation of its use after 1448, when Normandy was lost to this country, and it was not until the early part of the present century that its employment here was resumed.

Being of pleasing colour and of a texture easy to work, yet capable of great resistance to crushing weights, it became the fashionable stone of the period, and was largely used about the middle of the present century by eminent architects and builders, and it is not casting the slightest reflection upon the judgment of those who advocated its use in stating that it has not fulfilled its expectations, and that here, as elsewhere, it has proved itself not able to resist the dissolving power of moisture charged with the sulphuric and carbonic acids peculiar to our town atmospheres, and in this particular instance aggravated also by the presence of salt.

I will now proceed to describe the condition of the several portions of the church in the same order as I noted them upon the occasion of my survey, viz. :—

North Clerestories of Nave.—The clerestory windows being in a somewhat sheltered position, are in a fair condition, the stone having acquired a good weather surface and is little decayed. Slight fractures have occurred in the tracery arches, but are of no particular importance.

South Front of South Aisles, with the Porch.—The copings, parapets, cornices, string-course under windows, upper plinth moulding, gables and weatherings of buttresses are all in a more or less decayed condition, the apex stones and the lower weatherings of the buttresses being considerably fretted away, the panelled parapet being in the same state, the detail of ornamentation being in some instances entirely lost. The string-course under the windows and the upper plinth moulding are at first sight not in such a bad state, but upon close examination the mouldings are found to be much eroded on the under side, and on the exposed position are entirely eaten away. The window-sills are especially bad and the decay is equally apparent upon the inside. The traceries and the mullions of the windows and the porch doorway being protected by the projections above are in a fair condition, and the jamb stones are only here and there decayed, but the hood or lable stones, together with the carved corbels, are much disintegrated and losing their detail. The lower plinth weathering is of a harder stone, viz. Portland, and is in good condition.

North Front of North Aisle, with the Porch.—The remarks made above upon the south front entirely apply to the north aisle, but, if anything, the buttress gables may be described as being in a slightly inferior state.

Eastern End of Chancel, Nave and Aisles, and Chancel Aisles.—The pinnacles, gable coping, parapets, buttress gables and weathering, and the string-courses are all in a much disorganised state, the pinnacles and more exposed portions being especially bad; in fact, one chancel pinnacle is entirely gone and the other partially so; the crosses on the gables are also lost, as well as much of the copings, parapets and mouldings. The tracery and mullions of the windows here, as in the nave aisles, are not so bad, but the jamb mouldings, labels and sills are, upon close examination, found to be in places much destroyed. The Portland stone lower plinth weathering is intact.

The Western End of the North and South Aisles of Nave.—The remarks made upon the eastern front apply equally in these cases, the pinnacles and copings being especially bad.

The Tower.—With the exception of the spire of the turret, which has apparently recently undergone repair, all the stonework of the pinnacles, the parapets, string-courses, buttress gables and weatherings are in a sadly decayed and disorganised state. The pinnacles and parapets, being of great elevation, and consequently much exposed, are seriously defective. One pinnacle may be described as being in a dangerous state, being eroded to the core, and is temporarily propped up with a piece of wood, while all are supported by iron stays attached to the tower roof. The elaborate detail of this portion is becoming entirely lost, and unless receiving prompt attention will become a complete ruin.

The stonework of the belfry windows is in a comparatively better state, as is also that of the lower string-course and mouldings, but on the exposed portions there are signs of much decay, and there is almost everywhere evidence that the process of deterioration is being rapidly proceeded with. The western entrance, which is of good design and of somewhat elaborate detail, being in a sheltered position, is fortunately in a better condition, and the defects that have occurred are of minor importance.

It will be learnt, I think, from the detailed description already given that although there is nothing seriously defective in the structural stability of the fabric, yet that a large extent of repairs more or less costly is required to make good dilapidations and to put the building in a satisfactory condition. I know full well how distressing it is to the eye of taste to have new and modern work substituted for that which is old and venerable, but here such feelings of sentiment need not be taken into consideration, and although I should be the last to advise the removal of a single stone and substitution of new where it is not absolutely necessary, I cannot but feel that it

ecomes my duty to advise the adoption of an extreme course nd to restore in this particular instance faithfully what would otherwise be lost. Any attempt at patching and repairing or he reworking and dressing down of the existing stones would e futile, as in a few years' time the church would present the ame dilapidated appearance as now; besides, the character and etail of the mouldings, which are exceptionally good in conrast to much work executed about the same period, would be ntirely lost and destroyed.

Again, any cutting away of the decayed portions and the ubstitution of new stone of a different quality, at the same ime leaving *in situ* the at present undecayed portions would e entirely unsatisfactory, and the church would be in fifty ears requiring again somewhat the attention that it is proposed o give it now. The brushing away of the fretted portions and he treatment of the stones with some preservative composition ould only be a temporary measure and could not be recomended in any way as an effectual remedy of the existing rouble.

I am therefore constrained to suggest the adoption of a older course, and to advise the entire removal of the Caen tone from all parts of the exterior of the church (excepting, erhaps, the tracery of the windows and the western entrance) nd the substitution in its place of a stone of a more durable uality, worked to the same detail and design as at present.

As regards the stone to be used, the existing walls give essons which may be profitably pondered. The stone used in ne ashlar facing of the exterior of the walls, although much lder, being probably portions of the prior church, shows little r no signs of decay, and proves incontestably that the stones f coarser grit (although perhaps from local quarries) are far ore durable than the fine-grained limestone which has until ecently largely been used throughout the country.

The very coarse-grained stones of Quarr Abbey and instead are, of course, unsuitable for the fine detail of decorave work, and I should prefer the use of the best beds of the hilmark quarries in Wiltshire. This stone is of a siliciferous ature, gives excellent weathering qualities, while the soft and en grain renders it capable of being elaborately worked, and is well adapted for buildings near the sea.

It is impossible at this stage to state accurately what the ctual cost will be, but it may be sufficient for present purposes o say that the probable cost of a complete restoration such as have suggested would not be less than 3,000*l.* In underking a work of this kind it would not be necessary or dvisable to embark on the whole at one time. One façade ould be treated at a time; for instance, the south of the outh aisle, of which I was enabled to make a somewhat etailed estimate, could be completed and finished at a cost of o*l.* before another portion was commenced, and so on from me to time until, as funds permitted, a section of the whole ould be taken in hand and completed.

The north façade would probably be about the same cost. hat to the tower being in the worst condition should, however, eceive first attention. The pinnacles would have to be entirely built, and advantage should be taken of the occasion to rengthen the bases, which could be done without difficulty, s the walls below are wide enough to provide the requisite earing.

The cost of the restoration of the whole of the tower stonework may probably amount to 1,000*l.*, and a similar amount ay be expended upon the eastern portion of the church.

A slight settlement of the tower is observable, probably sulting from the increased weight of that portion of the ructure on footings resting on a bed of the treacherous subil known as "blue slipper." This settlement has caused a ight fracture throughout the arches of the nave and clerestory indows immediately adjacent, and though unimportant at esent, a careful watch should be instituted to ascertain hether the settlement is of a progressive nature so that ecessary steps may be taken in time to prevent further bsidence.

In conclusion, I may perhaps be allowed to remark that in y humble opinion your church, occupying as it does a central osition in your town, having in connection with its erection e associations of Her Majesty the Queen and the late Prince onsort, and being in many respects the most important edifice the kind in the island, is in every way worthy of receiving e attention the foregoing report suggests should be bestowed on it.

THE GREEK STAGE.

A PAPER was read by Professor Percy Gardner at the last meeting of the Hellenic Society on the scenery of the reek stage. He began by stating his opinion that there was t all periods in the Greek theatre a raised stage, and proeeded to consider what kind of a background it had. He ccepted the tradition that the first painted background was iat made for Æschylus by Agatharchus, of Athens, but maintained that this background was not a canvas scene, but a wooden erection painted to resemble the front of a temple or palace. This scene, like the other stage arrangements due to Æschylus, became stereotyped and was not altered according to the requirements of particular plays. Those requirements were met partly by the use of periacti, three-sided prisms which turned on a pivot and presented to the audience different paintings which conventionally represented different localities, partly by the use of stage properties, curtains and the like. But in all periods stage scenery was very simple and not realistic. These views were enforced by an examination of the statements of Vitruvius and Julius Pollux, and in particular by setting forth the testimony offered by inscriptions from Delos, which prove that the painting of the front of the stage building was permanent and paid for, not out of the costs of producing plays, but out of the cost of construction.

THE SURVEYORS' INSTITUTION.

THE annual meeting of the members of the Surveyors' Institution was held at the Institute, Great George Street, on Monday, Mr. Robert Vigers, the president, in the chair.

The report stated that the total number of members in May 1899 was 2,993, as against 2,836 in the previous year. The balance-sheet showed that there had been an increase in subscriptions of about 170*l.* on the year. The total revenue for the year had been 8,177*l.* On the expenditure side the total payments out of revenue (current expenses) had been 6,094*l.*; on account of building contract 13,100*l.*, and after paying other expenses there was a balance in hand of 630*l.* 17*s.* 4*d.* The total investments amounted to upwards of 21,000*l.* The percentage of successful candidates, taking all the divisions together, had been 63·44 per cent., as compared with 63·77 per cent. last year. The "Institution" prize of 15 guineas was gained by a candidate in the building sub-division, who obtained 850 marks out of a possible 1,000. The special prize of the value of 10 guineas was awarded to a candidate in the building sub-division, who obtained 788 marks out of 1,000. The Crawter Prize for the best work on valuations was awarded to a candidate in the land agency sub-division. The Penfold Gold Medal was awarded to the candidate who obtained the highest marks in Division IV., with 855 out of a maximum of 1050. The "Penfold" Gold Medal was gained by a building candidate in Division III., who also won the "Driver" Prize of the value of 15*l.*, with a total of 1,044 out of 1,200 possible marks. The Preliminary Prize was awarded to the candidate heading the list in the preliminary examination with an aggregate of 492 out of 500 marks. The "Daniel Watney" Forestry Prize had again been withheld this year, there being no candidate whose work showed sufficient merit to justify its award. The Institution was at last in occupation of its new and permanent home, after many vexatious delays, some of them due to the present disturbed condition of the labour market. The rehousing of the Institution had engaged the anxious and almost unremitting attention of the Council for the last five years. Early in 1894, on the failure of the promoters of the Westminster Improvement Bill to carry out the scheme under which they had agreed to allot to the Institution an advantageous site on the north side of Great George Street, it was referred to the building committee to consider and report on the terms for acquiring a sufficient area of the surrounding property for the extension of the Institution premises on the existing site. It was sufficient to state that as a final result it was decided to acquire three additional houses, viz. 13 Great George Street and 3 and 4 Little George Street, which, with the site of the then existing premises, afforded a building area of 6,700 square feet. For this area the Ecclesiastical Commissioners finally agreed to a ground-rent of 1,000*l.* per annum on a lease for 999 years, in place of the 1,070*l.* which the property was previously yielding, the Institution undertaking to put up a new and substantial building as security for this rent.

On the motion of Mr. Swayne, seconded by Mr. Joseph Starr, the report and balance-sheet were received and approved.

The Chairman, in acknowledging a vote of thanks to himself at the close of his year of office, congratulated the members on their new building, and said the business of the Institution was greatly on the increase.

Mr. T. M. Rickman was appointed the President for the ensuing year.

The Chairman then distributed the prizes. Mr. Gate gained the Institution Prize, Mr. Arthur George Bradshaw the Special Prize of Ten Guineas, Mr. Geo. Freeman the Penfold Silver Medal and the Driver Prize, Mr. Sidney Arthur Smith the Penfold Gold Medal, Mr. Bowden the Crawter Prize and Mr. A. Neate the Students' Prize.

A vote of thanks to the Chairman closed the proceedings.

NOTES AND COMMENTS.

THE objects discovered during last season's exploration of Silchester and which can be seen during next week at the rooms of the Society of Antiquaries, although not all remarkable are at least interesting. The most important is the mosaic pavement, in which local materials were used. It has not the artistic quality of the remains at Bignor, which might have formed part of a palace, but it shows how well the artists could produce effects at an economical rate. The borders are excellent, and probably were derived from Greek patterns. Manufacturers of scagliola will acknowledge the skill shown in the imitations of white and red marbles and porphyry. Brickmakers are now treated as if they were a species of machines, and their early predecessors were likely to have experienced equal injustice. That at least one Roman brickmaker could write is testified by the word "Satis" inscribed on one of the examples, and fancy can therefore picture him as possessed of various intellectual qualities. Prisoners were not unknown in Silchester, for effective handcuffs were discovered, and they form a contrast with the jewellery which may always be calculated on as existing among Roman ruins. The revelation of Silchester itself will have more interest than any articles to be unearthed, but to complete the excavations a further likely sum of 3,000*l.* is needed.

MANY will regret when they learn that the proposal to use a part of the grounds of Wolvesey Castle, Winchester, for an Early English museum as a memorial of the millenary of King ALFRED has excited opposition from distinguished persons, who represent the laity of the diocese of Winchester. An appeal has been addressed to the Ecclesiastical Commissioners asking them to withhold their consent to the alienation of any portion of the grounds. The reasons offered are the following:—(1) At no distant future the entire area of the Wolvesey precincts may probably be needed for ecclesiastical purposes. The trustees of the diocesan Church-house now occupy the greater portion of the Wolvesey grounds, and may need for diocesan purposes the space demanded for the proposed King Alfred Memorial. The privacy and seclusion of the premises would, if so needed, be of paramount importance. (2) In the possible event of the Wolvesey Palace being at a future date required for the episcopal residence, the alienation of a portion of the grounds, which are very limited in extent, would be more than a grave inconvenience. (3) The erection of a hall or museum to contain a non-existent collection of Anglo-Saxon antiquities is in itself an anomaly, and if such collection should be forthcoming, it is in London and not in a small provincial town, however historically famous, that the students and the archæologists would prefer to locate it. (4) To place any such edifice among the venerable walls of Wolvesey is both incongruous and inappropriate. Mr. BOWKER, the honorary secretary of the national committee, in reply, says the actual site for the memorial in Winchester has not been definitely decided on, and no application is at present to be made to the Ecclesiastical Commissioners on the subject. The Ecclesiastical Commissioners have announced that they have no intention of taking any steps for alienating any part of the Wolvesey Palace grounds.

THE United States have found so much profit in bringing art to the aid of the manufacturer, it was not to be expected that the Canadians would remain indifferent to the new policy which must be serious for them, for there is danger of their products being restricted to raw materials which their neighbours can turn to profitable account. The Canadian Manufacturers' Association accordingly issued a manifesto a few weeks back in which attention is called to one of the deficiencies of the educational system. An extract will suggest the spirit of the document:—"Whereas, fully appreciating the merits of all that may be said relative to the necessity of technical schools being established by those in authority, to whom attaches the responsibility for the life and growth of our commercial enterprises, it is expedient to direct attention to the teaching of art and design which is an important part of the education which should be imparted to the young people of the country who propose to give their after years to labour in industrial pursuits; and whereas there are no existing schools constructed or equipped to meet the necessities herein alluded to; resolved, that this Association use its efforts to induce the proper authorities to establish or contribute to the support of schools of art and design in the manufacturing centres of the country that will promote the growth and development of our industrial institutions." There is no reason why the Canadians should not possess sufficient aptitude to be turned to account in industrial art. The occasional examples of painting and drawing which are seen in England are at least equal to the average work of British artists.

THE American Society of Engineers have issued a series of rules relating to the reading and publication of papers, which are worthy of imitation elsewhere. They are as follows:—"(1) In preparing all papers, discussion and correspondence on technical subjects for the press, the third person shall be used. The contributor of a paper shall be referred to as 'the author,' a correspondent as 'the writer,' and one who contributes to the verbal discussion as 'the speaker.' (2) All redundant matter, interrogations which the text of the paper renders needless, and sarcastic forms of expression shall be excluded. (3) All errors in orthography and grammar shall be corrected. In cases where there are two correct spellings, that to which preference is given by the best authorities shall, for the sake of uniformity, be adopted. (4) Ambiguous or obscure statements shall be restated in clearer form, care being taken, however, to preserve as far as possible the language and style of the author. (5) No unnecessary changes in wording shall be made. (6) Whenever time will permit, a proof of any paper and discussion in which any changes indicated in rules 4 and 5 have been made shall be submitted to the author before publication. But in this connection it should be borne in mind that it is not always possible, on account of lack of time, to submit a proof, and that inasmuch as the first publication of all discussions will be a preliminary one, necessary corrections may be made before the final issue in the volumes of *Transactions*. (7) Oral discussions shall be reported stenographically. From this report a rearranged form of the matter brought out by the speaker shall be carefully prepared and forwarded to him, together with the full report of what he was understood to say, and whenever time permits any modifications or amplifications of this statement shall be printed in *Proceedings*. When it is not possible to secure the approval of the speaker prior to this publication, he shall be allowed to make corrections, changes or amplifications in his discussion before it is published in *Transactions*."

FIREMEN like Sir E. M. SHAW, who have had great experience with building material, generally express confidence in the endurance of sound timber amidst flames. The British Fire Prevention Committee's latest publication contains an account of an experiment which was made on a solid timber floor in March of this year. The floor measured 10 feet by 10 feet, and consisted of 9-inch by 12-inch fir beams laid flat on the walls and bedded in fireclay. The pieces had been used as strong struts, but the holes in them for bolts and mortising were filled with grouting. On the floor a load of bricks weighing a little over a ton was placed. The test lasted from 3.20 P.M. to 4.35 P.M., and the highest temperature was 19.55° Fahr. On examination it was found that the fire had penetrated from 1½ to 2½ inches, while the remainder of the beams were in as good condition when removed as when first operated on. The fireclay in the joints and holes prevented the fire from going through, and there, as in the bedding, remained perfectly soft. The boarding on the top of the beams was not scorched or damaged. The experiment is important from its confirmation of the opinion of experts. It was conducted by Messrs. F. R. FARROW, C. E. GOAD and ELLIS MARSLAND.

XXI.

Nevers—Paris.

THE afternoon heat was so intense that after a modest refection at an "auberge" in front of the abbey church (where the oddest collection of peasantry conceivable were gathered in discussion of a meal dignified by the name of déjeuner) I was fain to sit down under a hedge a little way out of Souvigny, book in hand, and forego the treat I had promised myself of seeing a Burgundian narthex and a unique chevet of narrow stilted arches at St. Menoux, distant about four miles. With an alternate glance at the brown stone, red-tile capped towers of the abbey down in the hollow to the left, and the pages of one of those delightful Thackerayesque sketches, in which the cloak of humbug and hypocrisy is twitched so forcibly and yet so good-humouredly, the time wore away until—one more stroll round the fascinating abbey having been obtained—I sought the return train for Moulins, at which cheerful little cathedral city I arrived once more, only to discover, to my chagrin, that the last slow train for Nevers had departed. However, I consoled myself with recollections of the very jolly-looking old Lady Abbess who had been my travelling companion during the twenty minutes' ride, and who had addressed some remark of polite conventionality in response to my salute on entering the carriage, but the import of which I had been unable to divine

NEVERS: HIGH ALTAR AND APSE OF CATHEDRAL.

owing to the noise and bustle attendant upon the departure of the train. However, I had bowed, looked pleasant, and made up for my seeming discourtesy by assisting her, on arrival at Moulins, with her packages; of which she had a great assortment in all shapes and sizes, including a bonnet-box—I opined it held her best "coif"—and a "Gampy" umbrella, a downright useful alpaca affair tied round the middle with a piece of string. She was met at the entrance to the platform at Moulins by another Mother Superior, very grand and stately.

Together they entered a small donkey-chaise, in which they drove off into the city in a cloud of dust with an air that the most expert "whip" might have envied, and as I wandered back to the Hôtel du Dauphin I recalled the following passage from Southey with reference to this devoted body of women:—"Two of them (for they generally go in couples) set out on their charitable mission. Wherever they go their dress protects them. Even more enlightened persons than the common peasantry hail it as a happy omen when on a journey a *sœur de la charité* happens to travel with them, and instances are recorded in which their presence has saved travellers from the attacks of robbers. During the Revolution they were rarely molested, being the only religious order permitted to wear their dress and pursue their vocation."

Much as I regretted not having prolonged my visit to Souvigny, I contrived in one way or another to occupy the evening at Moulins, and it sped away with as much expedition as could reasonably be hoped for, a capital band on the boulevards contributing materially towards this result, besides affording an excellent opportunity for observing the diversions of the Moulinais. The cathedral and church of the Sacred Heart both remained open until quite a late hour, so I sat about in them, much admiring the fine effect produced in the latter by the setting sun, which, streaming through the windows of the apse,* flooded the choir with gorgeous colours, the opposite end of the building being left in gloom. Wishing to get a good clear morning for visiting the various objects of interest in Nevers, and being moreover due at Vézelay on Friday, I took advantage of the Paris express which passed through Moulins at eleven o'clock. Soon we were flying through the silent night, a galaxy of lights relieving the monotony now and again as the train ran screaming through a station. After an hour's run, with the stop of a few minutes only at Saincaize, the junction for Bourges, the express rattled across the Loire, and on the stroke of midnight, with the lamps of the stone bridge at a little distance "shivering" with solemn effect in the stream, rushed into the dimly-lighted station at Nevers. Glad I was, after hurrying along the platform, tenanted only by a few sleepy-eyed children gnawing their way through indigestible-looking buns, to find the omnibus belonging to the Hôtel de l'Europe drawn up outside the door of exit, to throw myself into the remotest corner of the vehicle, which—the horse doubtless wanting to get home to its bed—thundered off into the city like a fire engine at full gallop. Past the cathedral, looming large against the midnight sky, it tore; threaded several tortuous streets; rumbled under the Port de Paris, and finally deposited me at the excellent Hôtel de l'Europe, whose night porter was sitting up in anticipation of late arrivals.

Nine o'clock on a glorious sunshiny August morning, and the *enfants du chœur* of St. Cyr's Cathedral at Nevers, in scarlet and white, are tripping down that spiral staircase which Prof. Willis has referred to as so remarkable a specimen of "interpenetration"—*i.e.* running of several series of mouldings into one another. Arrived in the great western transept, they proceed, after a little preliminary skirmishing, towards the choir, where several vicars-choral have already taken up their stations by the great books, ready to commence the morning offices. These are sung unaccompanied, but with much solemnity, to the old plain chant, which sounds, as always, very soothing and restful as I steal softly round the processional aisle behind the high altar. Here, while lighting their candles preparatory to the commencement of the Canon of the Mass, two of the aforementioned small individuals—who, by the way, take a ritualistic rather than a musical part in the function—are indulging in a little diverting by-play with the lucifer matches, luckily screened from the eye of the officiating priest by the retable and its ornaments. I then resume my seat at the summit of the flight of steps leading from the floor of the vast Middle Pointed church to its Romanesque western apse, upon whose conch is depicted a grand Byzantine Majesty, still looming through the veil of whitewash which, as far as practicable, has been removed from it.

Although Nevers Cathedral is wanting in some of those accompaniments which are the glories of its northern sisters, it is unquestionably a noble edifice, and must take a high rank among French churches of the second class from the excellence of its east end, from the elegance of its solitary tower, and from the imposing solemnity of its western crypt and apse, a feature which it shares with but one other French cathedral—that of Besançon.

* It will be remembered that the apse of this church faces the west, contrary to strict rules of orientation.

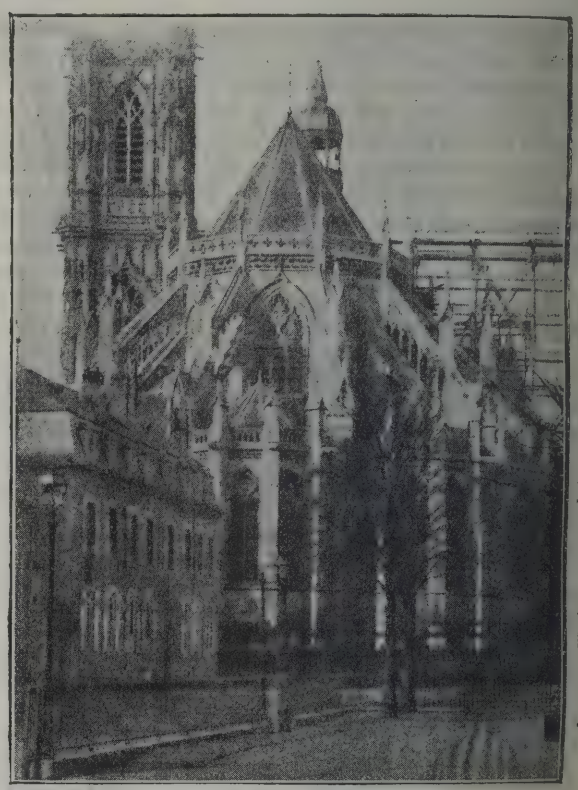
Some forty years ago St. Cyr was monographed by the diocesan Vicar-General l'Abbé Crosmier, who bore a very high reputation as an archæologist. Like its neighbour, Bourges, the cathedral of Nevers has no transepts,* otherwise it is of the customary French arrangement. The choir disorientates considerably to the south, and the florid Gothic tower stands just to the east of what must be looked upon rather as a gigantic narthex than a western transept. This forms, with the apse and crypt beneath it, the only portion of the original Romanesque church built by Hugh II., and whose date may be fixed at 1028.

It would appear that the cathedral of St. Cyr at Nevers was originally a church of that Romanesque type met with in the neighbouring province of Auvergne, as at Issoire and elsewhere. The whole of this Romanesque church, with the exception of the portions above mentioned, was swept away to make room for the present great Middle Pointed building.

The three-aisled crypt of the eleventh century beneath the western apse is, like the coeval one of St. Germain at Auxerre, very solemn and awful; indeed, it was quite a relief to emerge from its speluncar shade into the lightsome lantern-like upper church, whose beauties gradually unfolded themselves as I once more seated myself in the western apse, and took in the whole of its transeptless length, terminating in the modern Gothic baldacchino, at one glance. Six bays are assigned to the nave, that to the east being much wider and higher than the others. All are good Early Middle Pointed, and support a triforium of much elegance. This is composed of a series of trefoiled arcadings, the base of each shaft resting upon the caryatid figure—if such an expression can be used in describing a Gothic church—of a saint.

The clerestory windows are large ones of two broad lancets under a depressed arch, like those in the same situation at Seez; each has by way of tracery a lozenge-shaped piercing in the head. As there is but little stained glass, the flood of light poured in through these great windows gives to the church—at any rate to the eye of the visitor with the storied solemnity of Bourges, Chartres, Auxerre and Troyes fresh in his mind—an air of coldness, intensified by the recent scraping to which the whole interior has been subjected.

The choir of four bays is very tolerable Late Middle Pointed, but its circumambient aisle and chapels are gems of thirteenth-century work. Perhaps the most graceful feature of the choir is its glazed triforium, which, like that at Tours, is a continuation downwards of the clerestory. All the windows in the eastern apse are filled with modern stained-glass—pleasing in ensemble, but lacking distinctness from the smallness and multiplicity of the subjects which are placed in medallions, as well as from the preponderance of blue.



The chapels radiating from the procession path are, as I have mentioned above, the best thirteenth-century work. Throughout, the detail, and especially that of the foliaged ornament, is executed with the utmost care, and has received the highest eulogiums from the graceful pen of Elisé Reclus:—"On y reconnaît tous les feuillages de nos bois, et de nos champs, la feuille de chêne, de peuplier, de roseau, de chardon-frisé, &c.; la perfection de l'imitation, et la finesse de travail, sont réellement admirables." This same fidelity to nature is observable in the foliaged capitals to the pillars of the great north door, by which the cathedral is usually entered from the city. "Les archivoltes des portes," continues our author, "attestent également la patience et l'adresse des ciseleurs du xv^e^ siècle."

Each of these radiating chapels at Nevers has five windows of two lights each; their tracery, like those in the clerestory of the apse, where it is composed of three large trefoils, is Geometrical Decorated.

As in the neighbouring cathedral of Moulins, the high altar and its accessories at Nevers have been restored in the Mediæval style, piscina and credence being duly provided.

The mensa of stone rests upon six small pillars, but, unlike that at Moulins, is destitute of frontal. There is a very pretty stepped predella with small carved subjects from the Passion, and this supports the crucifix and candlesticks. Over all rises a baldacchino, similar in "motif" to that in the cathedral at Moulins, but of stone, and exclaiming loudly, as does the whole of the stonework, for the polychromatic decoration which, I was informed, it was intended to apply to it. Each side of the baldacchino has a trefoiled arch beneath a gable, and from its low roof sprouts an open-work spirelet. A rood-beam sustaining a crucifix spans the arch of the apse immediately in the rear of this baldacchino.

At the time of my visit all the *instrumenta* were in a very inchoate condition. I noticed that the old Grecian stalls with high wainscotted backs relieved by Corinthian pilasters had been retained, but the organ case had not been replaced, the instrument standing beneath one of the arches to the north of the choir, and looking more like a great pyramidal-topped packing case than anything else.

NEVERS: EAST END OF CATHEDRAL.

While sitting at the top of the steps leading to the western apse, a Sœur de la Charité directed my attention towards a small door just to the left of the space in which the altar stood, so, thinking that in all probability it conducted to some interesting and as yet unexplored part of the cathedral, I passed through it, only to find myself in a long, barn-like room which, fitted with sash windows of the most domestic description, and tricked out with bannerets and bits of calico stuck about wherever it was possible to stick them, presented the most perfect picture of a "rag-fair" presented by any Roman Catholic church of my acquaintance—English or foreign. To whom it was dedicated I did not pause to inquire, but after one glance of disgust around, tempered by the consolatory reflection that such a display of motley had been banished hither from the cathedral proper, I turned and fled towards that typal church of the Auvergnat Romanesque, St. Etienne, noticing, by the way, the fine grouping of the apse of the cathedral with its solitary steeple. This last stands on the east side of the south-west transept, and is of a type rather common in this part of France—Clamécy, of which more anon, and St. Pierre at Auxerre possessing very similar ones. Of two epochs, this tower at St. Cyr, Nevers, is very striking in its outline. The lowest part, which reaches to the top of the clerestory, and presents a double series of trefoiled arcades, belongs to the close of the fourteenth century; the second portion, dating 1509-28, is almost covered with niched statues of saints; the highest, or belfry stage, has one window of two lights in each face, and is surmounted by a very graceful pierced parapet. There is a turret at the north-west corner, but no spire or

* The omission of transepts is evidently a "localism." Compare Varzy, Clamécy, and the more distant seventeenth-century church of St. Pierre Auxerre.

capping of any kind, and an effect of combined elegance and solidity is imparted to the mass.

A saunter through a variety of quaint and unexpected by-ways brought me to the church of St. Etienne. It is cruciform, perfectly regular, has the eastern apse and two side ones radiating from the procession path; a low tower (longer from north to south than from east to west), and surmounted by a stunted octagon; a western narthex to its nave, and all those details which have as distinct and marked a tradition of their own as those met with in the Romanesque of the Rhine or Normandy or Pisa or Lombardy.

Much of the beautiful local colouring of St. Etienne externally has been lost by merciless flaying, which process the west front was in 1894 undergoing. The three Romanesque arcades at its summit were then untouched, but I trembled for their safety. In their unrestored condition they were a poem. From the east side of either transept projects an apsidal chapel, which, taken in conjunction with those radiating from the procession path, the red-tiled roofs and the small arcades relieving the wall of the apse clerestory just under the eaves like the Rhine churches, help to compose a very pleasing but by no means gigantic ensemble. A painting of 1609 suspended in the church shows the central tower surmounted by a very tall octagonal spire of four stages; of this the base, relieved on its cardinal sides by arcading, alone remains.

Internally, St. Etienne forms a striking contrast to the delicacy of detail and luminousness which are the characteristic features of St. Cyr. Here all is sternness and simplicity, allied with solemnity, brought about by the modicum of light which the round-headed windows admit. A peculiar feature here, as in many Romanesque churches of the Auvergnat type, is the arch opening into the transept—not the one at the crux, but that which is on a level with the walls of the aisles—a feature rendered necessary by the elongation of the tower from north to south. At St. Etienne this arch is pitched low, the wall space between it and the transept roof being pierced with five arcades. And here is another feature of this peculiar type of Romanesque—*i.e.* the blind arcading in the north and south walls of the transepts, where a straight-sided arch occurs between two circular ones.

The apsidal chapel opening from the north transept retains its original features—*i.e.* three Romanesque windows within arcades upon shafts with thick square caps. The chapel opening from the opposite transept is a restoration, replacing a later one, and therefore less interesting. The apse of the choir has its dome perfectly plain; here are five very narrow and stilted arches; beneath the tower the chorus cantorum is formed; its stallwork of the last century is tolerable.

Another walk round the spacious aisles of the cathedral and it is time to start upon the first stage of the route towards Vézelay. To reach this retired spot either from Nevers or Avallon the best plan is to take the train to Sermicelles, a small village on the line between these two important towns. Thence it is but a six-mile walk—and a most charming one, too—to Vézelay. Or, by writing to the Hôtel de la Poste there, an omnibus will meet the train specified. I, however, am not only anxious to see the church at Clamécy, but to get a good long day's walk, and Clamécy being 18 miles from Vézelay this latter is easily secured.

Trains on the line between Nevers and Avallon not being frequent, that starting from Nevers at five o'clock is somewhat inconveniently crowded. Several children are of the party in my carriage, but of their presence during the earlier stage of the journey I am not aware, since they are being sat upon by the adult portion thereof.

Urzy, Guérigny, Poiseux, Prémery, Arzembourg, Corvol l'Embernard and Varzy—the last with its fine twin-steepled but transeptless church—are in turn passed by this most sluggish train, towards whose depopulation each village contributes its quota, attended by much scrunching of saboted feet on wet gravelled platforms, and much difficulty in putting up of serviceable-looking gig-umbrellas. The remaining occupants of my compartment during the last twenty minutes or so are a disagreeable-looking woman with the afore-mentioned hitherto half-concealed children, who, like the ladies at Queen Anne of Denmark's funeral, becoming tired with the length of the way, grow extremely fractious and unpleasant, receiving, as a relief to her own perturbed spirits, sundry pecks from the maternal bird in the shape of taps and pushes. These are subsequently exchanged for slaps, and remainder of the journey is performed to the accompaniment of weepings, both within and without—a drizzling rain, commencing shortly after quitting Nevers, developing, by the time Clamécy is reached, *i.e.* 7.15 P.M., into a good steady downpour. A small omnibus from the Hôtel Boule d'Or is drawn up outside the station, but finding that it is in waiting for the "down" train from Auxerre, I appropriate an old brougham and drive off in it to the above-mentioned hostel, in whose salle à manger I am presently engaged in discussing an excellent dinner, solus, hazarding many conjectures as to the ecclesiastical character of that apartment, in each angle of which is a cluster of Romanesque shafts.

Early the next morning I visited the church at Clamécy—a transeptless structure in vigorous and very Early Pointed, with a Late tower similar in outline to that at Nevers standing outside the line of the south aisle, and a square, circumambient-aisled east end like Moulins.

Returning to the Hôtel Boule d'Or I set out, with a southerly wind, a cloudy sky and the leaping Yonne as companions, to walk to Vézelay; but as I intend making that most remarkable of Burgundian Romanesque churches the subject of a separate paper at a future day, I will merely say that, after paying it more than one enraptured visit, I quitted the decayed hamlet which it so proudly dominates on the morning of Saturday, August 4, 1894, for Paris, *viâ* Avallon, Auxerre and Sens, both of which latter I revisited with, if possible, increased delight. I heard the morning offices on Sunday at Auxerre, and those of the afternoon at Sens.

Clearing out with cargo from the last-named archiepiscopal city at five o'clock on Monday morning, I fondly hoped to arrive in the gay Lutetia in ample time to catch the tidal train for Dieppe and Newhaven at nine o'clock, but alack, alack!

> The best laid schemes of mice and men
> Gang aft aglee.

The train is behind its time, and the great bell of Notre-Dame is sending its voice over what Mrs. Skewton called "that delightfullest of cities" for the morning offices. So, dismissing the vehicle at its portals, I enter the great five-aisled Transition church, which looks—but that it always does—most solemn in this soft morning light. A peculiar effect is produced by two sunbeams darting down on to the floor of the choir through the opened panes in the central windows of the apse—a piece of utilitarianism, if such it may be called, rendered necessary by the quantity of stained-glass in the other windows, and through which the sun's rays are able only to filter upon the massive Transitional piers and the high, close stallwork of the Renaissance.

Passing up the south aisle I take a chair, one of an empty collection very much at my service beneath the great crossing, and, banishing all thoughts of trains and steamboats, though the latter are brought to the recollection unpleasantly by the shrill whistles now and again of their small brethren on the river just outside the cathedral, compose myself to listen to the solemn, unaccompanied plain song of Terce.

Towards the conclusion of the office a few more canons take their stalls in the choir, one officiating at the *orgue d'accompagnement*. As he plays a soft introduction to the introit for the day—the festival of the Transfiguration—the officiating clergy in rich vestments of white and gold come slowly from the sacristy. At the offertorium I leave my seat in front of the choir and steal round to the *pourtour*, whence I am enabled to obtain an uninterrupted view of the ritual of the altar, which, as becomes the metropolitan cathedral, is carried out with much grandeur and decorum.

Outside the choir I was the only person "assisting" at the office: here are a few devotees, including several Sisters from the Hôtel Dieu and a few other people merely sightseers, who, to my surprise, are allowed to circulate and stare about them during the performance of this, the Church's highest office.

After this comes a long day in Paris, the note-book and pencil being kept active in visiting the Sainte-Chapelle, with its priceless store of coeval painted glass; SS. Paul and Louis and St. Louis en Ile, showy structures in modern Italian;

St. Germain des Près, St. Sulpice, St. Severin, St. Etienne du Mont, St. Eustache and St. Médard, all of which are so well known as to exonerate me from attempting any description of them.

Returning to the eastern quarter of the city, the day's proceedings are agreeably diversified by a stroll across the Jardin des Plantes, and about two o'clock the bells of Notre-Dame begin to sound for the post-prandial offices.

This time I do not enter the choir, but remain in the nave, leaning against the pillars and finding out fresh beauties in this wonderful edifice at every point. Most impressive is the flood of organ and chant as it steals about the double aisles, and the effect of a solitary treble voice, softly accompanied on the organ in the versicle following Nunc Dimittis, "In manus Tuas, Domine, commendo spiritum meum," forms a peculiarly solemn and restful ending to the day's services.

With this and the melody of the concluding antiphon, "Salva, nos Domine, vigilantes: custodi nos dormientes," I emerge once more into the brilliant sunshine of Place and Boulevard.

PARIS: WEST FRONT OF NOTRE DAME.

Bending my steps northward this time, I seek Hittorff's basilica of St. Vincent de Paul, and sit awhile in its impressive triple-aisled nave, whose columniation is divided into two orders—Ionic below, Corinthian above—with a broad strip between, like, but much loftier and more important than, the gallery front of a Wrennian church, as, *e.g.*, St. Andrew's, Holborn, and St. James's, Piccadilly. As in these two examples, the constructional gallery at St. Vincent de Paul forms a noble feature. Taking as his motif St. Apollinare Nuovo at Ravenna, Hippolyte Flandrin covered this band, which is equivalent to the triforium of a legitimate basilica, with long processions of saints on a gold ground—all reverently tending towards the high altar.

One hundred and fifty in number, and branching off right and left in two groups from an altar painted in the centre of the western band, which in that portion of the church forms the front of the organ loft, these figures seem to advance towards the Session in Majesty filling the conch of the apse.*

This was the work of Picot, decidedly creditable, but not to be compared with that of Flandrin.

A somewhat serious drawback to the otherwise fine interior of St. Vincent de Paul is the expedient adopted by the architect to obtain space for his apse. Making the extremity of the radius the pillars, not of the nave but those between the inner and outer aisles, he has caused his inner aisle to discharge itself suddenly into the apsidal hemicycle—a contrivance which cannot be regarded but as theatrical, and totally upsetting the gravity of basilican architecture.

From the west end of the church this arrangement does not force itself unpleasantly upon the view, but within the apse the effect is ruinous.

Barring this drawback, St. Vincent de Paul must be considered the most impressive and religious modern church interior Paris possesses, and it made a thoroughly satisfactory ending to a tour which had embraced so many, grand, and varied specimens of French ecclesiastical architecture.

(To be continued.)

* These paintings were disclosed to public view in 1853. The church, from the designs of Hittorff, had however been completed nearly thirty years before.

CELTIC ORNAMENTS FOUND IN IRELAND.

IT will be remembered that questions were asked in the House of Commons concerning the purchase of some goid ornaments which were found in Ireland. They were purchased for the British Museum, although in the opinion of some members the proper place for them was in the Dublin Museum. It was also alleged that the Edinburgh Museum was sometimes compelled to succumb to the British Museum when Scottish work was in the market. A commission was accordingly appointed for the following purposes:—

To inquire into the circumstances under which certain Celtic ornaments found in Ireland were recently offered for sale to the British Museum.

To consider and suggest regulations for avoiding undue competition between museums supported out of public funds in Scotland and Ireland on the one hand and the British Museum on the other, for the acquisition of objects of antiquarian or historic interest, and for insuring that in the case of objects which from their origin or associations are of peculiar interest either to Scotland or Ireland, the museum situated in the country so interested should be afforded an opportunity of purchasing them before they are acquired by any other institutions supported out of public funds, and to consider whether any, and if so what, relaxations should be made in the regulations (statutory or otherwise) which prevent the British Museum parting with objects which it has once acquired.

After the examination of witnesses and the consideration of other evidence, the following report has been issued:—

We have considered the several questions referred to us by your Lordships' minute of October 24, and we have the hono ur to report upon them to your Lordships as follows:—

I. "To inquire into the circumstances under which certain Celtic ornaments found in Ireland were recently offered for sale to the British Museum."

The objects mentioned in the first paragraph of your Lordships' reference consist of—

1. A hollow collar, in two sections, with elaborate repoussé ornament of eccentric curves.

2. A model boat with eight thwarts (originally nine), and a number of oars, spars, &c.

3. A hemispherical bowl of thin metal, with four rings at the edges for suspension.

4. A solid gold torc of stout wire, with a thinner wire twisted round it.

5. One half of a similar torc.

6. A necklace, formed of three plaited chains, with a peculiar fastening, and

7. A thin, single chain necklace of the same plaiting.

These objects are stated to have been found early in 1896 by a farm labourer whilst ploughing the lands of Mr. Joseph Gibson, in the neighbourhood of Limavady, in the north-west of Ireland; and they afterwards came—how, it does not clearly appear—into the possession of Mr. Gribben, a jeweller of Belfast, from whom they were purchased by Mr. Day, who is a collector of antiquities, a member of the Royal Irish Academy, and a Fellow of the Society of Antiquaries of London.

The above statement as to the circumstances under which these articles were discovered was furnished to us by Sir Patrick Coll, Chief Crown Solicitor for Ireland, as the result of inquiries made by the police upon the spot (but at a subsequent period); and he added that the facts so stated led him to the conclusion that the articles were treasure trove, and that they could now be proved to be so if the persons who knew the facts would give truthful evidence. The Attorney-General for Ireland, in answer to a question put to him in the House of Commons, during the last session of Parliament, expressed his opinion to the same effect.

The law and practice as to treasure trove in Ireland, so far

as it is necessary for our purpose to consider it, may be shortly stated as follows :—

"Treasure trove," says Sir Edward Coke, "is when any gold or silver in coin, plate or bullion hath been of ancient time hidden, wheresoever it be found, whereof no person can prove any property," and such treasure belongs to the Sovereign by prerogative (unless an express grant of the franchise of treasure trove can be established). It is usually given up to the police, or reported to the Government, and concealment of it is an indictable offence punishable by fine and imprisonment. The disposal of treasure trove is in the absolute discretion of the Treasury, acting on behalf of the Crown, but for many years the Treasury has had not direct dealings with treasure trove in Ireland, the whole responsibility in connection therewith having been delegated to the Royal Irish Academy. One hundred pounds (included in the Royal Irish Academy grant in aid) is annually provided by Parliament for rewards to discoverers of treasure trove, and this sum can be accumulated from year to year. The Academy posts notices in the constabulary barracks and other places throughout Ireland informing the public that payments for such articles, higher than those which could be obtained from dealers, will be awarded to finders of them who deliver them up to the police. The Government always give the Royal Irish Academy the refusal of treasure trove thus recovered in Ireland.

If, therefore, the hoard found near Limavady be treasure trove it ought according to law to have been delivered up to the police or the Government of Ireland, and it would in that case no doubt have been handed over to the Academy to be kept under their charge in the National Museum of Ireland. That museum contains one of the most valuable series of this kind of gold ornaments now existing, though, according to the evidence of Mr. Read, the best collection of general objects belonging to the class of late Celtic antiquities is to be found in the British Museum.

It appears, however, that Mr. Day having obtained possession of these objects in the manner above described offered them for sale to the British Museum under the circumstances which are set forth in the following memorandum prepared for us by Sir Edward Maunde Thompson :—

"In the autumn of 1896, Mr. Robert Day, F.S.A., a well-known collector of works of art and antiquities, living in Cork, informed Mr. C. H. Read, the keeper of the British and Mediæval antiquities in the British Museum, that he had secured from a silversmith some very fine gold ornaments of late Celtic work. Mr. Read, who is also the secretary of the Society of Antiquaries of London, suggested to Mr. Day that the Society should have an opportunity of seeing them.

"Accordingly, Mr. Day exhibited the ornaments at a meeting of the Society on January 14, 1897, and an account of the meeting appeared in the *Athenæum* newspaper of January 30.

"Meanwhile, Mr. Read having expressed an opinion to Mr. Day that these important objects should pass to the British Museum, should he at any time part with them, negotiations followed, with the result that Mr. Day offered the collection to the Trustees of the British Museum for the sum of 600*l.*

"Mr. Read recommended the purchase to the trustees in a report of April 5, 1897.

"The Trustees sanctioned the purchase at a meeting of the standing committee on April 9, 1897. The order for payment was issued on May 13.

"E. Maunde Thompson."

At the meeting of the Society of Antiquaries above mentioned, a paper was read by Mr. A. J. Evans, Keeper of the Ashmolean Museum Oxford, in which he said :—"There is at least no question as to the indigenous Celtic character of the most important relic contained in the Irish hoard. The collar gold collar, with its bold repoussé designs, is undoubtedly an ancient Irish fabric, and is at the same time the finest example existing of this class of work." Mr. Evans seems also to have been of opinion that probably the golden boat, and possibly the other objects, with the exception of the triple chain, were of Irish origin. On the other hand, Mr. C. H. Read contended, in the course of his evidence before us, that there was no proof that any one of these articles was made in Ireland.

Dr. Atkinson, who is secretary to the Council of the Royal Irish Academy, stated to us that that body had no knowledge of the "find" in question until the publication of the *Athenæum* newspaper (January 30, 1897), that they then immediately appointed a committee to consider the circumstances thus disclosed to them, and that he was directed to make inquiries of Sir Patrick Coll (as Chief Crown Solicitor for Ireland), by whom he was told that the Irish Government had no information on the subject, and that they could not move the constabulary to act until further particulars were furnished as to the time and place of the discovery. No other steps were taken by the Academy from that time (February 1897) until February 1898, and it appears to us that if this treasure had been upon the market throughout that interval there would have been some danger of its being sold out of the country and thus lost to our national collections; but Dr. Atkinson, in explanation of this seemingly long delay, said that he was satisfied that the articles were *primâ facie* treasure trove, and that as such they would surely be brought to the Academy for valuation and for subsequent deposit in its custody; that he did not believe that treasure found under such circumstances could be properly purchased by anyone; and that, in fact, he had no knowledge of the purchase actually made by the British Museum (in April 1897) until the beginning of 1898. With regard to the value of the objects, Dr. Atkinson stated that the Academy might have given 200*l.* or 250*l.* for them, but that on his initiative the Council would not have offered any such sum as 600*l.*

Early in the Parliamentary session of last year questions were asked and a discussion arose in the House of Commons, wherein it was on the one side stated that the hoard in question, when found, was treasure trove; that the claim of the Crown to it as such had not been defeated by anything which had afterwards happened, and it was argued that the treasure ought, therefore, to be recovered by the Government and handed over to the Royal Irish Academy; while on the other side it was contended that, apart from other objections to such a course, the authorities of the British Museum were precluded by the statutes which govern that institution from parting with such possessions even were they so minded. We shall not express any opinion upon the merits of this controversy, as the terms of your Lordships' reference do not invite us to do so.

We have to add that Mr. Day on April 13, 1898, wrote to the Chancellor of the Exchequer that he was willing to repay the Trustees of the British Museum 600*l.* if they would transfer to him the ornaments in question, which he would hand over to the Royal Irish Academy on their reimbursing him. This offer, however, was withdrawn by Mr. Day on May 19, 1898, and the objects remain in the British Museum.

II. "To consider and suggest regulations for avoiding undue competition between museums supported out of public funds in Scotland and Ireland on the one hand and the British Museum on the other, for the acquisition of objects of antiquarian or historic interest, and for insuring that in the case of objects which from their origin or associations are of peculiar interest either to Scotland or Ireland the museum situated in the country so interested should be afforded an opportunity of purchasing them before they are acquired by any other institutions supported out of public funds."

We are of opinion that, should it at any time be deemed advisable to make regulations for the purposes set forth in the second paragraph of your Lordships' reference, such regulations should be framed so as to provide that whenever it specially comes to the knowledge of the officers of any one of these institutions that objects which from their origin or associations appear to be of peculiar value to either of the others have been offered, or are likely to be offered for sale, information to that effect should at once be conveyed to the body so specially interested with the view of its having the first opportunity of purchasing such objects, and that in order to avoid as far as possible the chance of undue competition a friendly understanding should be arrived at as to what would be a reasonable price to give for the articles in question. These regulations might be framed for their own use by the Trustees of the British Museum and by the authorities of the other institutions respectively. But due care ought to be taken, both in the drafting and enforcing of such regulations, to provide against the risk, by delay in concluding a bargain or otherwise, of the desired objects being lost to all three museums.

We have, however, to report that the utmost goodwill has generally prevailed between the authorities of the British Museum on the one hand, and those of the museums of Edinburgh and Dublin on the other; that the former have on several occasions zealously assisted in securing for the latter objects which seemed to have a preponderating value for their collections, and further that, setting aside the very exceptional circumstances of the recent discovery in the North of Ireland with which we have already dealt, your committee have found only one instance in which such undue competition as is contemplated in your Lordships' minute has been made matter of complaint. That was the purchase by the British Museum of the "Glenlyon Brooch," an object long associated with a Scottish family, the Campbells of Troup, which the Council of the Society of Scottish Antiquaries were most anxious to obtain; but the evidence we have taken leads us to the conclusion that the contention in that case arose mainly, if not altogether, out of a misunderstanding between Mr. Read and Mr. Carfrae, the agents who represented the British and the Scottish museums respectively at the auction. Sir Edward Maunde Thompson told us that if the matter had been brought up for consideration in sufficient time beforehand he would have advised the Trustees of the British Museum to give way, while Mr. Read stated that if he had known that Mr. Carfrae was prepared to bid a sufficient sum to secure the brooch, he would have taken the responsibility of retiring from the competition, and we think it not unlikely that the desired object might, even after the sale,

have been returned to Scotland had not the statutes which govern the British Museum made such a proceeding impossible.

The policy indicated in the paragraph of your Lordships' minute now under consideration has been to some extent challenged by gentlemen who gave evidence before us, but we are satisfied, having regard to the friendly relations which have with such slight interruption existed between the authorities of the three national museums, that if that policy were accepted by them in the spirit which has hitherto in the main so happily prevailed, effect could well be given to it by their spontaneous co-operation.

III. "To consider whether any, and if so what, relaxations should be made in the regulations (statutory or otherwise) which prevent the British Museum parting with objects which it has once acquired."

In answer to the third paragraph of your Lordships' reference, we beg to say that the majority of the witnesses heard by us were in favour of relaxing to some extent the statutory provisions which prevent the British Museum from parting with objects which it has acquired (unless such objects are duplicates or are deemed by the Trustees unfit for remaining in the collection), and we recommend that the necessary steps should be taken for that purpose; but we think that the conditions under which the Trustees should be enabled to dispose of any property of which they are thus possessed ought to be very carefully considered, and we would suggest that such relaxation might perhaps be confined to cases in which the Trustees may in their discretion be willing to transfer, by way of exchange or otherwise, some article in their possession to one of the other national museums.

We venture further to recommend that corresponding relaxations should also be made in the rules which now impose on the national museums of Ireland and Scotland restrictions similar to those above mentioned as controlling the British Museum under its statutes, and that in all cases such transfers should be sanctioned at a general meeting of the trustees, or of the Councils of the Royal Irish Academy and the Society of Antiquaries of Scotland respectively.

In conclusion, we desire to express our sense of the valuable services rendered to us by Mr. E. G. Harman and Mr. L. J. Hewby, who have successively acted as secretaries to this committee.

RATHMORE.
JOHN MORLEY.
JOHN LUBBOCK.
JOHN EVANS.
HERBERT MAXWELL.
THOS. H. GRATTAN ESMONDE.

L. J. HEWBY, secretary.
April 5, 1899.

We have signed the above report, with which we are in general agreement, but as regards Part II. we think that the initiative should be taken by the authorities of the museum desiring to purchase any special object; and as regards Part III., though we admit that in some few cases the change suggested might be desirable, we think that the balance of advantage rests with the present system. If, however, any change be made we accept the provisions suggested in the report.

JOHN LUBBOCK.
JOHN EVANS.

URICONIUM AND CALLEVA.

AT the annual meeting of the Shropshire Archæological Society Mr. St. John Hope moved:—"That the Council of the Shropshire Archæological Society, with power to add to their number, for this purpose be a local committee to co-operate with the London committee in carrying out the work of exploration, and that subscriptions promised, if possible, for five years, be invited to defray the heavy expense involved." According to the *Shrewsbury Chronicle* he said that living, as he had the good fortune to do, in what he might call the centre of the archæological world, he could candidly say that one of the most desirable works to undertake in the interests of archæology was the systematic exploration of Uriconium in the same way and on the same lines that had been adopted at Silchester. There they had been working for nine successive years, and although at first people said it was absurd to attempt to explore a site of 100 acres, they had already finished some sixty of them, and in the course of their operations some most interesting discoveries had been made. There were four things to be taken into account before anything could be done in the way of commencing to excavate. They had to get the consent of the owner of the soil, and he was happy to say they already had that permission; then they had to make satisfactory arrangements with the tenant, and these he trusted would soon be brought to a successful issue. In the third place, they had to obtain the co-operation of a committee of experts who would supervise the work; and, fourthly, they had to secure the necessary funds. With regard to the third requirement, it was most necessary that there should be people of experience to direct those who would have to carry out the heavy part of the work, for if those engaged did not know what to look for, nor the value of things they came across, their labour would be in vain. At Silchester one member of the small committee was always on the site directing operations and seeing that everything was carried out in a proper way. This committee was entirely independent from another point of view. They did not have to employ draughtsmen, but made their own plans on the spot, the result of each year's work being afterwards transferred to a large map. Any antiquities discovered which were worth keeping were taken away, while those which were practically refuse were buried again. When any important buildings were come across, careful models were taken before the structures were covered up. He mentioned that some very curious results were obtainable from the bones of animals killed by the inhabitants of this Roman city for food. When compared with the bones of existing sheep and oxen, it was found that the former belonged to totally different grades, being altogether smaller in build, and presenting peculiarities of considerable interest. When they realised that these creatures lived more than a thousand years ago, it was remarkable to see what progress had been made in the breeds of animals in that period. With regard to the cost of the proposed work at Silchester they said they would want about 500*l.* a year, which they were told they would not get, but in nine years they had collected and spent 4,320*l.*, which divided by nine came to nearly 500*l.* a year. They had no difficulty whatever in getting it. In carrying out these excavations, they had to bear in mind the fact that the tenant must not be put to any loss. They took out of cultivation so many acres for the year, and the tenant was paid a sum per acre, which he named, so as to protect himself. Considering all the expenses which the operations would entail, the committee would require the minimum sum of 500*l.* a year, and in order that the work might be carried to a satisfactory termination, it was necessary to have a guarantee fund for five years; and at the end of that period, if the subscribers considered the result satisfactory, it was to be hoped that they would continue their subscriptions, for in course of time the committee hoped to produce such discoveries as would show that the work was being carried out with the best possible results. Mr. Hope then went on to speak of the mode of procedure adopted in carrying out the explorations. He said they took so many acres each year, according to the convenience of the farmer; these were pegged out in the autumn and left until the following year, when the work of excavating was begun. Experienced workmen were employed, and the ground was so trenched that nothing of any size could escape notice. At Silchester very little of consequence was found in the buildings, but a large number of antiquities were discovered in the numerous rubbish pits with which portions of the site were honeycombed. So far as Uriconium was concerned, he did not think that previous explorers knew of the existence of these pits, so that they had not been excavated, and the work when undertaken was likely to lead to some remarkable discoveries.

Mr. G. E. Fox seconded the resolution. He said that Mr. Hope having submitted such matters connected with the project of excavation of Uriconium as more immediately concerned the financial side of the question, he might perhaps be permitted to give some short account of what would be their plans in this excavation from the purely archæological point of view. To do this as clearly as possible, he proposed to give a slight sketch of the exploration of a kindred site to that of Uriconium, viz. Calleva (Silchester), where for the last nine years a committee, of which Mr. Hope and himself were two acting members, had been employed in unearthing a Roman city. It might be taken for granted that under very similar circumstances their action on the site in Hampshire would be repeated on the one in Shropshire. In 1890 the Silchester excavation committee was formed and the work begun. The site, surrounded by its Roman wall, covered an area of 100 acres. Within that wall the roadways or streets of the ancient town were occasionally revealed in the growing crops by the stunted state of the vegetation upon them. The excavations of the first year revealed two fine houses built round courtyards and a wonderful find of iron tools, which had evidently been hidden away and the place of hiding forgotten. In the same year the great double west gate of the city was uncovered. The next year was less fruitful in discoveries, but the third season made up for any deficiencies in the second, for in this year they carried out the examination of the forum and basilica of the Roman town. But what fully rounded off their season's work was the discovery of the foundations of a Christian church at the south-east corner of the forum insula, the remains of which were the only definite relics of a church of the Roman period existing in this country. In the following years blocks to the south were excavated. Perhaps the discoveries of the

ear 1894 were the most notable they had made, for in that ear they came upon extensive traces of what must have been, t one period, the predominating industry of the city. The locks along the main road from the forum to the west gate ere lined with the foundations of dyers' workshops, and scat-ered over the ground about them were traces of the furnaces f dye-vats and deep water pits. In later explorations in the nore central portions of the town they came across the founda-ions of important dwellings for the first class, one of which ontained a long suite of chambers, each with a fine mosaic oor of elaborate braidwork or fretwork patterns. Last year he traces of an early house of half-timber construction—of the ame sort of construction as was to be seen in so many of the ouses of Shrewsbury—were uncovered underlying a later, ut still early, house built above it, and in this again ere fragments of a pavement of the best kind of mosaic, tesselated floor probably the most ancient in date yet ound in Britain. Furthermore, the indications of a water upply leading from without the town on the west towards the asilica were come upon. He had said thus much of the ndertaking at Calleva in the hope not only of showing what vas to be found on the site of one Roman city, but what they night trust to discover on that of another, viz. Uriconium. Perhaps the objection might be made, "Yes, but if you have lug up one city and found so much, why do so with another, vhere you will only be repeating your discoveries?" The nswer to that question was that they did not expect to find in Jriconium a repetition of what they had found at Calleva; and hey knew for a fact, from the result of the excavations made at Jriconium in 1859-61, that decided differences of plan and osition were to be seen between the public buildings of the ne and the other city. At Calleva (Silchester) the forum was djacent to the basilica on its eastern side; at Uriconium the ublic baths take its place, but lie south of the basilica. The orum was yet to be found. Again, the walls of Calleva nclose an irregular octagon of 100 acres; those of Uriconium long pear-shaped area of about 170 acres. What further ifferences there were had yet to be sought, but differences ere surely would be. Let them now turn to the plan of Jriconium, and see what it presented to them. The place lay etween three and four miles from the foot of the Wrekin, and lose to the Severn, which, making a great bend, runs along a part f the western side of the city. A brook, the Bell Brook, rossed the area at its upper part, and here the ground was nore varied in level than elsewhere. Near where this rivulet rossed the site of the city wall the road from Shrewsbury ntered the place. The wall was now nowhere to be seen, but s foundations existed beneath the surface of the fields, and the uge ditch which lay in front of it could still be made out here nd there in the circuit, which was between two and three iles in extent. At one point north of the brook, on the north-astern side, not far from the ancient road called the Watling treet, this trench was very evident and there appeared to be aces of a gate. As for the other gates, their position could ot as yet even be guessed at, except perhaps the southernmost, the point of the site within which is situated the village of Vroxeter, and possibly even the northern one towards Norton. Vithin the area formed by the wall and ditch the long road om north to south might represent the principal way of the oman town, more especially as most of the discoveries of uildings had been made along it in the last hundred years. he traces of a portico of square piers were uncovered in a ackyard almost at a central point on this road between the orth and south gates in 1855. Some distance south of this, the year 1788, the baths of some great mansion were iscovered, but only the baths; the discovery was pro-ecuted no further, unfortunately. Then further south gain, not far from the village church, in 1827, in another ackyard, a mosaic pavement was uncovered. This the eople of Shrewsbury carried away piecemeal—not, however, efore some excellent person had made a sketch of it. The eople of Shrewsbury would be much too intelligent to do ch a thing nowadays, and would doubtless prefer to see the erfect floor in their museum, which would certainly be the se if the Society had the taking of it up. These, with a few her remains of little importance, were all that had been und on the site until the year 1859, when under the auspices the Shropshire Archæological Society something like serious erations were begun and conducted from that date till 1861 y Mr. T. Wright, F.S.A. When that gentleman undertook e work, nothing Roman remained above ground save the huge ece of wall, a little removed from the main road north and south, nd about the middle of the site, which had passed for centuries nder the name of the "Old Work" of Wroxeter. The obvious ing to do was to make this wall a starting-point, and digging as commenced against it, when it was found to be the end of wall continuing for a length of 229 feet westward. Then nother wall was uncovered at a distance of 67 feet from the rst, and parallel to it, and then other walls at right angles to ese showed the existence of a great quadrangular hall, which bsequent diggings proved to have been divided by rows of columns into a central nave with aisles on each side, floored with mosaics. This was the basilica of Uriconium, but it differed both in plan and dimensions from the Callevan basilica, in that it had no apsis or semicircular ends, and that its western end showed three doorways, the eastern end only being reserved for the magistrates' tribune. This building was never properly examined, for disputes arose with the tenant of the ground at the time, and the diggings were abandoned soon after they had begun. This was another point for them to work upon and needing careful work, for Roman civil basilicas were by no means common in this country—we had only the two he had named, viz. those of Calleva and Uriconium—and to ascertain their size and arrangement was of the utmost importance in estimating the status of a Roman town. South of the basilica stand the public baths within a courtyard, originally no doubt lined by colonnades. They formed a body of buildings with two wings, the body being composed of a vaulted hall, entered from the basilica, with cold bath-rooms on either hand. Then comes an apodyterium, which was practically a lounge, where, in a mild temperature, the bather could cool himself after taking the hot bath and before finishing up with a plunge in the swimming bath. It was a place where any amount of gossip went on, and all the news of the city, its district, perhaps even of the province, was discussed. South of this chamber was the swimming bath, and from it the hot baths were entered, first in order those used as hot-air baths only, then those for hot water. The courtyard served for games of ball; the colonnades surrounding it for exercise and conversation under cover. This establishment of baths was second only for size in this country to the famous one at Bath, and quite equal in size and accommodation to many found on the Continent. At Calleva the public baths had, he thought, yet to be found. No Roman city was without them. Only half these baths had been uncovered; the eastern wing still remained beneath the surface of the fields, and its excava-tion offered a rich harvest of antiquities to the explorer. The whole of the excavations of 1859-61 had been but imperfectly worked out, and much clearance was required to show in various places what was only half revealed. He had said nothing of the houses of the town, for at present it was only certain of the public buildings which had been explored, but from the ruins being more deeply buried than those at Silchester they would probably be able to study the plans of dwellings to greater advantage than those of similar build-ings on that site. As to the chance of finding early churches, this was a better one than at Calleva, for the life of the town went on longer and its destruction was more sudden, as, having been plundered and burnt, it did not, as appears to have been the case with Calleva, perish of slow decay. Sudden destructions, though it may appear a paradox to say so, were more conservative of remains than slow decay, as witness Pompeii and the other Campanian cities. It would be noted, perhaps, that in this account he had spoken almost entirely of the buildings only of the Roman towns described, not of their contents, and this had been intentional. The minor objects in their researches came of themselves; there was no need to seek for them. What was of real importance was to understand the plan and character of a Romano-British town, and to deduce from what remained of its public and private buildings the nature and amount of the civilisation of its inhabitants. They would probably form a very imperfect idea of the condition of the people of these islands in the Roman period if they based their judgment only on the objects in pottery, metal, glass or bone found on Roman sites, and this had been far too much the case up to the present time; but when they came to the remains of buildings they could speak of the conditions of existence they showed with far greater certainty. As house and hall, law court and temple, bath and market, were revealed to them as they turned over such a site as that of Uriconium, they were content to leave for the delectation of the usual collector the pottery, pins, rings, glass and all the minor objects of antiquity he so much prized, content to learn in the truest way from the remains of the edifices left the customs, habits, even perhaps the forms of government of the people of our island under the Roman sway.

The resolution was carried unanimously.

Excavations conducted by Mr. St. John Hope on behalf of the Society of Antiquaries have been in progress in the garden adjoining the residence of the Bishop of Dover, in the precincts of Canterbury Cathedral. Five Early English corbels were found beneath the site of the old monastery dining-hall, similar to those recently found during excavations for the Archiepiscopal Palace. The discoveries go to prove that the whole of the buildings on this side of the cloisters were entirely rebuilt in the second quarter of the thirteenth century.

The Annual Congress of representatives of the provincial Art Societies of France was held last week in Paris, when no less than twenty-three papers were read. The Minister of Public Instruction presided at the closing meeting.

CORRESPONDENCE

Flanged Plate Safes.

What's all this fuss about? Is it needful to occupy your valuable columns in demonstrating *ad nauseam* the fact that under our laws the granting of a patent does not guarantee priority either of design or manufacture?

You need not have apologised for the "scantiness of the English technical vocabulary," when you seek to bring into notice the claims of rival safe makers.

Those who are old enough to remember the famous lock and safe controversy which helped to establish the reputation of the company I have the honour to represent, will know that the English language was put to a pretty severe strain over that historical contest, and in these days it is, as a rule, better to adopt the Carlylean doctrine that "silence is golden."

On the other hand it seems essential, under some conditions, "to rush into print" in order to enlighten the rising generation.

With reference to the question of bent steel safes, I cannot do better than ask you to insert an extract from a letter written by me on this subject, and published by your contemporary, the *Ironmonger*, in their journal of August 3, 1895.

"In 1868 a certain French nobleman, closely connected with the Government as a contractor, applied to Hobbs, Hart & Co., for designs for a safe 'that, while resembling in outward appearance safes of continental manufacture, should possess the fire-resisting qualities of a good English London-made safe.' We designed such a safe, the original pattern being turned on a hardwood mandrel. We accepted a contract to make and deliver in France 1,500 of them. We made patterns, and laid down a machine for bending the plates, and to this day seamless bent body steel safes have been our specialty. The original machine can be seen in our works. In 1882 we designed and spent over 1,000*l.* in making a machine capable of bending cold (with perfect accuracy) steel plates of almost any thickness such plates can be rolled. Not the least curious thing in connection with the matter is the fact that from the date of our initiation of the system, by which we condemned for ever the water-tank system of construction—*i.e.*, five plates held together by angle irons—our competitors have been trying to prove that our idea of construction was fallacious; but now almost every maker of repute is adopting the system of bent bodies in some form, and every advertisement emanating from the trade contains a notice 'that new and powerful machinery has been put down' to do such work as for the 'last twenty-seven years we have been engaged in.'"

The Rip Van Winkles of the trade may wriggle or resort to subterfuge, but the fact remains.—Yours truly,

CHARLES LEE,
General Manager and Secretary.
Hobbs, Hart & Co, Limited,

June 1, 1899.

Piscinas.

SIR,—In your Tesseræ of the 26th inst., the article on Piscinæ or Piscinas (to adopt the word frankly into the English language), seems to me quite erroneous. The writer says that the object of the piscina was fourfold (1) for the washing of the priest's hands directly; (2) for emptying into it the contents of the basin in which the priest had washed his hands; (3) for pouring out the rinsings of the chalice after holy communion; (4) pouring out "other substances (?) on occasions such as may occur to the reader without our specifying them—which reverence and decency did not permit to be thrown into a common place." The third of these uses is the only correct one.

1. Piscinas are not always calculated to hold water. Even if the hole were corked up the sides are not always smooth, but are often corrugated, and the hole is often hidden by a rose or floral adornment, under which are six or eight communications with the hole or tube, leading to the small blind well which underlies the piscina in the foundations of the church.

2. Piscinas are usually too small, and some too shallow, to bear pouring into them the contents of a washing basin. When lately in St. Andrews, Scotland, I noticed in the unroofed church of St. Leonard's a remarkably shallow piscina. The sill of the south window of the chancel formed a credence table, and part of it was incised for a piscina—a shallow square depression, not an inch deep where deepest, viz. at the south-east corner, where the hole is. There is a similar shallow piscina in Lucca Cathedral, which had been long built up but was uncovered in the restoration of the church. It forms a beautiful arched recess with a floor like a tray, with a fall towards its north-east corner. The piscina in the apse of San Miniato at Florence is shallow, although of the common circular form. None of these would hold water to wash the hands in, nor allow of a basinful of water being poured into them without overflowing. Besides, the blind well beneath most piscina—some spill outwards on to the ground—are so small that a daily basinful, perhaps several basinsful, would inevitably gorge it and choke the piscina.

And what reason is there for treating the water in which a priest has washed his hands as holy, requiring to be thrown out reverently? The idea of his washing his hands is to remove impurities, worldly impurities, so as to fit him to handle consecrated elements, and such washings can be thrown anywhere.

3. The rinsings of the chalice, however, contain consecrated wine, and for these rinsings only was the piscina used. They were small in amount, and the shallowest piscina could take them without splashing, and the smallest blind well would absorb them.

It seems to me a pity that in our many reversions to old uses that of the piscina is not adopted. It is a beautiful object in our churches, and the use of it for a reverential cleansing of the chalice after Communion is far more decent than the ugly Romish substitute by which the priest makes himself into a piscina by swallowing the rinsings of the cup, and which many of our clergy seem inclined to follow. They seem to prefer copying Romish innovations to making real reversions. The use of the piscina certainly obtained in England till the Reformation: churches built in the latest Tudor Gothic are furnished with them.

To give one instance. In Burston Church, in Surrey, a south aisle with chapel was added in Henry VIII.'s reign. It is separated from the nave by an arcade of four centred arches—very depressed, Tudoresque arches. In the south wall, near the east end, is a piscina, with arch of the same kind to the right of the altar-place, which is clearly shown to have existed by the corbels which supported its reredos. For I think your writer is wrong when he says that there are piscinas where altars have never been.

4. I cannot discuss your writer's fourth use, for I do not understand what he hints at.—Your obedient servant,

May 29, 1899. W. E. T.

GENERAL.

An Excursion Meeting of the Northern Architectural Association will be held to-morrow, June 3, when by permission of the Right Hon. the Countess Dowager of Scarborough and the rector, Lumley Castle and Chester-le-Street Church will be visited.

Mr. Brock's Statue of the Queen is to be placed in the hall of the Junior Constitutional Club, Piccadilly, in the course of the year.

Mr. T. S. Gleadowe, one of the inspectors of schools, has presented to the Chester Museum a collection of Roman, Saxon and Mediæval relics, including personal ornaments in silver and bronze, ecclesiastical objects, weapons of war, agricultural implements, &c., comprising several thousand rare specimens. They belonged to the late Charles Potter, of Liverpool, and were mainly derived from the coast at Meols.

The Collection of Drawings of the Old Masters now exhibiting at the Birmingham Museum and Art Gallery has been visited the first week by no fewer than 44,000 people.

The Emperor of Austria contemplates the erection of a block of residential flats in Budapest as a private investment.

Mr. Claude Marks, a nephew of the late Mr. Stacy Marks, R.A., has received an "Honourable Mention" for his first exhibited picture in the Salon. The subject is *The Prodigal Son.*

Mr. James Thomson, architect (Baird & Thomson), of Glasgow, announces that he has taken into partnership his two sons, J. Baird Thomson and W. A. Thomson. The firm will be continued under its old title.

M. Benjamin-Constant, the French portrait-painter, who has received a commission to paint a portrait of the Queen, will open in a few days at the Fine Art Society's galleries an exhibition of his most important portraits. These will include Mlle. Emma Calvé, the Duchess Paul of Mecklenburg, Mme. Houssage, M. Paul Sohège, Comte Henri Delaborde, M. Chaplain, M. Bertrand and Sir William Ingram.

The Offices of the Tribunal of Appeal have been removed to the new premises of the Surveyors' Institution.

A Paper entitled "Foreshore Protection, with special reference to the Case System of Groyning," will be read by Mr. R. G. Allanson-Winn at the meeting of the Society of Engineers on Monday next.

Sir Wyke Bayliss, P.R.B.A., will deliver a lecture on Thursday next at the Architectural Museum on "The Bogey in the Studio: an Address to Art Students on the Questions of the Day."

THE

Architect and Contract Reporter

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, Imperial Buildings, Ludgate Circus, London, E.C.

For Advertisement Scale, see page xiii.

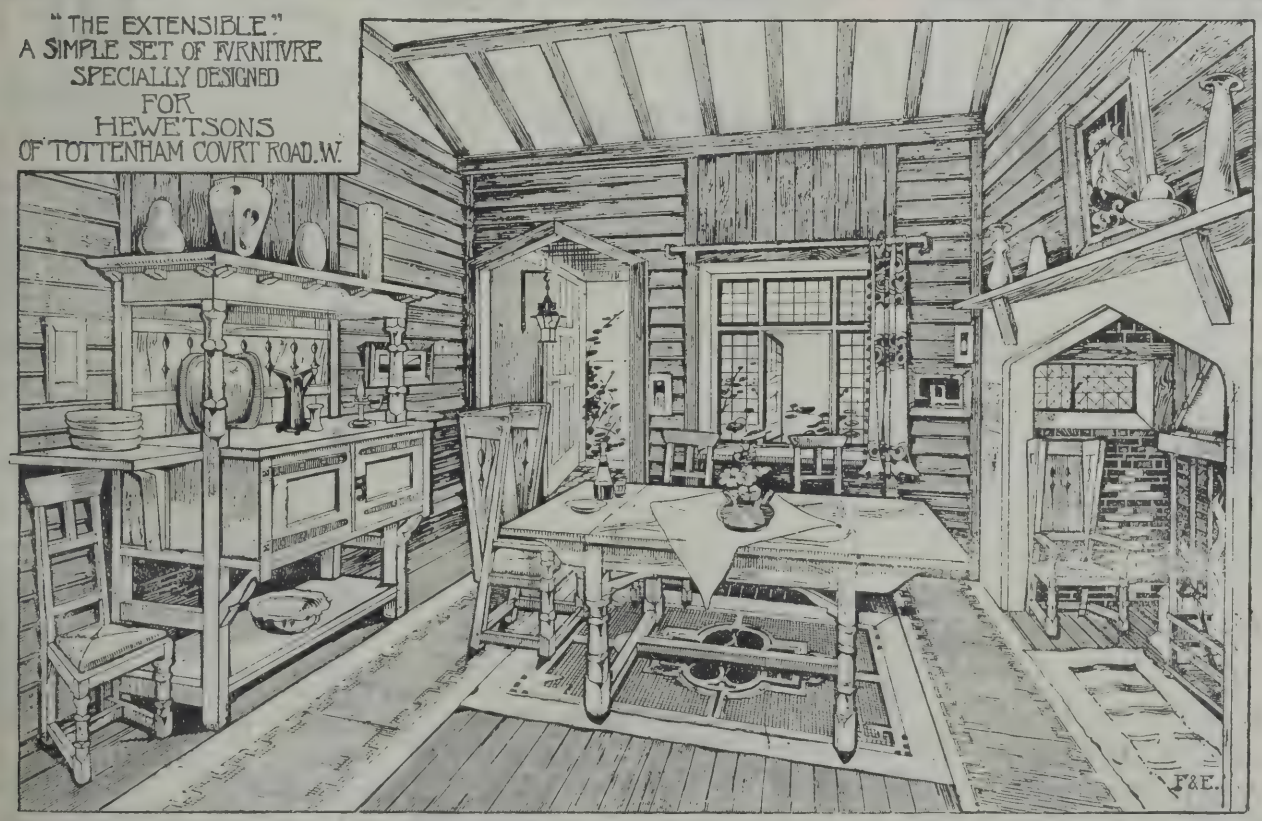
SAFETY GATES FOR HOISTS.



THAT the individual should bear any ill results arising from his own carelessness would appear at first sight an obvious conclusion, more particularly when actual carelessness, as differing from want of thought, brings about a catastrophe. But recent legislation has improved upon, or at any rate altered, this economic law, and employers are now made to suffer financially for the results of accidents which are entirely owing to the carelessness of their workpeople.

This being so, any means that may be devised that will not only minimise the risk, but prevent carelessness from bringing its attendant penalty, should be welcomed by all who employ labour; and the numerous accidents that occur owing to the improper use of hoists by workmen who not only have no business near, but who also are warned against the danger, makes the system of automatically closing the safety gates introduced by Mr. John Botterill, of Kirkstall Road, Leeds, a most valuable one. By its use accidents pure and simple are entirely prevented, as well as those brought about by the causes we have mentioned.

As will be seen by the accompanying illustration, the gates work in conjunction with the hoist automatically. The chain attached to the top of the gate passes through pulleys and over an arm which, when the hoist is not approaching or leaving a landing, is flush with the frame of the lift well; but when the cage is nearly in position for loading or unloading the arm is taken into a guide which is so designed (see illustration) that the gate travels at twice the rate of the cage, so that the gate remains as a guard until the cage is almost level with the floor. The opening and closing of the gates is regulated by the speed of the cage, and they are of such a height as to prevent the

HOTELS, CLUBS, AND PUBLIC INSTITUTIONS COMPLETELY FURNISHED.
HEWETSONS, TOTTENHAM COURT ROAD LONDON, W.

possibility of any person being caught between the gate and cage, or looking over the top of them, a frequent cause of injury. Opening perpendicularly, there is no fear of being drawn into or thrown down the well, as may happen with doors opening inwards or outwards, and in addition there is a saving of floor space.

When there are two openings to the cage on one floor the apparatus will operate on both gates at the same time if desired, and by a simple attachment the cage will open or pass any gate at the will of the attendant. This automatic safety apparatus, which embodies five patents, has already been applied to over 500 hoists, many of which have been adopted after satisfactory trials, and has also been approved by H.M. factory inspectors and the fire insurance companies.

SUN FIRE INSURANCE OFFICE.

THE directors of the Sun Fire Insurance Office are again in a position to place an eminently satisfactory report and balance-sheet before their shareholders. From it we gather that the premiums received, less re-insurances, amount to 1,029,595*l.* 3*s.* 11*d.*, being an increase of 17,254*l.* 15*s.* 6*d.* as compared with those of the preceding year. The total of the sums insured during the year, after deduction of the amounts re-insured, exceeds 430,000,000*l.*, being an increase of about 6,000,000*l.* on the corresponding figures for the year 1897. The losses paid and outstanding amount to 614,842*l.* 17*s.* 8*d.*, being at the rate of 59·71 per cent. on the premiums received. The expenses of management (including commission to agents and working charges of all kinds) amount to 357,743*l.* 0*s.* 10*d.*, being at the rate of 34·75 per cent. The income from investments during the year has amounted to 79,234*l.* 0*s.* 3*d.* After providing for the usual reserve of 40 per cent. of the premiums to cover liabilities under current policies, a balance of 129,341*l.* 7*s.* 5*d.* remains, which has been transferred to the credit of the profit and loss account, leaving a credit balance of 55,231*l.* 18*s.* 1*d.*, which, by the operations of the year, has been increased to 181,185*l.* 11*s.* 9*d.* Out of this an interim dividend at the rate of 4*s.* per share, absorbing 48,000*l.*, was paid in January last, and the directors have declared a further dividend of 4*s.* 6*d.* per share, payable on July 11, which will absorb a further sum of 54,000*l.*, leaving 79,185*l.* 11*s.* 9*d.* to be carried forward.

TRADE NOTES.

THE Eye and Ear Infirmary, Portsmouth, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

KATE'S HILL BOARD SCHOOLS, Dudley, now in course of erection, are being ventilated by means of Mackay's patent ventilators and fresh-air inlets (Cousland & Mackay, 150 Hope Street, Glasgow, sole makers).

WE have received from Messrs. Lumby, Son & Wood, of West Grove Works, Halifax, a price list of their "Pioneer Perfect Boilers," with a list of the churches, chapels, schools and public and private buildings where they have been fitted, and a number of testimonials, all of which express the most complete satisfaction with the efficacy of these boilers.

MESSRS. FAUDEL PHILLIPS & SONS, of Newgate Street, have obtained the order to light with acetylene gas Lord Pirbright's Hall, Brookwood, Surrey, which was opened on Tuesday by Princess Christian. The machine to be used for making acetylene gas is the Thornton-Scarth Automatic Lighting Syndicate's well-known "Thorscar," and about forty lights are employed.

IT is satisfactory to learn that London hospitals are now being fitted up with the most efficient means for the protection of the buildings and the escape of the inmates in case of fire. Among the most recently fitted is the Hospital for Sick Children, Great Ormond Street, W.C., with three Merryweather chute fire-escapes, affording rapid and safe means of egress from a building in case of an emergency. These escapes have been in use at a large number of hospitals for many years, and have proved invaluable in their application to life-saving. The Middlesex Hospital has also just been supplied with six "London Brigade" hand-pumps, by the same firm.

MR. C. F. DIXON, of 29 Ebbertson Terrace, Leeds, has sent us a set of price-sheets of his patent automatic flushing-syphon, for which it is claimed that there are no working parts to get out of order, no air-holes, vent-pipes or small tubes which are liable to become choked and so prevent the working of the syphon, that the bore of the syphon is in no part contracted, consequently there is no impediment to the free passage of the liquid, and that the flushing action is commenced instantaneously; his automatic trough flushing-closet, which is supplied in white or glazed ware; his automatic flushing latrine and various other sanitary fittings and appliances. The

BUILDING AND BUILDERS.

OUNDATION-STONES of a new Primitive Methodist church ave been laid at Cullercoats.

THE corner-stone of the chapel to be erected in connection ith the new Archiepiscopal palace adjoining Canterbury athedral, was laid on the 27th ult. by the Archbishop of anterbury in the presence of a numerous company.

A SCHEME for building a new Congregational church at winton, Yorkshire, at a cost of 1,700*l.*, is being vigorously ushed forward, and the Charity Commissioners have consented the sale of the old chapel, which has been used for years by ie Salvation Army.

AT the mining village of Denaby Main, Miss Montagu, of Ielton Hall, laid the foundation-stone of a new church, which to cost about 3,500*l.*, and will accommodate 500 persons. he building will be of local stone, with pitch-pine roof and red les. Mr. Fowler, of Durham, is the architect.

THE Bishop of Stepney has laid the foundation-stone of the ew St. John's National School, Bethnal Green. When finished, ie new school, which is to cost 8,000*l.*, will accommodate 672 ildren, and the central hall is being built according to the ondon County Council requirements, so that it may be used r entertainments and as a centre for the social work of the istrict.

THE standing joint committee of Dumbartonshire have st completed the erection of new police offices for the llage of Duntocher, situated on the Chapel Road there. The ilding, which is of white freestone, is two storeys in height. n the ground floor is the charge-room, with cells to the rear, hile adequate provision is made for the quarters of the sident officers.

THE plans committee of the Leeds Corporation, of which r. E. W. Batley is chairman, are determined to put an end "jerry"-building in the city. At a meeting recently held ey passed a resolution requiring all mortar used for building rposes to be of a minimum quality of one part of lime to two arts of good engine ashes or clean river sand. This decision on the part of the committee is the outcome of a report by Mr. Fairley (the city analyist), which document showed that numerous samples of mortar recently analysed by him had been very inferior stuff indeed. In future, whenever one of the building inspectors finds mortar being used by contractors which is of a doubtful strength he will submit a sample to Mr. Fairley.

A NEW deep-water dock is to be constructed on the river Thames at a cost of two millions sterling, and the north bank of the river at Dagenham, Essex, has been selected as a suitable spot for it. The vast scheme will be financed by one of London's actual millionaires, a gentleman of high repute in commercial circles, and the works are to be carried out without delay. The new docks are specially designed to facilitate the rapid loading and discharging of steamers by the adoption of every known labour-saving appliance. Sir Benjamin Baker and Mr. P. W. Meik have supervised the plans, and a contract has been placed with the firm of Sir John Jackson, Limited. It is estimated that the construction of the docks will take three years, and that by that time Dagenham will possess one of the finest and best equipped docks in the world.

IT has been decided to erect a new church in place of the present mission-room at Pentre, near Buckley. A convenient site has been given by Mrs. Lloyd (Sandycroft Farm) and Mrs. Drew, wife of the Rector of Buckley, has promised to build the church if the parishioners guarantee to find the furniture and inside fittings.

THE members of the general purposes committee of the Elland District Council were engaged on the 26th ult. in discussing important projects of improvements. A deputation, which had been to interview Mr. W. Lipscomb, Lord Savile's estate agent, with regard to the suggestion that the Town Hall Square be acquired, stated that he acquiesced in the proposition that public baths, a free library and markets be erected on the site, under certain conditions, and two of the Councillors were deputed to prepare the necessary plans. It is thought advisable to have a separate site for the electric-lighting plant which it is intended to erect.

AT a meeting held at the Bradford Stone Exchange on the 25th ult. the question of the formation of a society for the insurance of the various branches of the building trade in Yorkshire against accidents was considered It was reported that Leeds had not replied to the Bradford circular on the subject, but that a sympathetic reply had been received from

The metal sheets have expanded without becoming detached, whilst the wood is simply charred to a depth of about ⅛ of an inch."

FULL PARTICULARS AND ESTIMATES FREE.

Halifax. It was decided that the directorate of the Bradford Exchange should guarantee a fund sufficient to inaugurate a scheme of insurance for Bradford, and that further steps should be taken with a view to securing the co-operation of other populous centres in Yorkshire.

AT a meeting held at Salford Town Hall on the 19th ult. Colonel C. H. Luard, Inspector of the Local Government Board, held an inquiry with reference to an application of the Corporation for power to borrow 4,000*l.* for the purposes of erecting a public library. Mr. Evans explained, that the late Sir Percival Heywood had presented to the borough an acre of land, and had promised 2,000*l.* towards the cost of the new building. His son, Sir Arthur, had intimated his intention to keep the promise regarding the 2,000*l.* Mr. Alderman Mandley, as chairman of the museum, parks and libraries committee, said the scheme had been adopted after very careful consideration. The inhabitants, who were mostly colliers, would greatly benefit by the erection of such a building. Messrs. Worsley and Corney also gave evidence in support of the application. Mr. Worsley stated that the population of the district was 5,000, and the nearest library was fully a mile distant. The inquiry then closed.

ELECTRIC NOTES.

THE Leeds Corporation, with the view of developing their newly-acquired electric-lighting concern, think it well to tempt intending customers. They are going to supply current free of charge during June, July and August to those who become consumers within that period. It is hoped by this means to induce those who contemplate taking the new illuminant to have their premises wired and connected with the mains during the summer months, when the work can be done more conveniently than later in the year. Only one condition is imposed, and that is that the current shall be used with reasonable care.

AT a meeting of the electric-lighting committee of the Hull City Corporation on the 25th ult. Mr. J. T. Skinner, chairman of the committee, stated that during last year the consumers increased from 678 to 960, and there was on the year's working a net profit of 3,660*l.* He suggested a reduction of ½*d.* per unit on all units sold for lighting purposes only, and this met with unanimous approval.

VARIETIES.

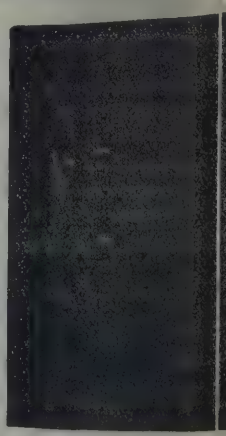
A NEW tabernacle which has been erected in Station Road, Rayleigh, Essex, was opened on the 24th ult.

THE Bishop of London consecrated on Tuesday the new church of St. Simon, Saltram Crescent, Paddington, a district which has been formed out of the parishes of St. Jude's, Kensal Green, and St. John's, Kilburn.

ST. JAMES'S CHURCH, Hampstead Road, has just been re-opened after thorough internal decoration and repair. The sanctuary floor has been raised and laid with wooden blocks. The walls have been panelled with carved oak, and a baldachino has been erected over the altar, with two paintings of censing angels above. Outside the church a wrought-iron structure of artistic design has been placed.

AT Boat of Garten, Strathspey, the ceremony has been performed of laying the foundation-stone of a bridge across the Spey to take the place of the chain boat which has hitherto done service in connecting the Duthil and Kincardine sides of the river. The structure has been erected by the Badenoch district committee of the Inverness County Council, but a considerable portion of the cost has been subscribed to locally.

THE architect's plans and specifications for the magnificent new Hall of Records for New York have been issued. They require 2,000,000 dols. to be spent on the external building proper, and 2,500,000 dols. additional to complete the interior. The estimate for sculpture is 85,000 dols., and for mosaic work is 10,000 dols. No wood whatever will be used, the interior being entirely of coloured marble and the window frames of copper. The mayor, the Board of Comptrollers and the city engineers are in favour of adopting the architect's recommendations.



THE fire authorities of the Paris Exhibition have served upon the British Royal Commission an objection to the Indian building, on the ground that it is unsafe. The British Commissioners decline even to discuss the question at this hour, which, they say, is three months too late for any such objection to be raised. The hitch is considered somewhat serious, as either the construction of the Indian building will have to be altered or the fire authorities must give way.

THE English buildings in connection with the exhibition will include the reproduction of an old manor house in Sussex. This will be allotted as the residence of the President, H.R.H.

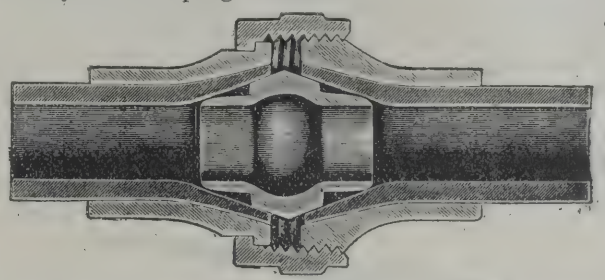
Vol. LX. of THE ARCHITECT. Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.

Prince of Wales. Whilst Mr. John Aird, who has the contract in hand, has undertaken to reproduce in every detail this interesting relic, it will be furnished in strict accordance with the fashion of the period.



AN interesting old London house is doomed to immediate destruction. The nuns who for the past thirty-seven years have occupied Harley House, Marylebone Road, leave this week to take possession of their new mansion at Brondesbury. Before the arrival of these sisters in 1862 the building was occupied by the Queen of Oude, who brought with her from India some gold idols as travelling companions, to say nothing of a suite numbering some 300 persons, the majority of whom lived in tents in the gardens attached to the house. It is expected that a block will be at once erected on this site, which is immediately south of Harley Street.

THE programme for the present season which has just been issued by the management of the Crystal Palace is a most attractive one, comprising important cricket matches, cycle races, athletic tournaments and gymkhanas, the National Horse Show and pony shows. A new and original *al fresco* attraction will be the production of one of those entertainments long popular on the Continent, but comparatively unknown in England, namely, a "Revue," the title chosen for the Crystal Palace production being "The Dream of Whitaker's Almanack," of which the libretto is by Henry Beauchamp, with vocal music composed by Walter Slaughter, Florian Pascal and Walter Hedgcock. Two great ballets have been arranged by Signor Coppi (late of the Alhambra) and Madame Cavallazzi (of the Empire). M. Georges Jacobi will provide the orchestral melody, and conduct a special "Revue" band of picked musicians. In this ambitious production a number of well-known and popular favourites will appear. Then there are the beautiful electric fountains, such as afforded so much delight some years since at South Kensington. The terraces are to be illuminated, in addition to the North Tower Gardens, and on Thursdays and Bank holidays there will be the world-renowned firework displays. The Article Club Industrial Exhibition, which was opened by the Duke of Connaught on Tuesday, promises to be a great attraction. There is to be, in addition to the ordinary series of high-class concerts, a grand performance of Mendelssohn's "Elijah," in which the principal vocal solos will be undertaken by Madame Albani, Miss Clara Butt, Mr. Ben Davies and Mr. Santley, and Mr. August Manns will conduct the vast army of three thousand performers, Mr. Walter W. Hedgcock presiding at the organ. Floral and horticultural exhibitions, and exhibitions of animals and birds, will be held at frequent intervals. New dining-rooms and a smoking lounge and musical promenade have been provided. The much-needed improvements in the catering have been carried out, and the railway companies are offering special facilities to season ticket-holders in the matter of fares, and to every one in an improved service of trains.

THE ANDERSON PATENT PIPE COUPLING.

A SIMPLE and expeditious, and at the same time inexpensive method of coupling pipes of similar or dissimilar materials is that which has been placed on the market under the above appellation. This coupling consists of a combination of brass union and cone joint, with rings of asbestos, rubber, or any other suitable packing. By its use the expensive wiping of a joint is obviated, and a better and more reliable joint produced, with the additional advantage that it can be at any time opened for inspection or cleaning of the pipe, &c.

As the illustration shows, the joint is effected by the coupling members being slipped over the two lead pipes which it is desired to unite, and the ends of the pipes are expanded until they fit the coupling members.

The joint-piece with the packing rings is then introduced into the expanded ends of the lead pipe, after which the coupling members are firmly coupled together by means of the coupler or union, which draws the expanded ends of the lead pipes into such close contact with the packing rings and the bearing faces of the joint-piece that a very tight joint is secured.

For the connection of a lead pipe with one of iron or other non-expansible metal the invention is of considerable importance.

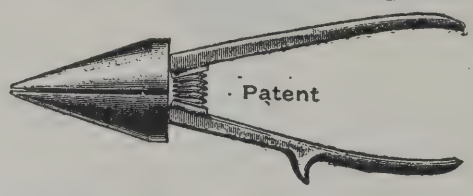
LARGEST MANUFACTURERS OF WOOD CHIMNEYPIECES IN THE KINGDOM.



Established over 20 Years.

The non-expansible metal is screwed or fixed into a suitable combination of joint-piece and nipple provided with a washer. The joint is then formed between the inclined outer face of the nipple, the expanded end of the lead pipe, and the inclined inner face of the collar, the whole being made tight by a suitable union. By means of this connection all direct contact is avoided and destruction due to galvanic action obviated.

In addition to its uses for joining pipes, the Anderson coupling has wide applications, such as in the connection of sinks, boilers, beer taps, &c

The following advantages are claimed for the Anderson coupling :—Extreme simplicity, as the connection can be made by an ordinary labourer in a fraction of the time required by a skilled plumber to wipe a joint, whilst any man accustomed to the Anderson coupling can make a complete connection in a very few minutes. It is absolutely tight, and does not leak when subjected to a test pressure of 1,300 lbs to the square inch. It has been in ordinary use under a pressure of 120 lbs., and various other conditions in America, where it has given complete satisfaction It is not affected by temperature or by vibration, which loosens couplings having no washers. It is cheaper than a wiped soldered joint, than which it is stronger and better. In the case of the wiped joint the connection once broken must be rewiped, whereas the Anderson coupling can be disconnected and made up again indefinitely without trouble and without injury to the connection. Wherever block-tin is used, as in hotel and public-house fittings, the use of the Anderson coupling enables the connection to be made without trouble. It reduces the risk of destruction by fire of buildings in course of erection and ships during fitting through accidents caused by plumbers' fires, as no heating is required for the application of this coupling.

The second illustration depicts the Anderson expanding pliers, a very useful instrument intended to supersede the old-

fashioned and time-wasting wooden cone for expanding pipe-ends. By this simple means the object is attained neatly, expeditiously and uniformly, and will be found of the greate possible value in conjunction with the Anderson pate coupling. The British patent has been secured by th Anderson Patent Pipe Coupling Co., whose address is Clu House, Surrey Street, Strand, W.C.

FIRE TESTS.

THE British fire prevention committee is showing further in creased activity at its testing station, and a most importan series of investigations is again in hand. Among these test is one with a floor of steel joists and concrete filling, the con crete being of the aggregate lately allowed by the Londo County Council. Another floor under investigation is a soli timber floor; a third floor by the Columbian Fire Proofin Company, U.S.A., which is to be subjected to very high tem peratures. Various forms of doors of wood, armoured woo and iron will be under investigation, also silicate partitions an ceilings by Messrs. Anderson and Messrs. Broadbent, some patented partitions and plasters, some plain electro-glaze windows by the Luxfer Prism Syndicate, and lastly, some of th non-flammable materials. A set of ordinary partitions hav also been recently tested. Nearly all the great publi authorities are now represented at the committee's tests, and a the last test representatives attended from the leading insur ance companies by special invitation.

Owing to the numerous applications to visit the station, th executive has asked us to remind would-be visitors that th attendance is still strictly limited to the members by rotatio and a few special guests.

TRAINING OF BRIDGE ENGINEERS.*

IN this short talk I thought that the subject might be handled most advantageously by dividing it into two main divisions First, taking up the manner in which these bridge enterprises develop, following the business forward through the natural steps to the actual condition of the work. Second, starting from college, giving the preparation required and leading up

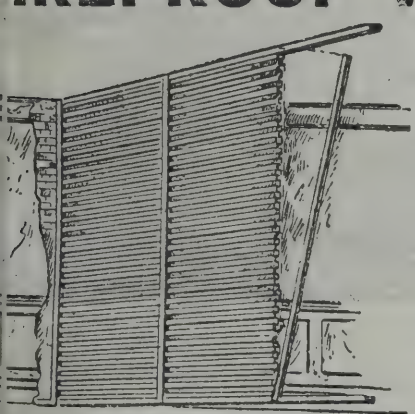
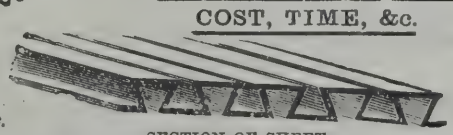
hrough the several stages of construction and business to the nception of the work.





Considering the first, bridge enterprises emanate from the ecessities and the demands of better transit facilities. The agacious railway officer or municipal authority turns naturally o those bridge companies or consulting engineers of acknowedged standing, character and ability for advice. Here we ome to the most important attribute of an engineer—a staunch haracter. He must be absolutely beyond reproach if he xpects to be eminently successful in his noble profession. The nterests placed in his hands are too vast and important, inolving the success of great enterprises, the expenditure of vast ums, the marring or beautifying of city streets and parks and istas, and involving also the safety of hundreds of human lives; these interests surely can only be trusted to the highest haracters. No profession demands more. This is a sufficient eason why a long successful engineering life is so honourble, and why we honour the great names in the profession. The engineer must be able to withstand the strongest pressure, and be able at all times to reach correct conclusions and nake truthful reports—be able to turn down without hesitation ny work, however tempting otherwise, which involves the xpenditure of money or character of design, quality of material r workmanship, which his professional judgment condemns. Sharp practices once entered into, work slighted, or false eports made, are not forgotten, and the engineer or firm so cting is more surely spotted and condemned than the uncrupulous lawyer or quack doctor. The profession is to be ongratulated that instances of breach of trust and professional lishonesty are rare. The report of an experienced and able ngineer should and does carry with it the same grade of uthority as a judge's decision, and it becomes the basis of uture actions and decisions. If all its members work on this igh plane of professional honesty, there need be no fear of the ltimate position of the engineer in the community and of his lace in the learned professions.

Assuming, then, the wants of the railroad company, munipality or state, and that an engineer is competing for the ork, he must be prepared to support his claim to attention ot alone through his technical knowledge, but he must be ble to present his case lucidly in good English, in a clear, onvincing manner; he must be shrewd to discover the main eatures of the business propositions involved, and to take dvantage of every surrounding condition. Engineers are ften spoken of as narrow, and as only being able to talk "shop." If there is any truth in this assertion it may be traced to a lack of a general and broad education in those branches and studies outside of his work. Whenever possible, let no opportunity be neglected which tends to increase your general knowledge, and which will assist in laying a broad and thorough foundation for a general education. I well know the feelings of the average technical student and his belief that time spent on the classical studies, history, literature and languages is in a manner wasted, or at least unnecessary. In after years a lack of training in these very branches will be keenly felt by the engineer in his effort to attract attention to his designs and plans. It may be assumed that all students here will take an interest in their mathematics, physics, chemistry, construction and other purely scientific studies, and I would strongly recommend the closest attention also to the classical branches as well. A profession full of cultured as well as thoroughly trained engineers need have no fear of its standing in the world at large, and that fees of proper size will be expected and paid as cheerfully as to the lawyer or doctor.

Assuming that the engineer has been successful in securing the business in view, he is now in the position of adviser, and must do the best for his client. It is not to be assumed that he has now the opportunity of exploiting his purely theoretical knowledge, but he must adapt himself to the surrounding conditions. An engineer has no more right to needlessly expend his client's money than a doctor has to needlessly drug his patient.

Many enterprises have been wrecked by a lack of due regard to the surrounding conditions. A good engineer is preeminently one who most carefully considers these surroundings and the practical features of the work involved. If the general market is furnishing a reliable class or grade of material which has been abundantly proved in practice under trying conditions it would be folly to force a special material, demanding special processes at greatly increased cost upon your client, simply to satisfy your craving for a theoretical metal. It is unnecessary to specialise further; I only wish to impress upon you the importance of avoiding carrying theoretical considerations to an extreme. You may succeed in making a monument to yourself, and there are a number of such that might be instanced, but they are not such monuments as are to be desired by any engineer. I do not wish, however, to lessen the value of giving the most careful theoretical consideration to every problem; it is far better to err on the side of extra weight and expense, as

was the case in the early days of bridge construction, when designing was more a matter of ingenuity and practical consideration alone, than a matter of theoretical skill. The successful engineer must combine the two.

Proceeding to the designing of the structures, the preparation of the stress diagram and the design of the general outlining of the structure, while calling for a high grade of ability and experience, demand, if possible, less experience than the detailing. This important work can only be left to the most painstaking and thoroughly trained engineers and draughtsmen. The requisite knowledge and experience cannot be imparted by books or lectures; it is only obtained by actual and prolonged experience over the draughting-table.

With the work designed and specifications written, it is ready for the construction in the mills and shops. Here the bridge engineer ceases to be the ruling factor; he should, however, maintain a close supervision of the construction, through a careful, intelligent inspection, during the various mill and shop stages, and final passing of finished parts; but in the rarest instances should he interfere with or dictate shop practice—it is the final result he is after, and he is not interested in the intermediate steps leading to this result. To check mill and shop results, full-size tests are often specified, mainly tests of eyebars; the result of these eyebar tests sufficing to satisfy the engineer that his structure is all right. This, however, has developed in many instances into a fad; it really adds but little knowledge as to the condition of the finished structure, composed of many members not eyebars. If general testing of various members is not done the testing of eyebars might be dispensed with.

With the work finished in the shop, there remains one more stage to the completed structure, a stage which has been neglected by the great majority of engineers, although it offers every inducement and opportunity for the exercise of every faculty of the well-trained mind, both in theory and practice. I refer to the erection of the structure at the site. The engineer, to properly take charge of this field erection, must be thoroughly trained in all of the previous steps—in the theoretical and practical education of an engineer. He must be familiar with the office to be performed by each member of the structure, the design and duty of each detail, and the method of shop construction, to the end that each part may be erected in such a manner as to develop the full value of the structure in all its parts. In carrying out this work the engineer must depend upon the skill and fidelity of the bridge erector.

These bridge erectors are little known and appreciated except by those who are brought into close contact with them. They are as essential to the success of the bridge enterprises as the skilled mechanic in the shop, and are composed of a body of hardy, active, fearless young men, leading a life which necessarily makes them rough; yet they are tender-hearted to a fault to those in trouble. They are men, in other words, you can depend upon to stand shoulder to shoulder with you in all your efforts, stand by you in storm as in sunshine, work for you day and night without rest, if necessary to make a connection safe, when threatened by storm or flood. I number among them many of my best friends. If in this stage of the work the bridge engineer is not able to command the support of the best bridge erectors, he is in a sorry plight indeed; no amount of theory or individual ability will offset this lack. It is a case of practical experiences and acquaintances and the ability to command the respect, interest and real devotion of this peculiar class of workmen. When you have once gained their confidence you have assistants who will accept any privation and danger willingly for your interests. It is not easy for all men to make even passing acquaintances, much less to accommodate themselves to those in "various walks of life" with whom they are necessarily brought in close contact. The successful engineer, however, must have this ability; if not natural, it should be cultivated at every opportunity. Start in early—you cannot begin too soon—in your visits to shops and important works in course of construction during your college course; become acquainted with not only the officers in charge, but meet the workmen, if possible. Do not make the terrible mistake of thinking it may detract from your own standing as an educated engineer to associate with intelligent workmen, to talk with them in detail of their individual work and to be interested in their remarks. Nine times out of ten they can give you valuable information, which will be of use to you in your practice of the profession. As has been previously intimated, the field erection of structures demands the exercise of all the faculties of the engineer, his theoretical knowledge, his practical business training and his ability to handle men; not only workmen, but the handling of inspectors and engineers.

It would be interesting if we had before us the original reason or idea for the selection of an engineering life by each of those present here to-day. In my own particular case I believe it was my fondness for outdoor life and the accidental associations with a field party of bright young engineers during
